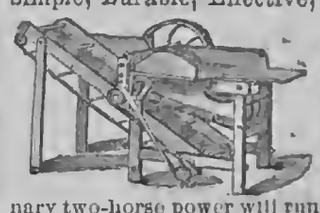
145 So. Clinton St., Chicago.

PHILIP'S SPIRAL CORN HUSKER.

Simple, Durable, Effective, and works rapidly.



This machine, improved and perfected, does its work thoroughly, picking the corn from the stalk and stripping every ear, large or small, soft or hard, completely of its husks and silk. Any ordinary two-horse power will run it.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

A. C.—Will you answer the following questions in your valuable paper :

(1) Are refuse hops good manure for the vegetable garden or for flowers, either in pots or beds, and if so, how does it compare in strength with stable or cow manure? and should it be thoroughly rotted before using?

(2) I have been experimenting to-day a little with hops in striking cuttings. I took small boxes, say 3½ inches deep and 5 inches wide, and put about an inch deep of hops in the bottom, then filled up the boxes with good sand, and placed the cuttings about an inch or inch and a half deep in the sand and set them in the sun. What do you think of the plan?

(3) Is malt good for manure? and should it be rotted before using? I live near two breweries, and can get all the hops I want and some malt for carting it away. My land is rather a loamy clay, with a stiff clay subsoil, and inclined to dry out towards the latter part of summer. Last fall I put four good two-horse wagon-loads of manure on about one-third of an acre, after the first plowing, and plowed it three times after and planted in corn. The most of the manure did not rot; but had about an average crop—very little if any better than the year before. Would it help it any to put lime on it this fall; if so, how much to the acre?

(4) What makes my chickens eat their feathers? They will pluck the feathers from each other and eat them greedily. I keep them in a pen or lot, 32 x 100 feet, and they have plenty of gravel and mortar, or plaster, broken up, and plenty of good, fresh, pure water to run to all the time. Their feed is corn in the morning and boiled potatoes at noon. They are turned out every other day to run in a field of two acres, and are in good order. They are of the Brown Leghorn, mixed with Polands. There are about forty of them, old and young.

ANS.—Hops are considered valuable as a fertilizer; but when used fresh from the brewery, they ferment quickly, generating almost as much heat as fresh horse manure. The gardeners about New York use hops for their hot-beds, also for banking them up on the outside in cold weather, mulching for small tender plants, and for composting with other less heating kinds of fertilizers. But before hops can be absorbed by plants as a fertilizer, they must become soluble in water, the same as any other kind of manure. Consequently, the more thoroughly decomposed before applying the sooner will they be used by the growing plants. Still, the hops mixed in the soil may have a mechanical or chemical influence highly beneficial, independent of their manurial value.

(2) We think that your experiment with cuttings set over a layer of hops, will do little better, if any, than in pure sand.

(3) Yes; malt will answer for manure, but we would mix it with some other and coarse material; for instance, add the malt to the compost heap to hasten decomposition and fermentation.

(4) Filthy hen yards will sometimes generate lice or disease of the skin, and hens then get into the habit of eating or plucking feathers from each other. To cure, see that the house and yard are clean, and give fresh meat and clean, pure water, with a heap of dry ashes in which the fowls can take a dust-bath daily.

Invalid asks our opinion as to the healthfulness of various kinds of food. She disagrees with Mr. PECK in his qualified advocacy of pork as a healthful food and advocates "an exclusively vegetable diet."

There is probably as much bosh written upon dietetic subjects as upon any other. The trouble is, that this class of hobby-riders are too fond of making a universal application of what is only valuable for special purposes. Most of the foods usually eaten are healthful, if taken in reasonable quantities and adapted in gross quantity to the needs of the individual. Thus pork for a man who labors hard from morning until night, in the open air, is as good as any other food for *him*. For one of sedentary habits, it is perhaps the worst. The greater the expenditure of force, the greater necessarily the exhaustion of the system and the greater, therefore, the need of concentrated foods. It is our opinion that living in strict accordance with the blue rules laid down by ultra dietetists is calculated to work as much injury as if people, unguided by any special rules, eat and drank pretty much whatever they choose. In all the pursuits of life, whether in matters of religion or of intellectual culture, of manual labor, or of the gratification of the appetite, it is excessive devotion, application or indulgence which induces disease. It is a miserable, narrow and timid philosophy that would restrict a man in his diet to a tithe of the good things for which his nature craves and which, if taken in moderation, are more nearly what he really needs to insure his best health than can be dictated by those fanatics who, unless we live upon air and shavings and deprive ourselves of half the pleasure of existence, are positive that epilepsy, apoplexy, paralysis or some other frightful disease is hovering over us as buzzards over carrion.

Dry Goods, &c.

LORD & TAYLOR
NEW YORK.

OUR FALL IMPORTATIONS
ARE NOW COMPLETE IN ALL DEPARTMENTS, AND PRICES ARE VERY LOW. OUR STOCK OF

Traveler's Guide.

CALIFORNIA.
Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oskosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO
via Cleveland.
Leaves Erie Railway Depot, foot of Chambers St. New York.
9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.
7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars
The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Officers of Agricultural Societies and Clubs, Granges &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Wit and Humor.

THE LORD BISHOP.

THE following "poem" was written by a farmer on the occasion of a visit by the Lord Bishop to a country parish, and was actually sung by the choir:

Why skip ye so, ye little hills,
And wherefore do ye hop?
Is it because ye do expect
To see the Lord Bish-op?

Why hop ye so, ye little hills
And wherefore do ye skip?
Is it because ye do expect
To see the Lord Bish-ip?

Why hop ye so, ye little hills,
And why do ye jump up?
Is it because ye long to see
His Grace the Lord Bish-up?

Why jump ye so, ye little hills,
And wherefore do ye leap?
Is it because ye eager are
To see the Lord Bish-cep?

THE REASON WHY.

ONE gentleman observed to another:

"I have a wife and six children in New York, and I never saw one of them."

"Were you ever blind?"

"Oh, no," replied the other.

A further lapse of time, and then the interrogator resumed the subject:

"Did I understand you to say that you had a wife and six children living in New York, and that you had never saw one of them?"

"Yes, such is the fact."

Here followed a still longer pause in the conversation.

"How can it be that you never seen one of them?"

"Why," was the answer, "one of them was born after I left."

SPARKS AND SPLINTERS.

A THEOLOGICAL student, supposed to be deficient in judgment, was asked by a professor, in the course of a class examination, "Pray, Mr. E—, how would you discover a fool?" "By the questions he would ask," was the rather stunning reply.

"Jones, if there were burglars in my house, and I knew it, by jingo, I'd——" "Well, Smith, what would you do?" "I would do whatever they required of me. I never had my way in that house yet, and it's too late to commence now—yes, too late."

AT the Centennial, the Philadelphia ladies cry out, "Isn't it cunning?" New York ladies. "How superbly lovely!" Boston ladies, "Ah, how exquawsite!" Louisville ladies, "Be-utiful, fo' shuah!" Chicago ladies, "Oh, my—I wish I owned that!" while the genuine Yankee girls from the rural districts exclaim, "Gee-whimminy, but ain't that 'ere a stunner, neow!"

A PROVIDENCE boy went to a birthday party, and describes it as follows: "First, we all had some bread and butter; then we had some lemonade, cold enough to freeze us; then we had a piece of birthday cake; then we all had lots of ice cream; and then we all had the stomach ache; then we all lay down, and the big girls gave us some peppermint; then we all went out to play."

A SAGACIOUS COLLECTOR.—Horace Greely used to tell this story:—He once sent a claim for collection to a Western lawyer, and regarding it as rather a desperate claim, told the attorney if he collected it he might reserve half the amount for his fee. In due time Mr. Greely received the following laconic epistle: "Dear Sir—I have succeeded in collecting my half of that claim. The balance is hopeless."

IT iz a grate deal cheaper to work than it iz to beg; enny man kan earn two dollars while he iz begging one. The most painful reckolecksh un ov mi life waz the time spent when I waz a boy, waiting to be whipt. If a man slips from the top round ov fame's ladder he haz got to fall to the bottom; there iz no haffway house. In most arguments the truth iz lost sight ov; the partys roll up their sleeves and go in simply to win. There iz a grate deal ov bogus humility floating around, the most humble kritter you ever see iz a hornet, who haz lost hiz stinger. —(Billings.

LET every father buy his boy a pistol. It is wonderful what a world of amusement there is in it. The boy may shoot some harmless bird, a pig, a cow, a horse, his little sister, or maybe himself. Here is a horse case right at hand from an Eastern paper: "Three boys, who were practicing with a pistol at Hartford the other day, accidentally shot the trotting mare 'Maybe,' inflicting a wound that will probably prove fatal. The animal has a record of 2:23, and is valued at $10,000." Cases where boys shoot their little sisters or themselves are too common to need the reference of any case at hand.

BAD FOR THE DOGS.

INTELLECTUAL CREATURE—"No it's utterly impossible for a fellah to stand this disgusting weather. I feel as though my bwains were going to the dogs."

LADY—"Dear, dear! Poor, poor dogs!"

USE ONLY THE BEST.
THE RUBBER PAINT
IS THE
BEST PAINT IN THE WORLD.

There is no Paint manufactured that will resist water equal to it. It is Smooth, Glossy, Durable, Elastic, Beautiful and Economical; and of any shade from PURE WHITE to JET BLACK; and as evidence of its being the *BEST PAINT* the necessity of their establishing the following Branch Factories will abundantly testify.

[Entered according to Act of Congress, in the year 1876, by the Rural Publishing Company, ' . the office of the Librarian of Congress at Washington.]

The Horseman.

THE ORLOFF TROTTER.

THE very interesting article from the pen of Mons. JULES GOUJON of Moscow, Russia, on the Orloff Trotter, which was published a few weeks since in the Spirit of the Times, has turned the thought of American horsemen to the dominions of the Czar of all the Russias. Believing that many of our readers might feel interested in these noted horses, we give the accompanying illustration of a Droschka — a vehicle used in the trotting races in Russia. Heavy sulkies are sometimes used, but the clumsy, four-wheeled Droschka shown has the preference. The Editor of the Spirit of the Times remarks:

They are not, however, as heavy as one would imagine from the picture, weighing but a trifle more than seventy pounds each. The progressive horsemen of Russia use the sulkies and appreciate the advantage of the two-wheeled vehicle, but there are many owners with whom prejudice is patent, who content themselves with saying, "We have always used the Droschka, and we always will." The cut below represents a rather old-fashioned vehicle, the Droschka of two years ago. The modern ones have the wheels nearer together. They are made of hickory, imported from this country, and cost about 150 roubles ($187.50). It will be observed that the wheels are very low, those forward being about 20 inches in diameter, and those behind about 30 inches. This brings the driver very close to the ground. He rides with his feet against the forward axle of the Droschka, and in his lowly position must receive quantities of mud and dust from the feet of his trotter. Indeed, these vehicles, on a heavy track, accumulate enough mud to make a sensible addition to their weight; but these points are not considered as important in Russia as in America, for the races there are generally driven at catch-weights. The exception to this rule is races where the Government gives the prizes, when a stipulated weight is required. The most striking feature of the rig depicted below is the hoop over the neck of the horse. This institution is a relic of the dark ages, but has been religiously preserved in Russia. It is of no use, except to hold the thills together, which could be done much better in other ways; or to hang a bell in, desirable for sleighing, but not done, of course, when a horse is trotting a race. The retention of this unsightly hoop appears to be due to the inertness of the Russian mind, which begets a disinclination to move out of the old ruts. The fastest time ever made by an Orloff trotter is five minutes for three versts, or two miles, and when we state that this time was made to one of these ungainly Droschkas, it will be seen that the merit of the performance is much enhanced. In a race of that distance they calculate that a Sulky is six seconds faster than a Droschka; but the owner of the horse which made the record mentioned is one of the high-bound Muscovites who will not change from the Droschka to the lighter vehicle.

Mons. GOUJON, being a native of France, has none of these Russian prejudices. He has purchased a Sulky of the most approved style and a large assortment of gear for trotters of all descriptions. When he returns to Russia, he will not only be prepared to instruct horsemen there as to all our ways of doing things in connection with trotting, but will be provided with a great deal of paraphernalia which will speak for itself. While in that land the Trotter is the national horse even more than he is in America, they are wofully behind the age in many respects. That this is the case, no evidence is needed beyond the fact of their still using such clumsy four-wheeled carts for their races. But we anticipate that the visit of Mons. GOUJON to this country will go far toward reforming their customs. He was particularly struck with the superiority of our conveniences for taking care of horses in the stable, and has informed himself thoroughly in all such matters. The Trotter is his specialty, and when he returns to the land of his adoption it will be as a missionary to those whose eyes have been blinded by inertia and prejudice. When his light Caffray Sulky is once seen on a Russian race-track, we think it will not be long until they come into general use, and that such abominations as the clumsy vehicle below will soon be discarded altogether. When this comes about, and when other advancements in the science of training and driving trotters are understood and adopted in Russia, we can see no reason why the horses of that country should not be equal to ours in speed, as they already are in all other desirable qualities. Indeed, we think there are few American trotters which could pull such a wagon as is depicted on this page two miles in five minutes.

RUSSIAN DROSCHKA AND ORLOFF TROTTER.

Farm Economy.

THE CHINESE QUESTION.

The real wealth of any country comes from the cultivation of its soil. The great need of this country is productive agricultural labor. How to obtain it with greatest advantage to all concerned is one of the problems yet to be solved. The United States have an area of more than three millions of square miles and a population of about forty millions. Up to the present time it has been the policy of our Government to encourage emigration, for moral, political and financial reasons. The land of Freedom should be the refuge of the oppressed and the home of all who desire advancement. It has been hoped that from the combined wisdom of all nations a system of governmental policy would be deduced better than the world has ever known. Every worker of the soil produces from it more than is necessary for his support. It has been estimated that the arrival of every immigrant adds, prospectively at least, a thousand dollars to the wealth of the country. Men of all nationalities have consequently been welcomed, and citizenship offered on easy terms.

But now comes from the Pacific Coast a cry of alarm. California clamors concerning Chinese. Laborers were needed, and from China they came. But they have come in such numbers, and with habits of life so different from those of Americans, as to awaken alarm in the minds of some of the Californians, and now Congress is asked to take measures to restrict immigration.

So far as we understand it, the principal objections to the Chinese are:

They underbid laborers of other nationalities in the price demanded for their labor.

They do not come here with the intention of becoming citizens, but leave their families behind and send home their surplus earning—thus draining the country of its wealth.

If they die here their bones are taken back to China.

They herd together in great numbers, and by this and their habits of life invite disease.

They are immoral and licentious in the extreme.

Being heathen, they have no regard for Christian institutions, and as witnesses do not observe the sanctity of an oath.

That they do not desire citizenship, and consequently have no interest in the public welfare.

If immigration is not restricted they will come in such numbers as will exceed the white population, and becoming voters, will imperil "the very existence of our civilization and the permanence of Republican institutions."

Now, who and what are these Chinese that bid fair to make us so much trouble?

The Empire of China comprises an area nearly double that of the United States, extending over twenty degrees of latitude. Its inhabitants number more than four hundred millions. Its history runs back thousands of years. Its religion, or rather its creeds and doctrines, are founded on the writings of CONFUCIUS, who died long before the birth of CHRIST, but who is still regarded in all nations as one of the leaders and teachers of the world. Its Government, nominally a despotism, has passed through various phases necessary for all Governments that continue long, and has finally succeeded in employing the organized intellect of its people for its direction and maintenance. There is no nation in which education is so generally diffused. It is expected that every Chinaman shall know how to read and write. The public offices are filled by successful candidates who have prepared themselves to take part in competitive examinations, and they are not discharged with every turn of a political machine. The positions are open to all. Merit and capacity are the only roads to promotion. It is intended that intellect shall govern.

As a rule the people are industrious, temperate, economical, intelligent and ingenious. Some say that their morality will compare favorably with that of other nations. This we doubt. Where Polygamy is allowed and girl babies are drowned with as little compunction as kittens, morality must be at a low point. They are a nation of gamblers, are given to the use of opium, and are indisputably licentious. Their habits of cleanliness are paradoxical, for while individually they show much desire for a cleanly appearance, congregated they form as filthy a set as the world knows. Before the successful endeavors of Christian nations to force commercial relations upon their Government, they were content to be a world by themselves and desired no intercourse with others. Our Government joined with others to break up this exclusiveness, and invited their commerce and good-fellowship. The request for inter-relation did not come from the Chinese, who would now gladly return to their former state of seclusion if they might.

Of this people are the immigrants to which California objects. They are not from the best classes, probably not from even the middle ranks of society, but occupy the same position at home as do most of the Germans, Irish, Italians, etc., who flock in such numbers to our Eastern Coast. Should their further immigration be invited or discouraged? Let us briefly examine some of the objections made to their coming.

It is said they work for less wages than others would ask and receive were it not for their interference.

Shall Congress determine what is a day's work and how much shall be paid for it? Are not many women doing work for less than men receive for the same? If a white man spends 50 cents a day for his sustenance and a Chinaman is satisfied to live on what he can procure for 20 cents, should the employer be assessed for the difference? "Friend, as I live, I cannot sell thee a hat for your price," said a Quaker to a cheapening customer. "Then live cheaper," was the reply. "Thee is the first who hast discovered my secret," said the Quaker, "and shall have the hat." The introduction of labor-saving machinery has always met with objections from certain classes and with the same argument—that such machines would do the work formerly done by men, who would by their introduction be deprived of opportunity to earn a living.

They expect to return to China and take with them their savings, thus draining the country of its wealth.

But if they give value for the money they earn, most of which is spent for their support, how can they by carrying the rest away render the country poorer? True, it would be better if all the wealth of the country could remain here, instead of being taken abroad, whether by returning Chinese or to pay for articles of foreign manufacture that we could just as well do without.

The bones of their dead are taken back to China.

Very true. But as Government does not intend to go into the Phosphate business, we see little harm resulting from that.

That there is danger of their ever out-voting the whites and getting control of the Government is doubtful. It is held as an objection to them that they do not desire to become citizens. And so far as the political question is concerned it is to be hoped that the intelligence of the American people will soon see the absurdity of universal suffrage and make such changes as seem to be necessary for the protection and welfare of the country.

They are heathen. True, and their condition in another life may be materially influenced thereby, but in practical, business affairs of this one it doesn't seem to make much difference.

The other objections seem to relate to matters more directly under the control of the City Government of San Francisco. That the Chinese do not bring their wives and families is true; "pity 'tis 'tis true," for evil doubtless results from the omission. Immorality and licentiousness exist in the Chinese quarter to an alarming extent. Gambling is universal among them. They congregate in masses and live in such narrow apartments, filled with the fumes of opium and the stinks from all kinds of filth, that it is wonderful disease is not engendered of sufficient potency to sweep them all out of existence. But San Francisco has the power to regulate the lives and actions of all within her limits. If it fails to do this, whose is the fault? But it cannot be done by passing laws not to be enforced or intended to be enforced against Chinese, while whites are excused. Nor are policemen, whose only pay is the contributions of those they are sent to keep in order, very likely to be extremely strict in the performance of their duties.

We have spent considerable time in examining this matter, and while admitting that the case may require heroic treatment at the hands of the legal authorities, must believe that the objections to further immigration arise mainly from three causes:

1st. Race hostility, which seems to be natural. 2d. Individual animosity, usually engendered by some pecuniary cause. 3d. An ignorance of the laws of political economy.

A few years ago Know-nothingism was rife in the East. It had its rise in political ambition and aspiration on the part of some who desired to lead. It could not be maintained because it was in conflict with the first principles of Republican institutions. But the most rabid Know-Nothing never suggested prohibition of immigration, and no legal action for keeping out Chinese can be had that will not apply to people of every foreign nation. This country is for all. What will be the result none can tell. The intermixture of European nations with Americans has so far done no harm. That with the Indian and African is too little and the progeny too wanting in vitality and power of reproduction to demand serious attention. There seems to be no indication of any more with the Mongolian. But whatever the end may be, it will be right. The whole universe—organic, physical and mental—is subject to natural law, against which our strongest efforts avail nothing; and whatever countries may contribute to the population of our own, or however they may cross, merging the peculiar traits of different nationalities, the result will be proof of the truth of the doctrine of the survival of the fittest. L. A. R.

The Apiarian.

LOCATING THE BEEHIVES.

There are almost as many different opinions in regard to the best exposure for an apiary as there are apiarians. The Agricultural Gazette (Eng.) has something to say on this question, which is probably as applicable here as abroad.

"After procuring a colony of bees, the next step to be taken is the selection of a suitable site in the apiary or garden designed for its abode. This must be done previous to the removal of the colony, but a decision on the point need not be come to hastily, as the vendor of a hive is willing, in most instances, that it should remain where it is until the purchaser finds it convenient to have it removed to its future home. Besides, transport, for fear of the combs collapsing, should not be attempted during such hot weather as has recently prevailed. Nor should it be thought of (if the distance to which the hive is to be carried is less than half a mile) until the middle or end of October, or until the temperature has fallen for a few days below 45°; otherwise serious loss of bees may be sustained through their finding their way back to the locality from which they came, and never returning. In ordinary seasons September and October are both good months for the conveyance of bees.

It is necessary, however, for their health that shortly after completing their journey they should have one or two fine days on which they can go out and relieve themselves of their business and of their burdens.

The disturbance created by transport causes every bee to fill itself with honey, and the condition thereby induced is unfavorable to lengthened confinement.

We can always calculate on a fine day occurring after a short interval, in autumn, but one suitable for bee-flight may not happen in winter till after the lapse of several weeks. If bees eat freely, and are constrained by an inclement atmosphere to remain long within doors, evil consequences follow. This is what sometimes causes the death of winter-moved hives. But in September and October enforced confinement is of short uration, and those who are just commencing bee-keeping may have their hives brought home at an earlier or later date as they deem most agreeable.

For a site the best is in a place sheltered on all sides from winds, without excluding the rays of the sun. If this cannot be had, the next best is one screened from the south-west, west, and north. In a garden surrounded by a low wall, we would plant a hive 3 or 4 feet in front of the north wall, and nearer to the west wall than the east one. If the wall were very high, and sent back a strong reflection at mid-day, we would plant the hive at a distance of 3 or 4 yards from it. But for greater ease of flight to bees over a high wall in every direction, a site near the centre of the garden is preferable.

It is difficult to give instructions applicable to all places; the most eligible situation, and least exposed to gusts of wind and eddying currents, must be discovered by observation and experience. Any mistake made at first in finding it can be afterwards rectified.

On a dry soil, 9 inches is sufficient hight for the hive to be raised above it, and if the hive, like those of cottagers, rests on three or four posts driven into the ground, each post should be nearly 2 inches from the outer edge of the floor-board to make the ascent of mice difficult or impossible. The floor-board need not be fixed, but to prevent accident from a gale, cords crossed at right angles, and passing over the hive, may be tied to the posts.

Let the hive incline a little in front, to throw off rain, and on the ground before it let nothing higher than strawberries be grown, as bees in going out to the fields, and returning home not only dislike obstructions in their way, but have their labors thereby impeded.

It is desirable also to have a currant or gooseberry plot near a hive, that swarms issuing may be tempted to go thither and settle on one of its bushes.

With an arrangement of this kind emigrants rarely fail to be arrested, and they will hang for hours when they happen to be well shaded. Rain-drops from overhanging trees falling upon and around a hive are injurious, from the damp which they occasion. Shade may be used to any extent that does not intercept the sunshine from 10 A. M. till 2 P. M. during the winter months.

With regard to aspect different views are entertained, some advocating one point of the compass and some another.

We have tried all kinds, and the conclusion we have come to is this,—that there is none superior to the one that allows the sun's rays to shine directly in the entrance of a hive at 11½ A. M. There is not a difference of consequence between a South-South-east or South-west aspect, and selection may be left to taste. But we disapprove of an east, west, or north aspect. They are very trying to the capability of bee endurance. The inmates of a hive, with a bright sun playing upon its entrance and ground in front for three or four hours, can often in the depth of winter go out and keep themselves comfortable and healthy, whilst those which have the doorway of their domicile facing north are unable to do so. In mild localities, any aspect from east by north to west may answer; but in high latitudes subject to severe and long continued frosts it is not suitable, causing, as we have seen in some seasons, the greatest distress. Besides, a northern aspect offers little or no advantage in the way of food consumption; its demands are heavier than a southern one when the population is small.

Whether a person commencing bee-keeping should set up an apiary with only a single stock, or with two or more, depends a good deal on his aim and object. If his main purpose is to get acquainted with the mysteries of bee-keeping, he would do well, if he has to grope his way unaided, to give his undivided attention to a single stock. Should a frame-hive be his choice, and the inspection of its combs be contemplated, either frequently, or at any hour of the day, he will, by having his hive isolated and far removed from others, escape those dangers which are apt to be created by the presence of stranger bees. These bees, when near, being attracted by the scent of honey, come to combs exposed and lifted out for examination, and, on tasting their sweets, are tempted to make a plundering raid; or they may, through getting introduced into a wrong hive, with the replaced combs, assassinate its sovereign.

To get speedily into possession of numerous hives, and have a larger harvest of honey, it is best to begin bee-keeping with two stocks, sited as far apart as circumstances permit.

One of these might be a common skep, intended for natural swarming—the other a frame-hive devoted to the purpose of making artificial swarms—or receiving a super. In case of accident two stocks are desirable.

We had two this season, which appeared equally populous and flourishing in the beginning of June; but before the end of the month, one shot far ahead, and in July not only gave out swarms, but also filled a super. The other did neither, owing to its queen dying from age or sickness on June 22.

Two weeks were required for the production of another sovereign, and three weeks more for the hatching out of the earliest of her offspring. The hive consequently, whilst daily losing its older bees, had no addition to its numbers from young bees during the whole of that period; and as the honey-gathering season was over before it had fairly recovered itself, it proved of no more value than an early swarm."

INOCULATION OF THE VIRUS OF THE STING OF BEES.

A GENTLEMAN of England, Mr. G. WALKER, performed upon himself the following experiments in order to ascertain the length of time, and the number of stings required so to inoculate his sytem that additional stings would produce neither pain nor swelling:

"I went to one of my hives, caught a bee, placed it on my wrist, and allowed it to sting me, taking care that I received the largest amount of poison by preventing it from going away at once: then I let the poison-bag work, which it does for some time after being separated from the bee. The first day I only stung myself twice. A bee sting has always had a very bad and injurious effect on me, inasmuch as it has always caused a great amount of swelling and pain: in fact, once when stung on my ear, the part became so painful and swollen that I hardly got any sleep the following night, and it was three days before I recovered. The first few stings I got during this experiment had the usual effect: the whole of my fore-arm was affected with a cutaneous erysipelas, and there was disorder of the muscular nerves, accompanied with heat, redness, swelling, and pain. This attack lasted till Tuesday, and on Wednesday (October 7th) I was so far recovered that, following the same plan, I stung myself three times more, also on the wrist. The attack of erysipelas this time was not nearly so severe; but, as before, I felt a stinging sensation as far up as my shoulder, and I noticed that a lymphatic gland behind my ear had increased considerably in size, the poison being taken up by the lymphatic system. On Saturday (October 10th) I again treated myself to three stings, and the pain was considerably less, though the swelling was still extensive. At the end of the next week (October 17th) I had had eighteen stings; then I stung myself seven

times more during the next week, and I reached the number of thirty-two on October 31st; the course of the experiment having lasted nearly four weeks. After the twentieth sting there was very little swelling or pain, only a slight itching sensation, with a small amount of inflammation in the immediate neighborhood of the part stung, which did not spread further: and I stung myself on November 8th, without its having any effect on me."

THE PROFITS OF HONEY BEES.

During the last fifteen years three or four bee magazines have come into existence, and it is to their interest to have a great many bee keepers in the United States, consequently they often speak of correspondents who write the "naked facts" in regard to profits rather roughly, saying that they are "old fogies, opposed to progress in bee keeping," or something akin to these expressions. I have done something toward exposing the humbugs about bees that we read in the papers, and I propose to "fight it out on that line" for a long time. Notwithstanding that the Bee-Keepers' Magazine of New York is quick to publish humbugs in regard to the *imaginary* profits of bee keeping and has denounced writers who state *facts*, yet I see in the October number of that paper the following admissions from correspondents who occupy a semi-editorial position. One says in reply to inquiries from a person who says he knows nothing about bee keeping:

"If you wish to keep bees for pleasure only, all well; but if for a supply of honey for your family, you can buy it cheaper than you can produce it."

Another correspondent says in regard to the great losses in wintering bees:

"Large numbers die in winter, so that in the spring the bee keeper finds that he has almost to begin anew."

The above quotations merely go to show that what I have heretofore said on the over-estimating of the profits of bee keeping is true.

Linden, N. J. T. B. MINER.

Dairy Husbandry.

DAIRY BOARDS OF TRADE AND THE MARKETING OF DAIRY PRODUCTS.

At the recent session of the National Agricultural Congress at the Centennial Grounds, Philadelphia, Mr. X. A. WILLARD referred to markets and marketing in his address on "American Dairying," of which the following is an abstract:

One great feature belonging to the dairy and which gives dairymen an immense advantage over other farmers is an organized system of marketing. The system was commenced at Little Falls, N. Y., in 1860-'61—buyers and sellers meeting on certain days of the week in the open street to make transactions (for the business was then done in the open air by the side of the wagons). An attempt has recently been made by certain parties to falsify the truth of history by representing that the first effort to establish "sales days" or a country cheese market was made at Utica, N. Y., in 1870.

There is scarcely a dairyman in the State of New York but is familiar with the fact that Little Falls had a regular weekly dairy market or "sales days" *ten years* prior to 1871 and one where millions of pounds of cheese were sold annually. What, then, must we think of those who claim that the first regular "sales day" of the country occurred at Utica in 1871.

On some market days at Little Falls previous to 1864 several hundred farmers have been in the streets near the railway depot, each with his wagon loaded with cheese, boxed and marked with his name, while some twenty or more buyers were scattered among them and passing from wagon to wagon—some from New York, Boston, Philadelphia, Baltimore and other cities, with an occasional shipper from England—could be seen examining, boring, tasting, smelling and making bids for the load.

In 1864 the first weekly report of the Little Falls Market, then and now the largest interior dairy market in the world, began to be made, and since 1868 the RURAL NEW-YORKER has made a specialty in reporting that market.

Previous to 1864 farmers relied on city quotations, which were sometimes thought to be in merchants' favor. But it was not until the early part of 1871 that a "Dairy Board of Trade" was organized, though the project was agitated in Little Falls in 1869 and earlier. Here, as in the origin of the dairy movement as a specialty, Herkimer County took the initiative, establishing a "Dairymen's Board of Trade" under the name of the "New York State Dairymen's Association and Board of Trade."

Soon after publishing and sending out circulars giving the plan of organization and the rules and machinery by which it was to be governed, the dairymen of Oneida County took copy and also established a "Dairymen's Board of Trade" at Utica. The plan spread to other sections, and now many dairy centers in New York and other States have their Dairy Boards of Trade, at which merchants and sellers meet on regular days of the week for the transaction of business in dairy goods. The telegraph is here brought into requisition and sellers go upon the market knowing something of the demand and the price on both sides of the Atlantic. At the interior markets competition often runs high and merchants sometimes complain that margins are narrow and money not so easily made as when the goods were bought at the factory on city quotations. Be this as it may, the dairymen now have a sort of commercial education. They study the markets, both home and foreign, and they judge when it is best to realize on their goods.

SHRINKAGE IN VALUES—THE OUTLOOK.

The shrinkage in values on nearly all kinds of property during 1876 has been very considerable. Real estate has depreciated from 25 to 30 per cent., and in some localities even more. The fall in cotton goods and in some other manufactures has been very great. The value of nearly all our agricultural products is below the range of 1874, and it is not surprising, under the pressure of the times, that dairy goods should have been comparatively low. But even under the darkest phase of the situation the outlook of dairying is by no means discouraging. Indeed, there is no class of farmers better off to-day than the dairymen. They have sold their goods from month to month and from week to week for cash, and their goods have found a ready market and gone into consumption, while other products have been slow of sale even at greatly reduced rates.

The European demand has been fully equal to our surplus and exports keep values upon a gold basis. It is true prices have been comparatively low, but not nearly so low as they were years ago, when dairymen found it not difficult to amass fortunes in the business.

The one hopeful sign for our increased production is that English production is decreasing, while the increase of population in our cities and towns calls more and more for additional supplies of fresh milk and an increased quantity of butter and cheese for home consumption.

That we are not overproducing is proved by the free disposal of the entire products of the dairy from year to year. Very likely if the make was less prices would advance, but the values realized on account of scarcity would press heavily upon the masses, who for the most part find it hard "to make the ends meet" from year to year. Is it not better that the people have cheap food with moderate gains to the producer than that they should suffer for want of food or be compelled to buy sparingly at high prices that the producer may grow suddenly rich? Many dairymen of late years have neglected the economics of dairying, and it is the waste and extravagance that pinches harder than the low prices.

He who can cut off waste and be content with moderate gains will see a silver lining to the cloud (if indeed there be a cloud) that dims the future in the far distant dairy horizon.

PROFIT IN CHEAP COWS.

My last venture in cheap cows has convinced me that while there may be larger profit in the better class of cows, the cheap cow, under certain circumstances, is very profitable. If careful housekeepers could appreciate this fact, more cows would be kept among the so-called "medium classes." Last fall I was compelled to buy a cow to supply our table with milk, and not wishing to put more capital in stock than was necessary, I purchased what was called a poor cow, and was heartily laughed at by all hands. She cost me $35. Her milk was too poor for butter, but I expected to fatten her in spring, and wanted her for temporary purposes only. The circumstances which compelled me to buy also forced me to keep her into summer. I have had her just a year. I have kept an accurate account with her, and as she was kept and fed by herself in a yard, I know precisely what return I have had for my outlay. We have on several occasions made creditable butter from her cream. She is a heavy feeder and always had as much as she would eat to keep her in good condition, for I think that by this means much is saved in time, as well as expense, in afterward fattening. Here is the account:

Cost to Keep for One Year.

Corn fodder	$25 00
Meal (corn, oat and bean)	23 00
Pasture	21 00
Total	$72 00

Produced.

Five qts. milk daily one year (1,825 qts.), at 7c. per quart	$127 75
Butter	6 00
Manure	8 00
Total produce	$140 75
Deduct cost	72 00
Net profit	$68 75

This certainly is a good percentage on the investment. But this is not all. I have credited her with but five quarts of milk daily. This is only what I should have to buy to supply the table, and therefore the only credit she should have, unless the extra milk was sold or used. We consumed it all. Her yield (being farrow) has averaged over eight quarts for the entire year. These three extra quarts, made into pies, puddings, custards, cheese, etc., will make 1,095 quarts, which, at 7c. (it is generally 8c. here), amounts to $76 65, which, added to the $68.75 profit above, will give a grand total of $145.40 as the profit realized in one year from my $35 cow. This, of course, is when all the milk is used to advantage, but does it not prove that cheap cows are profitable? The value I have put on the manure is what I have been offered for it. M. O.

DAIRY DISPLAY AT THE CENTENNIAL.

STRENUOUS efforts are being made by the "Centennial Dairy Ring" to have a display of butter and cheese at the model "Butter and Cheese Factory," "Scale Works" and "Restaurant" on the Centennial Grounds, Philadelphia. In Herkimer County cheese from the factories is being purchased by the managers or their agents, as the factories refuse to exhibit cheese on their own account. As the display of cheese and butter at the Centennial has so far been a failure, we hope the efforts now being made for the OCTOBER DISPLAY will prove a success.

We do not know whether the State appropriation can be used to purchase cheese for the display or not. Probably it would be no worse to use it in this way than to use it and the dairymen's subscriptions in turning the "model factory" into a restaurant.

NATIONAL BUTTER AND EGG ASSOCIATION.

THE above-named Association will hold a meeting in the Produce Exchange, Philadelphia, on Oct. 17. A handsome gold medal will be awarded by the Association for the best butter, the package to be not less than 50 pounds and exhibited on the 17th of October; such butter to be made in the United States. The winner of this medal will be required to make a statement to the Association as to the cows from which the butter was made, the care and feed, process of making the butter, and such other information in regard to the matter as may be of interest to butter makers.

As this Association is largely represented by the commercial interest of the country, we have no doubt the meeting will be well attended and be of value to both producer and merchant.

AMERICAN DAIRYMEN'S ASSOCIATION.

THE adjourned meeting of the American Dairymen's Association comes off at the Butter and Cheese Building on the Centennial Grounds, Philadelphia, beginning Oct. 17, at 2 o'clock P. M. Prof. L. WETHERELL is advertised to give an address on "Dairy Stock;" J. P. SHELDON of England on the "History of Dairying in Britain; Dr. E. L. STUNTEVANT on the "Philosophy of Dairying; J. H. REALL on "Commerce in Dairy Products;" Prof. E. W. STEWART on the "Cow as a Food Producer;" Hon. THOS. BALLANTINE of Canada on "Canadian Dairying;" Prof. CALDWELL of Cornell and Prof. HORSFORD of Cambridge also give addresses.

The Poultry Yard.

FALL WORK IN THE POULTRY YARD.

At this season of the year, between sowing rye and corn husking or topping turnips, the farmer is not quite so much driven with work as he has been since early spring. Now is the time to pay some attention to his poultry. This is just the time Minks, Weasels, Skunks and other *fowl fanciers* approach nearer buildings, looking out either for good, warm winter quarters or something nice to eat. See that your half grown chickens leave their old dirty coops or corners, where they huddle together at night to keep warm—sometimes near an old rat's hole or corners, where they fall an easy prey to enemies.

If any of the coops used during summer are lying about, gather them up, clean well and put them in a dry place, as they are harmed more in lying about after use than they are when in use. At this season where hens have plenty of room, they are more likely to steal their nests than in summer. I suppose the reason is this: That, after having had the sitting fever broken up by their owners during summer, they begin to lay another brood of eggs and, remembering being disturbed, seek for a hiding place for their next nest.

A farmer can now see the result of the year's increase—whether he has succeeded in raising as many and as good chickens as he expected; if not, try to find the reason. Have you been breeding in-and-in, year after year, with the same birds without change of blood? If so, you should kill off your old cocks; procure young cockerels of some good breed to cross with your hens. A few dollars so invested will sometimes double the value of all your young poultry the next year—in some cases, increase the value to many times the outlay on the cockerels.

The winter quarters must also now receive attention, and as the fowls leave the trees and exposed roosts, see that they do not go into a dirty house. Clean up thoroughly; let the whitewash brush be assisted by a willing hand and a sharp eye. See that you have no tyrants that get up to roost first and keep up a constant quarrel with all the other birds as they come in; quiet such an one in the pot. Also watch and see that no diseased ones get in the house with the rest or they may infect the others. H. HALES.

AFFECTIONS OF FOWLS.

THE maternal affection of some hens is truly remarkable. While some will get rid of their chickens as soon as they commence laying again, others stick to their chicks and run after them, even after the latter have become so big that they are ashamed to be seen hiding under their mother's feathers.

A singular case of affection has just come under my notice. The hen that had her second brood presided over by her *dutiful son* (of her first brood) has appeared again in the vicinity where she left them and actually taken charge of them again. She has now laid out her third litter of eggs and taken a short recess, passing away her time in trying to make live chicks out of glass eggs; not succeeding, she got disgusted and came and found her last brood of chicks, which were now forsaken by their big step-brother, (see RURAL of August 19,) keeping company with them again. I once had a hen that kept with her chickens all winter. Dorkings possess this quality more than any other breed. H. H.

N. J. STATE AGRICULTURAL FAIR.

THE popularity of this Fair increases every year; the Stock and Poultry Departments are the growing branches. There is no doubt that one reason of its success is the promptness with which all its premiums are paid. The greatly increased display of fowls this year showed a marked improvement in quality as well as quantity of the birds raised in the State; most of them were bred here. The tent which contains this part of the Fair, though only introduced a few years ago, was this year over-crowded. The Society should now construct a suitable building for exhibiting poultry, for if a cold rain storm occurs during the Fair, the birds are very apt to take cold in a tent. A proper building and a liberal Premium List will still further increase the display. H. H.

The Swine-Herd.

AMERICAN BERKSHIRE ASSOCIATION.

WE are in receipt of the following circular to which we cordially invite the attention of those interested in the breeding of pure Berkshire Swine:

The object of the American Berkshire Association is to revise, preserve and publish the pedigrees of pure-bred Berkshire Swine; also to collect and disseminate information calculated to advance the interests of Swine breeders generally.

In furtherance of a part of its work, and in view of the favor with which the Premium Essay on the Origin, Breeding and Management of Berkshires was received, the Association has decided to offer another Premium of $100 for the best approved Essay on the Diseases of Swine, their Causes, Preventives and Remedies. Said Essay to be practical and exhaustive. The competing Essays to be forwarded to this office on or before the 1st of January, 1877. The award will be made and the money paid at the annual meeting in February following. All competing Essays will be the property of the Association.

Competition is invited from all practical men who have given attention to the diseases to which Swine are subject. Prof. Law of Cornell University, N. Y.; Prof. Smith of Toronto Veterinary College, Canada; Hon. T. C. Jones of the "National Live Stock Journal," and E. G. Bedford, Esq. of Kentucky, have kindly consented to act as the Awarding Committee.

The Premium Essay will appear in Vol. II. of the American Berkshire Record now in course of preparation, the pedigrees for which, as fast as approved and certified, have Record numbers assigned them, and certificates of registry forwarded to parties entitled to the same, in advance of publication in Vol. II. Address, Secretary American Berkshire Association, Springfield, Illinois.

The Centennial.

WESTMINSTER HOTEL,
PHILADELPHIA, Oct. 12, 1876.

THE Exhibition of Sheep and Hogs now open in connection with the Centennial Show, contains within its numbers some very valuable animals. Among the imported flocks the one sent over by Lord Walsingham, from the Merton Flock, is of superior excellence. One Ram of the lot is named Dew Turf; he is two years off, and took several first prizes all over England during this present season of 1876. This flock is of South Downs, of the pure Webb blood.

H. Overman of Filford, England, exhibits a splendid collection of Cotswold Sheep, and close to them stand several head of very excellent Oxford Downs. These latter are heavier, and so to speak, coarser than the South Downs; both are fine-wooled. The best Cotswold to my judgment are those shown by B. Swonwick of Cirencester, England. The pelt and fleece of one recently slaughtered, weighed 21⅓ lbs., and the wool measured 10 inches long.

The various flocks of Merino Sheep represent nothing of superior quality save one Ram full of quaint, uncouth wrinkles, and black grease, with a ridgy, curling pair of Horns, altogether possessing a most picturesque appearance. These eminently fine-wooled Sheep have always been largely bred in Vermont, but recently the Empire State contends with her sister of the Green Mountains for pre-eminence in the breeding of Merinos.

The great markets for these pure bred flocks are the Southern States, notably the State of Texas, where the climate seems to be peculiarly adapted to the growing of fine wools. There are also some very fine Shropshire Downs, bred in America from imported stock: these Sheep shear to 16 lbs. weight, are heavier than the South Downs also longer and not so fine.

L. C. Fish of Otego, Otsego County, N. Y., has a flock of choice quality imported Oxford Downs. These are very comely and thriving in aspect with fleeces similar to those of the Shropshire Downs. The official catalogue in all numbers 402 head, and comprises long-wooled varieties as well as those fine-wooled of which we have spoken.

At this present moment the sheep owner of America has to look to his growth of wool for remuneration, rather than to the value of his flocks as meat producers. Still the day is not so far distant as some may imagine when America must look for food from her flocks as well as from her herds. Under this view of the matter, it is well for sheep fanciers to keep before them these facts: Are they to simply grow wool, or are they to improve their flocks as mutton sheep? I would recommend both. Thus, for instance, a pure-bred Merino is valueless as mutton, but the very best fine-wooled variety known. The South Downs are choice mutton, and likewise of great value as a medium-wooled sheep. The Cotswolds are the very best wavy-fleeced sheep we possess; they are good in mutton, but not equal to the South Downs. The Lincolns and Leicesters stand side by side as long-wooled sheep. Their fleeces have been grown to 14 inches long; 11 inches is quite a usual growth.

But of these various tribes of the peccarine family breeders can select, but to do so judiciously, flock owners must suit their flocks to the climates into which they take them. Differences of heat and cold, quality of water and variety of pastures, tell seriously on the mutton and wool. Then, again, a judicious cross often gives a most fortunate result for wool growers. This fact is established by the quotations of the English wool markets, where the medium wool of New South Wales, grown on the cross of the Cotswolds and Merinos, bears the highest price. These fleeces measure about four inches long, and shear heavy in proportion to their length. This wool, when woven, has a luster peculiar to itself, and may to-day be regarded as the best on the market. When looking over the cases of wools in the Main Hall, I observed that Messrs. Shannahan & Jennings of Warbreccon, New South Wales, did not please the Judges by their exhibition of wool. This firm received no prize. Their being passed over may safely be regarded as a mark of distinction with which they may well be content. Our excellent contemporary, the New York Times, recently jested on this prize-giving, and said that where everyone got an award those passed over were the most complimented, if for no other reason than by being in the minority.

Of the mutton varieties of the sheep, there are the Black-faced sheep of Scotland, a hardy mountain race, yet little known in America, also the flocks of the Cheviot Hills; and in Ireland the Kingdom of Kerry has a breed of small sheep, unsurpassed for juiciness and delicacy of flavor.

That one or all of the States of the Union could produce equally valuable wools and equally excellent mutton is not to be looked for, and therefore the sheep breeder, for his own financial benefit, must study the requirements for superior quality in mutton as an investment and for wool growing as another. A warm climate and a dry atmosphere will less injure the fine-wooled sheep than the long-wooled families. This can be seen by the climate of India, where the peccarine family assume the goat form. Heat produces hair rather than wool. Cold, dry air, with short, sweet, mountain pasture, gives the best mutton, as I go on the footing that prize South Downs, salable at from $500 to $1,000 per head, would be only fit to serve in chops as an after course to Cleopatra's soup, in which pearls were dissolved.

A sheep run, to be what it ought to be, should possess a southern aspect and be on sloping ground naturally under-drained. It should also be sheltered from cutting winds and of such a depth of soil as to allow a sure hold for hurdles. The free range of flocks must, even in America, come to an end. Running wild is bad for beasts as well as for men and children.

Although the given number of the entries of hogs is 212 still the actual arrivals represent a greater number. In these herds there are several good specimens. Walter Cole of Clinton, N. J., exhibits a boar 13 months old. He is of the small Yorkshire variety, is white, and is altogether a charming pig, having ham and fried bacon in view. Some of the Chester whites are very good, being long in the back, well filled up and short on the leg. T. S. Cooper exhibits a herd of about fifty. They are ruled over by as beautiful a boar and sow as any one could desire to own. The boar has been but recently imported. He took first prize at the Royal last July, when the Exhibition was held at Birmingham, Eng. These black Berkshires are very thrifty and are sprung from the old-fashioned black-and-tan natives of the same county in England.

On the whole the sheep and hogs at the Centennial Exhibition make a most creditable show, both as regards number and quality, and speak well for the enterprise of the breeders and exhibitors.

M. M.

CENTURY BLOSSOMS.

THE WHEELER & MELLICK CO., Albany, N. Y., make one of the most interesting and progressive displays of agricultural implements at the Centennial. They have had their share of medals and honors, which is as it should be, in view of the fact that this company is a pioneer in the business, having sent, since their establishment in 1830, implements to all parts of the world. In our issue of Aug. 5, we give a detailed account of the work done by the Threshers and Horse Powers of this firm. They made a record that should be, and doubtless is, most gratifying. The house has been further honored, by the fact that the Commissioners of the Japanese Government have bought the entire exhibit in Agricultural Hall, to be shipped to Japan.

THE old-established firm of WM. L. BOYER & BRO, Philadelphia, Pa., have been abundantly rewarded at the Centennial, having taken, as their advertisement fully explains, three Grand Medals. The Premium Farm Grist Mill has long been a favorite, on account of the excellence of its work and its durability, the grinding parts being made of steel instead of cast-iron. The Union Railway Horse Power is too well and favorably known to need more than a mention. It is most appropriate that the award for Broom machinery should come last, thus making a *clean* sweep, and conferring on the house honors enough to last at least another century.

THE floating ball business exhibits in another instance—that of the Westinghouse air brake—an illustration of the law that gave to our earth its form of a spheriod. A fine jet of air keeps up a rubber ball in mid-air and holds it up, even when the jet is turned obliquely, driving off the ball to an angle of 45 degrees. The swift rotation of the hollow ball gradually changes it from a true sphere to a spheriod—the poles, or extremities of the axis of rotation, flattening, as those of the earth flattened, ere yet our whirling planet had attained its solid form.

THE huge boat, from the Alaska Indians, shown in the Government Building, is interesting. Sixty feet long, and very deep, this Leviathan of a rowboat was actually cut or burned out of one single vast log; apparently a tree of the mammoth California redwood kind; at any rate, one of the Coniferæ—though who ever supposed such giant trees grew away up in Alaska. It had to be sawed in two before it could be got into this Exhibition.

As we go to Press we hear the mutterings of discontent mingled with the cries of exultation over the Centennial Award Reports. Some are happy and others are savage.

COOK, of tourist fame, has on view in his pavillion a mummy of an Egyptian Princess some Centuries old. The mummy is somewhat tanned!

Industrial Topics.

PATENTS AND PATENT AGENTS.

OF late years there has been manifested, conspicuously in England and only a trifle less noticeably in several continental countries, a growing agitation for the entire abolition of the oppressive monopolies inseparable from the present patent system.

The prime cause for the existence of this system is to reward inventors for their toils and talents with the profits from a temporary monopoly of their special devices, as a stimulant to further improvements in the arts for the benefit and convenience of the public. Experience, however, has amply demonstrated that in all, but a few exceptional cases, the system, while fostering a host of spurious pretentions, and iniquitous extortions, has fallen lamentably short of the remunerative design, the fulfilment of which could alone justify its existence. Rarely, indeed, does a tithe of the vast profits arising from patents find its precarious way into the pockets of the deserving inventor, while the exorbitant residue is greedily absorbed by capitalists and agents who have given to the public no equivalent for the exactions they pitilessly levy upon it. A moiety of the ingenuity wasted on many an abortive patent could readily devise some effectual scheme for accomplishing the object missed by our present system, while avoiding the frauds which the latter has notoriously promoted. Of these the two most mischievous sources are delusory patents and fraudulent agents.

The issue of a patent is an absolute guarantee neither of the worth nor originality of the device it covers, nor of its immunity from compulsory royalty to prior patents possibly infringed upon in the contrivance in which it is embodied. Frequent decisions of the U. S. Supreme Court have demonstrated the innocent gullibility of the wiseacres of the Patent Office on the first and second of these points, while a flagrant obtrusion of the third is no bar to the issue of a subsidiary patent. When a patent, however, has passed unshaken the crucial test of this judicial arbitriment, its value is vastly enhanced by the certainty of its validity. It is then only that a farmer should think seriously of investing his hard-earned gains in territorial rights under it, and after mature deliberation, firmly decide in the negative.

A farm is paradoxically the jealous master of its owner, and stubbornly insists, under penalty of his certain demoralization and ruin, on his exclusive labor and attention. By distracting his mind and means from his legitimate pursuits the free gift of a patent-right would generally prove as disastrous to him as that of a white elephant to a Siamese political offender.

For mischief, however, the superfluous patent far outstrips its untenable rival. The latter is often sought in innocent ignorance of its invalidity, and not unfrequently drops unoffensively into the crowded limbo of still-born patents. Its noxious congener, on the other hand, is commonly obtained with the determinate purpose, on the part of its speculative owner, of realizing from it a competency or fortune through the simplicity and credulity of its purchasers.

Some bright inventive genius devises, adapts, or blunders upon "tweedle," patents it, and makes a hit; another improves it by adding "dum," while a third ornaments it by affixing "dee," and straitway a multitude of superfluous patents deluge the country, covering every imaginable variation of the adjuncts of the popular "tweedle" to which they all owe a royalty, as it necessarily enters into their construction. Of all these, imposition not improvement is the direct design; and their sole originality is strictly limited to their sublime impudence.

This also is a pre-eminent characteristic of the gentry who handle them. An important patent is frequently controlled by a man of unimpeachable honor, capacity and truth; but when eagles adopt the habits of vultures, then only will such a man peddle patents through the country. These deal chiefly with manufacturers whose keen competition makes each house eager for some exclusive advantage over its rivals. A patent for a valuable invention or improvement, therefore, is sure to find among them a ready, though cautious, purchaser. Experience has taught them that a large proportion of patented devices are either impudent shams, crude abortions, or cunning infringements on prior patents. In dealing with an inventor these personages haggle as penuriously as if every dollar paid for his patent must lessen their own hoarded accumulations; but in fixing the price of the goods covered by it, the measure of the public need of them is the only limit to their grasping cupidity. The mild objections of the storekeeper, or middleman, they blandly silence by the cheerful reminder that the consumer must be the ultimate sufferer, and that his own profits must increase in proportion to the price of his wares.

Ordinary patent agents are largely recruited from the ranks of book, and notion peddlers—men who take to the trade, not from choice but necessity, because their vagrant habits unfit them for steadier pursuits, and also because references as to character are, as a rule, charitably dispensed with in those avocations. The difference of their methods naturally classify these under two heads: glib sputters who retail territorial rights, and prying extortioners who zigzag through the country, exacting under the specious title of royalty, an arbitary tax on goods already honestly paid for. Never surely has Royalty been so abjectly degraded as when subjected to the controll of these tricksters.

Among the former class congenially mingle a liberal sprinkling of arrant swindlers some of whom deal in forged patents, while others confine their operations to genuine patents for which their own character as agents alone is counterfeit. Marvelous is the fluency of this whole tribe on the exceptional merits of their several devices. To every possible objection the most plausible answer has been carefully formulated beforehand, so that a reply to every exception drops from the lips of the agent as spontaneously as an agreement "to liquor." Their volubility, however, runs strictly in the line of laudation, and not a hint is ever accidently dropped on the cognate patents on which their own generally infringe. The plausibility of some of these has filched from the public and possibly from their principals, considerable wealth, so that they could well afford to purchase the patents they huff so vigorously if their conviction of their worth coinceded with their praises. So hazardous a risk, however, is seldom run, and the exceptional speculator, until he has unloaded, is as restless as a timorous merchant overstocked with perishable goods on a falling market. Their own participation in the work of ruin wrought by such rashness is too extensive to allow themselves to sleep peacefully while exposed to its chances.

In pursuit of the common design of enriching themselves by fleecing the public, the method of these is far less surreptitious unmanly and dishonorable than that of their prying brethren. These owe the possibility of their existence directly to an unjust provision of the patent laws. One of these sage embodiments of legislative sagacity prohibits the manufacture, sale, or use of a patented article without the consent of the patentee. Both the manufacture and sale of such an article commonly occur in known violation of this enactment. The user of the device, however, seldom remembers the law, and still more rarely has the remotest knowledge of the patent. Under these circumstances the only honorable course open to agents and their principals would be to restrict their claims to the manufacturers and salesmen who have consciously wronged them.

These they could readily discover, force to a legal account of the articles they had illegitimately disposed of, and collect the combined royalty at a minimum expense. Through fear of a suit, however, either on account of the known invalidity of their pretentions, or the limits the court might prescribe to their exactions, they deliberately refrain from pestering the bold infringers of their rights, who would be likely enough to combine for mutual protection, and dishonorably press their arbitrary extortion on the scattered innocents, who foolishly imagine themselves legally entitled to use what they have honestly paid for.

Farmers are the favorite prey of these sharpers, who base their best hopes of success on rustic ignorance of the merits of their pretentious, and rustic dread of the marvelous expense and uncertainty of the law, and the still more marvelous vagaries of its administrators. Intimidation is their darling recipe for the collection of their impositions—pity they cannot be occasionally nauseated with their own prescription! A vigorous public opinion is the most efficient exterminator of these pests. Their aims and methods forfeit all claim to courtesy or toleration, and a lively outburst of indignation is the fittest mood to receive them in. Bogus agents are plentiful among them, but, apart from verified credentials, it needs an acute perception of differences to discriminate the counterfeit here from the genuine. Many patentees, not only allow, but encourage the free sale of their monopolized devices with the premeditated purpose of afterwards wringing, by arbitrary extortion from unsuspicious users, a far more exorbitant price than could be realized by the legitimate sale of their patents. A combined resistence should be offered in every neighborhood to the exactions of these vagabonds. And before the institution of a suit satisfactory security for costs should be rigorously insisted upon.

It is due mainly to the practices of fellows of this stripe that the ordinary conception of a patent agent fluctuates between that of a charlatan and a swindler. In warning the public against their machinations it has been an unpleasant duty to reflect on the whole of this energetic class as more than a trifle disreputable. It is pleasant therefore, to be able to say candidly that there are among the sputter tribe a few exceptions, just about enough to strongly confirm the rule.

KEME.

The Vineyard.

WINE MAKING.

In my article on this head, I promised some quotations from the writings of some of the most eminent vintners and grape and vine growers in the United States. The antagonistic opinions expressed by them as to the propriety and even morality of adding to the juice of the grape—to supply any natural defect of the variety, or its accidental defect from lack of ripeness—any foreign matter like sugar, water or acid, throws us who would look for information, back upon the resources of our own judgments and compels us to learn by the more slow but more sure process of experience.

C. M. GRANT, the originator of the Iona and Isabella grapes and the publisher of "A Manual of the Vine," says:—"Wine is but the juice of the grape changed by fermentation and does not admit of any other change or any addition without destruction of its character. The evil of the adulteration is not lessened by being made in the form of sugar added to the juice before fermentation." P. B. MEAD, author of a work entitled "American Grape Culture and Wine Making," says "Wine is the fermented juice of the grape, nothing more and nothing less." He condemns the addition of sugar even in bad seasons, when the grapes lack their usual supply, and says, "This need not be so, and even if it were, it is better that a few men should suffer temporary loss than that many should lose their manhood and even their souls;" speaks of the demoralizing effect of adding anything to the must, and claims that the wine to which cane sugar has been added makes men drunk, "while the other does not." Other men of less note claim that no beverage is worthy the name of wine that has been *adulterated* with cane sugar.

On the other hand, Mr. LONGWORTH of grape and vine notoriety, says:—"In all wine countries (unless it be where light, hard wines are made) sugar is added or its equivalent. From experience I am perfectly satisfied that it is immaterial whether the saccharine principle be in the grape or added to the must in the form of sugar." G. HUSSMAN says on this subject:—"If nature furnishes me in the grapes a juice which contains everything to make first-class wine I shall leave it so, on the principle of let well enough alone; but if I think there are deficiencies which can be supplied by adding to that which is already in the must I shall do so, as my reason was given me by an all-wise Creator for the purpose of using it to the best advantage."

I could quote from many more writers, especially on the affirmative side of the question, of using cane sugar or sugar and water to supply any defect, or to reduce any excess either of sugar or acid; but I deem this sufficient to show that doctors disagree in this as well as in the diagnosis and treatment of disease, and that the person to decide in either case is the patient. I do not write for the purpose of instruction or advice to the professional wine maker, who is supposed to know the tastes and the wants of his customers and to have instruments to test the proportions of the desired ingredients, but rather for the benefit of those who are compelled to raise only such grapes as are suited to their climate, and who wish to make wine for their own use and to suit their own palates. As to the morality of wine drinking I have nothing to say, except that I look upon drunkenness as a sin. That which in wine produces it is alcohol, and whether this is produced from cane sugar or from the natural sugar of the grape, I can see no difference. Alcohol is the natural product of fermentation of diluted sugar and according to the best chemical authorities cane sugar changes to grape or fruit sugar, as the first move in fermentation. The chemical difference in the two sugars is that grape sugar contains a trifle more of the elements of water than cane.

As to the statement of MEAD, that wine made exclusively from the pure juice of the grape does not intoxicate, we learn on the authority of the Bible that men in those times got at least tipsy on wine, and as neither sugar or alcohol are mentioned in that book, the natural presumption is they and the art of extracting them were then unknown, and whoever got drunk then must have got drunk on pure wine *unadulterated* with cane sugar. I believe in alcohol—not as King, but as a useful compound designed by our Maker for the use of man. It is only the distiller or the chemist who separates it in a liquid form from the nutritious ingredients in which nature forms it. Sugar is formed as the ripening process of vegetation. Fruits, grains, vegetables and plants, when arrived at perfection, contain either it or its elements. Alcohol contains exclusively the same elements (carbon, hydrogen and oxygen) but in different proportions, and is produced by the fermentative decay of vegetable substances. In the ordinary process of making bread it is formed, but escapes into the air as vaper; the distiller produces it by a similar process, but prevents its escape by condensing the vapor to a liquid, and here lies the great evil of intoxication with its long train of woes.

Men may and do get drunk on wine, cider, ale and other fermented drinks all containing a percentage of alcohol, but seldom till after they have been made drunk by alcohol less diluted. These drinks contain also nutritious matter in combination and do not, except in immoderate quantities, produce that disorganization of the stomach and muddle of the brain that alcohol, even if diluted with water, does. Fats, oils, sugar, starch and other carbonaceous foods, contribute solely to the formation of animal heat, and physiologists tell us that whatever of these substances is not wanted for immediate use is stored up in the body in the form of fat for use in an emergency, so that the fire within shall not go out. Alcohol also furnishes heat, but they tell us it does not form fat and is never stored up, but that it and water pass directly into the circulation without digestion.

Muskegon, Mich. S. B. PECK.

PRICES OF GRAPES IN CALIFORNIA.

VINEYARDISTS in the Eastern States who complain at the low price of grapes when they do not command above five cents a pound, should read the following from the Napa Register and be comforted:

At the meeting of the State Vinicultural Society, Sept. 2d, some statements were made respecting the price of grapes and some reports of sales were made. At St. Helena, a sale of foreign grapes (Thomann's) had been effected at $20 a ton. Some foreign grapes about Oakville had been sold as low as $18 a ton. A sale was reported in Napa, of Mission grapes and others as they run, at $13, but these figures, we are informed, are not to be considered as a criterion, because the grapes were General Miller's, who is not supposed to be so dependent upon his vineyard as most of the grape growers, and is consequently less particular about the price. The purchaser was Migliavicca. It was stated that Groezinger would do little buying; but has already engaged 160 tons at Oakville; no price named. In Sonoma there was very little purchasing—the prevailing price being $15 "all around," Mission and other varieties included.

Field Crops.

MORE ABOUT COMFREY.

THE talk about comfrey as a forage plant is still brisk in England, pamphlets being issued extolling its properties and value as a farm crop. One is noticed in the last number of the Agricultural Gazette, Kinerd B. Edwards, in which the author takes strong grounds in favor of the old plant. We are told that prickly comfrey will yield as much as 20 tons the first year, 50 tons the second, and 80 to 100 tons every year after; the author of this magnificent promise having himself cut, "during the last four years, from 80 to 100 tons to the acre." He adds that all the animals of the farm, including rabbits, are fond of this new forage plant, and that it comes from the Caucasus, and has been some years established in Ireland, and in some parts of England.

Wishing for more definite information as to the merits of prickly comfrey, we called on Mr. K. B. Edwards, in Leicestershire, and found him a grower of several rods of the plant in a dozen patches in his garden, and on waste spots about the premises. No practical farmer need be warned against expecting 80 or 100 tons per acre. If the plant yields half that amount of forage it will still yield twice as much as any other plant with which we are acquainted. In confirmation of what we said lately in the RURAL NEW YORKER, about the common comfrey being the same or closely allied to the Prickly, we find that the editor of the Gardeners' Chronicle, who is well known as an able botanist, says that he finds little difference between them.

The two are, however, so close botanically, that it is probable that as forage plants their value would be equal. For the same reason it is to be feared they are both alike plants with a special habitat. How does the new forage plant behave on dry soils? Let us hope that we shall soon learn more about it; meanwhile, hairy and bristly as the comfrey is, it does not appear to be unpalatable. Some cows and horses in Mr. Edward's paddock ate some of the leaves which we gathered for them, and seemed to approve of them, and the gardener assured us that they very much prefer the comfrey to cabbages, and will race up the pasture for it when regularly fed on it.

The gardener, William Bennett, is as great an enthusiast on the comfrey question as his master. Sixty yards of comfrey, he says, will feed a store pig to 40s. without corn, and as soon as he has finished the patch there will be a fresh cut of leaves, and so on *ad infinitum* almost, or, say, from early spring to latish autumn. A quarter of an acre, says Bennet, would serve a good big cow all the season, cut and come again, the same as in the former case. A horse would do well with a little more than a quarter of an acre, without corn; or, to put the case in another way, every quarter of an acre of comfrey would, in Bennett's opinion, prove equivalent, in the summering of cows, to 1 acre of good Leicestershire pasture, the forage to be brought to the grass every day on the cut-and-come-again plan. The plant ought not be allowed to run up. The leaves shooting at the stool should be gathered with a sickle.

W. Bennet speaks of a plant which he calls comfrey, which has always been grown in small patches in an adjoining hamlet named Aston Flamwell, where every cottager had a small bit in his garden for ornament. According to our informant this is not an easy plant to "get shut of" when once in the ground. The cottagers or their wives wished to introduce something more modern, and a doctor of the district, driving by one day, found them endeavoring to destroy it. He had often begged some leaves of this plant, which are capital for boiling down as an emollient for cuts and bruises, by virtue of the mucilage they contain. "We want to get shut of this plant," said the cottagers. "You had better get shut of the church," said the doctor. The plant was, therefore, spared in some instances; but the cottagers have not yet learned to feed their pigs on it, though Mr. Edwards, on the hill above, is so strongly recommending it. Their plant, it seems, had a "white" flower.

The common comfrey has flowers of various colors—buff and purple; that grown by Mr. Edwards has purple flowers. It is propagated with great ease. The smallest bit of root will grow if cast out in any damp corner, and covered with mould, or even laid on the surface. Mr. Edwards is propagating the plant with might and main. In a byre upon some bricks—on a hard gravel surface—anywhere in the shade and well-watered, we found it vegetating freely in small bits mixed with mould and manure. Its vitality is prodigious. It can hardly be killed. Every morsel mixed with mould and kept damp by watering twice a-day, is sure to grow in warm weather, or in cold weather with a little bottom heat. Lengths of 3 or 4 inches of the root are recommended, but small pieces without a bud on them, and only a little bit of bark, will soon callus at the edges, like the cutting of a geranium, and rootlets are then emitted, and the result is a plant.

It is to be hoped that comfrey will be tried on a small scale, especially in situations where it grows naturally. It seems a promising plant for cottagers, especially those who have cow plots, and the common sort seems to promise quite as well as the so-called Caucasian variety. Seedsmen and gardeners must always have *aliquid novi*, and if from foreign parts so much the better, and Mr. Edwards will quite deserve his 8*s*. per 100 for the root cuttings if the plant turns out well. But there is no reason why cottagers should not dig their own comfrey and try it; they will probably find it as good as any foreign sort under the sun.

Around the Republic.

IN PRAISE OF OREGON.

DURING the last few months I have noticed in your valuable paper communications from Colorado and other parts of the country with regard to the advantages and disadvantages of each respective locality. Perhaps your generosity will permit me to tell your readers something of the goods and ills of Oregon. I dare say some will hesitate and say, "*Oregon!*—where is it?" If so, it is to them I wish particularly to speak.

Oregon is situated in the northwesterly portion of the United States, and is getting to be of no little note among her sister States as regards commerce and agriculture. Salem, her capital, is situated on the Willamette River, about fifty miles from its mouth, and is also on the line of the Oregon and California Railroad. Portland, the metropolis, is also situated on the Willamette River, near its mouth, where it empties its waters into the Columbia, which wends its way to join the mighty deep, and being the terminus of the O. & C. R. R., as soon as said road is completed it will have direct communication with San Francisco both by water and rail, ocean steamers coming direct to Portland wharves to discharge and take on freight.

Oregon proper is divided into three distinct parts or natural divisions, viz., Southern Oregon, or Rogue River; Western Oregon, or the Willamette Valley, and Eastern Oregon, or Upper Country—a strip of country lying between the Cascade and the Blue ranges of mountains. This vast tract of country is drained by the Deschutes, John Day, Umatilla and Grand Ronde rivers, all of which, after making innumerable windings and curves, traversing deep, rocky canyons and broad valleys, eventually discharge their waters into the Columbia and its tributaries.

As this is the place of my abode, I shall proceed to speak at present with reference particularly to this part of our young and growing State. Situated as we are far above the ocean level and immediately behind the lofty condensers of the Cascade Mountains, we are effectively guarded against the long, rainy winters that so harass the settlers of the "beautiful Willamette," and being further inland, are more exposed to extremes of heat and cold than those nearer the coast, thunder storms, water spouts, etc., being of rare occurrence during the summer months. In short, our climate resembles generally that of Eastern and Central New York, except that we have less rain in summer and our winters are of shorter duration, owing to the peculiar influence of the "Chinook winds," of which I may say more at some future time.

Eastern Oregon is about 150 by 180 miles in extent and is bordered on the west by the Cascade range of mountains, on the north by the Columbia River, and on the east and south by the Blue Mountains, whose broken ridges, extending in every direction, bring relief to the extremely monotonous appearance of the bold bunch-grass hills. To render a graphic description of this so-called "Bunch-grass Country," one must have, 'phrenologically speaking, a fuller development of the "bumps" of individuality, locality and language than your humble servant. I will simply say that it is, first, a high, long ridge called a "divide;" then a long, crooked, deep, narrow valley called a "canyon;" another divide, then another canyon, and so on.

In traveling across the country one occasionally meets a long stretch of table land several miles in extent. Nearing the large streams, and when some 15 or 20 miles therefrom, the traveler suddenly discovers himself lost in sand and sage brush in an apparently barren desert country, where nothing could subsist, but which abounds in coyotes (prairie wolves), jack rabbits and sage hens, and extending to the river bank. All the hills, excepting where massive beds of lava rock hold complete sway, are covered with a very nutritious grass, from which they derive their name, and being too dry for agricultural purposes, they are of immense value for pasture, thousands of horses, cattle and sheep being fattened thereon every year. The narrow valleys between the hills, being constantly enriched by the washings from the hillsides, are very fertile. It is here that we settlers have "stopped" to build up homes and lay up for ourselves and our posterity a share of this world's goods.

Our little town of Heppner, which four years ago consisted of but one little log cabin, is situated on a small stream called Willow Creek, and contains at the present time a good school-house, post-office, two dry goods and grocery stores, one drug store, two blacksmith shops, a hotel, a shoe shop and a saloon, and has a population of nine or ten families, all of whom have erected good, comfortable dwellings. We now get the mail each way three times a week, whereas four years ago we had to go to Umatilla Landing—a distance of 50 miles—for it. On the whole, I think we are about as happy as the majority of those more highly-favored ones who live in the more thickly settled and fashionable parts of the world.

Mr. Editor, I will not too much tax your patience this time, but will, if you should think this worth publishing, bother you some more on a future occasion by telling your readers, in my lame way, something about the manner in which we poor people expect to make a living, together with our habits, customs, etc., in order that they may know in advance what to expect should they ever come to Eastern Oregon. M.

Sheep Husbandry.

NOTES.

Sheep Raising.—This branch of business, like almost every other, has had its ups and downs, but it is a question whether any business has paid better for a series of years. The rapid increase of sheep is very favorable to farmers of small means who wish to engage in wool-growing. Sheep raising is too much neglected in the West. The animal that furnishes clothing, food and light, which eats what other animals reject, which crops hillsides too steep for other creatures to ascend, is entitled to vastly more credit than it receives.—*Chicago Times.*

How to Tell the Age of a Sheep.—A sheep's front teeth the first year are eight in number, appearing all of a size; second year, the two middle ones are shed out and are replaced by two much larger than the others; third year, two very small ones appear—one on either side of the eight; at the end of the fourth year there are six large teeth; fifth year, all the front teeth are large; sixth year, all begin to show wear—not till then.

Floricultural.

POTTING,—EXPERIMENT.

The best way to prevent the annoyances of ground worms, is to place pans of soil in the oven and bake it from day to day until a sufficient quantity has been accumulated for potting purposes. This not only kills ground worms but all eggs, larvae and pupae of insects. In years gone by we have taken much pains to procure leaf-mold, decayed sods, well-decomposed manure, peat and the like, thinking that the benefit to plants from such admixtures compensated for the pains of gathering them. There is no doubt but what some plants thrive better in specific soils—but taking the great majority of them as found in conservatories, windows, sitting-rooms—it is all "Love's labor lost." This one thing above all others should be looked to, viz., so constitute the soil as that the water by drainage, evaporation and the absorption of the roots shall pass away before it has time to generate those acids and gases, resulting from stagnation, which are fatal to the new and delicate fibers of the roots. In nine cases out of ten where there is sufficient sun, sickly plants are caused by the use of stiff soil.

In consequence of this, first, the roots are deprived of air—second, if water enough is given to penetrate the entire mass, it cannot escape fast enough to prevent stagnation—third, if water is given in quantities insufficient to penetrate the entire mass, the lower earth becomes as dry as punk and the poor roots that sniff the surface-water that is to them "so near and yet so far," are worse tantalized than was TANTALUS himself. Finally it is impossible to determine when such a soil is used, whether a plant needs water or not; and if this could be determined, it would be just as impossible to supply the needed quantity. A liberal proportion of sand is all that is required to remove these difficulties. Moss, leaves, grass so entirely dried that they will crumple into bits in the hand, answer likewise a similar purpose.

Many of us err in supposing that a high degree of richness for potting soil is desirable. It is often deemed not only desirable but indispensable. Now a very rich soil is for plants what pork is for men. It may be nutricious and healthful for those which are performing hard work—which may be said of a healthy plant when exposed to brightest sunshine, to the ever-changing air and winds, to the dews of morning and evening and to the natural rainfall of its native habitat. Then the vegetable machine may be said to be "under full blast" and the supply must be proportionate to the expenditure and consequent demand. But let us bear in mind that house-plants cannot be supplied with these conditions and that our first care should be to deprive them of any stimulant which is calculated to force their growth. It is seldom considered that of two plants out of their natural elements, the one that makes the slower growth may be the more healthy.

As tending to show, first, the extent to which certain plants draw their food from air and water; second, the uselessness of rich soil third, the importance of thorough drainage and, fourth, the importance of a permeable soil, we give the following experiment:—Last fall hundreds of our seedling Pelargoniums were left out to perish. Nov. 6 the thermometer sank to 18 degrees above zero. The Pelargoniums were frozen to the ground, though as but the surface was as yet frozen the roots were still alive. We removed two of them, a bronze and a "tricolor" to 6-inch pots, which, after securing perfect drainage, were filled with silver sand, cleanly washed, and flooded with rain-water. In due time they pushed buds, formed leaves and grew so nearly as the others that, but for the sand, they could not be determined from them. The experiment ended the first of June when they were again placed in the ground. They had formed less stem and fewer leaves than those planted in soil. They had not bloomed or formed blooming buds, but were in perfect health and after being placed in the open ground, recovered sooner and grew more vigorously than the others which had received the usual treatment. Thus through a period of nearly seven months, these two Pelargoniums had lived and remained in perfect health upon air and water, the sand merely serving as a medium of support and confinement to the roots, and of permitting a constant change of water without their disturbance. Several times they were lifted out of the sand so that the root-growth might be observed. It was spongy and succulent, though not abundant, and so light that the weight of the adhering sand sufficed to break the fibers asunder.

A Cape Pelargonium, the name of which we never knew, growing in a 3 inch pot, was placed on a cellar shelf and forgotten. There it remained eight months without a particle of water. The stem was found, at the end of that time, to be unharmed, even at the tip, and upon receiving water and sunlight, grew most vigorously. This will show—in the case of Pelargoniums at any rate, though it will be found not to end with them by any means—that some plants which we take for granted can scarcely be made to live through a winter without it, may, if placed in partial darkness, rest in perfect health without water for surprising periods. This may be deemed "resting in its truest sense." The roots were excluded from air and moisture. The stems existed in half darkness and in an atmosphere that could be called neither moist nor dry. The stem had no need of the roots' support—the roots had no need of the support of the stem. There was no labor—no outgo, no income; the plant was at rest.

We may make this inference:—Let us regulate the water and nutriment given to a plant by the porousness of the soil and the amount and intensity of sunshine.

MISCELLANEA.

AMONG our most beautiful ornamental trees, the Horsechestnut, Tulip and Yellow-wood are the first to lose their foliage. The Horsechestnut compensates for this in a measure by being almost the first to leaf out in the spring.

FREMONTIA CALIFORNICA.—Last fall we sent seeds of this shrub to a number of our correspondents. Ours did not germinate. We would be glad to hear from those, if any, who were successful.

EXCHANGE.—We are pleased to see that several of our contemporaries have taken up our plan of exchange. We hope that every horticultural journal in the country will follow suit and that it will enable the poorest families to fill a window with suitable plants during the dull winter and a plot with bright, cheery colors during the summer.

NOTICE.—We have occasional letters asking for seeds or plants and offering pay for them. Sometimes money is inclosed, We do not sell either seeds or plants under any circumstances whatever.

THE "LITTLE ANNOUNCEMENT."—We are surprised, in looking over our first installment of letters applying for seeds, to find that *Zinnia Darwini* is so often mentioned. We do not want our friends disappointed, and so were careful not to praise this plant in our "Little Announcement." Is it that we have so praised unworthy things beyond their merits that our friends seek to find out what sort of a plant it can be that we will not praise at all? Those of our subscribers who want *Z. Darwini* and who will send us an addressed stamped envelope shall have them so long as our stock lasts. *Zinnia Darwini* is *Zinnia Darwini*, and "it is nothing more." He who says there's nothing in a name don't know "beans!"

NOTES.

THE Revue Horticole thinks well of the sweet-scented *Aponogeton distachyon* as a pot plant, grown in a frame and kept moist. It is hardy enough to flourish in the open lake of the Edinburgh Botanic Garden.

The Gardeners' Chronicle thinks it far too little known, but one which all true plant lovers appreciate.

Scientific and Useful.

WHAT ARE SPECIES?*

BY PROF. T H. HUXLEY.

IN its most general acceptation the word "species" signifies a kind or sort of something, which something is the *genus* to which the species belongs. Thus, a black stone is a species of the genus stone; a gray horse is a species of the genus horse; a scalene triangle is a species of the genus triangle; and, generally, it may be said that every adjective denotes a species of the genus indicated by the substantive to which it is applied.

The individual object alone exists in Nature; but, when individual objects are compared, it is found that many agree in all those characters which, for the particular purpose of the classifier are regarded as important, while they differ only in those which are unimportant; and those which thus agree constitute a species, the definition of which is a statement of the common characters of the individuals which compose the species.

Again, when the species thus established are compared, certain of them are found to agree with one another, and to differ from all the rest in some one or more peculiarities. They thus form a group, which, logically, is merely a species of higher order, while technically it is termed a "genus." And, by a continuation of the same process, genera are grouped into families, families into orders, and so on. Each of the groups thus named is in the logical sense a genus of which the next lower groups constitute the species.

It is conceivable that animals and plants should have been known to us only by their remains preserved in museums or in the fossil state. If this had been the case, biological, like mineralogical species, could have been defined only by morphological characters; that is to say, by the peculiarities of their outward form and inward structure; and, as a matter of fact, this is the state of our knowledge in respect of a large proportion of the existing fauna and flora of the world, and of all extinct animals and plants.

A botanist or a conchologist who sets to work to arrange a newly-received collection sorts his plants or his shells out according to their likenesses and unlikenesses of form and structure, until he has arranged them into groups of individuals which agree in certain constant characters and differ only by insignificant features, or by such peculiarities as vary in different individuals in such a manner that an insensible gradation can be traced between those forms which have the peculiarity strongly marked and those in which it is absent.

The fact that living beings originate by generation from other living beings is one of the circumstances in their history which most completely differentiates them from minerals. This process of generation enters in various ways into the conception of biological species.

It is a generally assumed axiom in biology that whatever proceeds from a living being by way of generation is of the same species as that from which it proceeds, whether the morphological differences between parent and offspring be great or small. The two sexes are often extraordinarily different, and in cases of the so-called alternation of generation the successive zooids may differ very widely; but, inasmuch as the differing forms in these cases proceed from the same parents, no one doubts that they belong to the same species. The breeds of domesticated animals and plants often differ morphologically as widely as admitted species, but, apart from other considerations, historical evidence that they have the same parentage suffices to cause them to be regarded as of one species. It is not quite clear that the converse of the axiom, which has just been referred to, would be admitted, and that living beings which arise from totally distinct parents are of different species, even though morphologically identical. The wellnigh exploded hypothesis of the multiplicity of centres of origin for species of wide distribution implies the belief that groups of individuals which have proceeded from distinctly-created parents may, nevertheless, be of the same species, while the supporters of the no less nearly extinct hypothesis of the independent creation of the fauna and flora of successive formations used to affirm that, although indistinguishable, two forms from separate formations must be of distinct species, because they had been created separately. However, these subtilties have ceased to have any practical importance.

In the next place it is observed that, while individuals of the same morphological species breed freely with one another and give rise to perfectly fertile offspring, the unions of individuals of different morphological species are, as a rule, either unfertile or imperfectly fertile. Thus fertility, like parentage, has become a physiological character of species; and, though in the case of some domesticated animals, as pigeons, the extreme forms are more different from one another than many morphological species, yet they, apart from the historical evidence of their parentage, are held to be members of the same species, because they are all perfectly fertile one with another, and their offspring are also perfectly fertile.

Thirdly, it is a matter of experience that, as a general rule, and taking the whole cycle of forms through which a living being runs into account, offspring and parent are so similar that they belong to one and the same morphological species; and it is further in evidence that many species have endured for extremely long periods without any notable difference being discernible between ancestor and descendant. Moreover, in some cases, varities are found to revert to the character of the species from which they have proceeded. The conclusion has been drawn that the character of species is physiologically fixed; that is to say, that, however long the process of generation may be continued, the individuals either retain the identical morphological character of the oldest ancestor, or, if they vary, the varieties remain fertile with one another.

Assuming that species have the physiological character thus enumerated, certain conclusions respecting the "origin of species" are inevitable. It is clear that no existing species can have arisen by the intercrossing of pre-existing species, or by the variation of pre-existing species, but that every species must have existed from all eternity, or have come into existence suddenly in its present form, which is the objective fact denoted by what is termed creation.

* Extracts from The Popular Science Monthly.

INDIA INK.

IT is often desirable to finish photographs and drawings in India ink, in order to get the best effect, and this can be done by a tasteful person, at home, fully as well and with greater satisfaction, than when sent to some distant professional. The greatest trouble is the difficulty of procuring genuine Chinese ink. The Scientific American recently gave, in answer to a request, the following formula for preparing a perfect India ink, the formula being copied from Riffault's treatise on the manufacture of colors:

Calcined lampblack, 100 parts; boghead shale black, in impalpable powder, 50 parts; indigo carmine, in cakes, 10 parts; carmine lake, 5 parts; gum arabic (first quality), 10 parts; purified oxgall, 20 parts; alcoholic extract of musk, 5 parts.

The gum is dissolved in 50 or 60 parts of pure water, and the solution filtered through a cloth. The indigo carmine, lake, lampblack and shale black are incorporated with this liquor, and the whole ground upon a slab, with a muller, in the same manner as ordinary colors, but in this case the grinding takes much longer. When the paste is thoroughly homogeneous, the oxgall is gradually added, and then the alcoholic extract of musk. The more the black is ground, the finer it is. The black is then allowed to dry in the air, until it has acquired sufficient consistency to be molded into cakes, which in their turn are still further dried in the air, out of the reach of dust. When quite firm, these cakes are compressed in bronze molds, having appropriate designs engraved upon them. The molded ink is then wrapped in tinfoil, with a second envelope of gilt paper. The ink which has been prepared in this manner possesses all the properties of of the real Chinese article. Its grain is smooth; it flows very well, mixes perfectly with many other colors, and becomes so firmly fixed to the paper that other colors may be spread over it without washing it out.

TO PRESERVE MUCILAGE.

SALICYLIC acid has been lately recommended for preventing the decomposition of mucilage, which, as generally prepared, undergoes rapid change, becomes sour and ropy, and unfit for use. The very slight solubility of salicylic acid in water renders the use of it less objectionable than would otherwise be the case. Instead of using pure water, the gum is dissolved in an equal weight of a previously prepared aqueous solution of salicylic acid; such a mucilage, even after standing a month, shows no trace of decomposition.

CHLORIDE OF LIME IN MORTAR.—A German scientific journal says that the cracking of mortar through dryness or heat may be prevented by the addition of chloride of lime. Mortar so prepared will stick fast even to glass, metal, and similar substances. It is thought that the addition of glycerine might answer the same purpose.

Insurance Department.

INNOVATION PLANS OF INSURANCE.

WITH the incoming of better times, of which there appear to be, just now, so many encouraging indications, the Life Insurance interest may be expected to resume something of its wonted activity. Neither the Companies that have, throughout the dark days retained public confidence and a fair, though necessarily diminished share of public patronage, nor those that have deservedly forfeited both, will fail to take advantage of the earliest favorable breeze to set their sails anew. The enforced restraint of the last four years has made them all impatient to begin. All of them desire new business, and it may be said of many of them that a considerable infusion of new blood is indispensable to their existence.

The Companies that have satisfied the expectations of their policy-holders and of the public also, by keeping and fulfilling their promises will, of course, enjoy an immense advantage. They can present again their old and tried plans, and, pointing to the results achieved during years of famine, justly and confidently claim to be able to do still better during the coming years of plenty. With these facts well and clearly presented to the public, and attested everywhere by living and grateful witnesses, the Companies whose garments are unsmirched have little to fear from the competition of those who, having worn out their old plans, must invent new and taking devices. Of these there will be no end.

What may be done in the inventive way has already been shown. During the flush times an infinite variety of new plans were gotten up, but they agreed in one particular, that of a continual increase of the proportion of premium to amount insured. There was so much of each premium to pay for insurance proper, and so much for "investment," that would have been profitable if the accompanying promises of dividends had been, or could have been kept. The needy and enterprising Companies will not be slow to discover that these "investment" plans are unsuited to the era of lean purses, and that the plan that can be made to appear cheapest stands the best chance.

For this reason an avalanche of cheap plans may be looked for, plans only the more dangerous because reliable insurance cannot be cheapened beyond certain ascertained limits. The experience of a century has fixed that limit. It may be seen in the premium rates of the better class of Companies. Below this limit lies ruin, disaster. Three score of Companies have broken down in the last five years. Not one of them received smaller premiums. The Company that attempts to insure for a premium *really* lower than the standard, cannot expect permanent success. Less trouble is to be apprehended from *really* than from *seemingly* low rates, and the facility with which the policy can be made by means of clever wording, to say one thing and mean quite another.

A Company now winding up its business, had a plan by which one could be insured for a few years for a very small premium, the policy being ingeniously contrived to be construed to imply that the insurance would continue for life at the same low rate, when in reality it stopped short at the end of five or ten years. Just such traps are now being devised for unwary and unsuspecting people. The best way to treat a new plan is that adopted by prudent people toward all strangers, to withhold confidence until they are known to deserve it

Domestic Economy.

POT-PIES ONCE MORE.

My Dear Sisters:—I am sure I told Mrs. M. L. S. not to tell anybody about that pot-pie of mine, when I wrote to her through the Rural. But somehow the rest of you good cooks all seem to have got hold of the story, and I am glad you have, for I've got five or six new recipes for making pot-pie by this means, though of course, I feel like putting my hands over my eyes or hiding my head under somebody's protecting wing, to get out of sight of so many first-class pot-picists. Yet, I guess, seeing I am so far away from you to-night, it will not be unnecessary to do either. So I'll just sit here at the table, while I'm eating the paper of peanuts my bigger and more patriotic half, brought to keep me company while he is gone to political meeting. (Probably somebody's nose will turn up now—at the idea of liking peanuts—they're so common, but my nose turns up all the time, and I like peanuts too. So *n'importe!*)

Where was I, oh! I was saying I'd just sit here this evening, and write to you all, and express my gratitude as well as I can on a piece of paper. Many thanks then, to the kind sisters who have endeavored through the columns of the Rural to lighten my unleavened pot-pie crust. I do appreciate them all, all their kind efforts in my behalf, and I am so glad I ever thought of a pot-pie piece or a piece of pot-pie because I have enjoyed reading those replies to my article so much. I have sat in my low rocking-chair by my favorite window, and read these words, written to me from those I have never seen, and though I never even expect to see them in this world of perplexities and pot-pies, yet I feel almost as if I knew them, and I don't believe I shall ever again make either pot-pie or ginger cookies without sending a thought to those who have talked to me through the Rural. My taste for pot-pie has by no means abated, but I have not tried any of the recipes yet, as my repeated failures have somewhat dampened my ardor in this particular direction. I intend to try again sometime, and hope to meet with better success, especially as the chickens are getting larger and plumper, and if I should hit one with a piece of the crust, it wouldn't be so much of a loss. It would only make material for another pot-pie. Mrs. Hattie F. Bell.

A SIMPLE MOSQUITO TRAP.

While visiting at the house of a friend, I was one morning surprised to see one of the ladies of the household going through the bedrooms with a short pole about the length of a broom-handle, to which was attached the cover of a mustard box, with a small quantity of kerosene oil within. This, whenever a mosquito appeared on the ceiling was applied, and it fell a victim immediately, in its efforts to escape into the oil. I have proved its worth and hope you will give the readers of the Rural an opportunity of doing the same. E. J. K.

USEFUL RECIPES.

The lady who conducts the "Housekeeper" in Germantown Telegraph contributes the following recipes to its columns:

STEAMED KNUCKLE OF MUTTON.

Take a knuckle of mutton, cover with cut parsley, a few capers, finely cut onions, and thin slices of turnips; season with pepper and salt; let it steam or simmer gently for an hour and a-half, and then have ready melted butter and pour over, allowing it again to steam or simmer for twenty minutes. A beautiful gravy will have collected, and the meat be as tender as a chicken. Garnish with Paysadu tongue, warmed previously by steam. The price of this tongue is far less than our British article, and the tongue has a sweet taste.

BRUSSELS SPROUTS TOSSED IN BUTTER.

Trim them neatly and wash them in several waters. Put them to boil in plenty of salted water, and when almost done strain and dry them in a cloth. Put them in a saucepan with a large piece of butter, pepper, salt and grated nutmeg to taste. Toss them gently on the fire until they are quite cooked.

BROILING MEATS.

When meats are broiling on a gridiron over hot coals, the sudden heat applied sears the outside, which shuts in the juices, and the rapid application of heat soon cooks the meat through, if in moderately thin pieces. It is then tender, juicy and palatable. Those who never broil their fresh meat, fish, or poultry, do not know the excellence of a properly-cooked dish of animal food.

SQUAB PIE.

Season highly some neck mutton-chops with pepper and salt, place them in a dish in layers, with plenty of sliced apples (sweetened) and chopped onions; cover with a good suet crust, and bake. When done, pour all the gravy out at the side, remove the fat, and flavor with mushroom catsup. Pour it back into the pie through a hole in the center.

CHILDREN'S PUDDING.

Cut up a loaf of stale bread the day before it is required, put to soak in a pan of cold water; when going to mix, squeeze the water through a colander; put the bread in a pan, with two ounces of suet chopped fine, two tablespoonfuls of flour, some grated ginger, a little mixed spice; beat well up with a fork; mix half a pound of treacle (not golden syrup) with a little warm milk, then stir altogether, and boil three hours in cloth, basin or mold. This will make a large pudding, much liked by children; it is cheap and wholesome.

SELECTED RECIPES.

To Clean Preserve Jars.—Sweet-meat jars or bottles may be cleaned without scraping them, by pouring into the jars hot water and a teaspoonful or two of pearlash. The contents which remain sticking to the sides and bottom of the jar will be disengaged by the pearlash and float loose in the water.

Removing Smells.—An unwholesome odor can be removed from a room by burning within it sugar or ground coffee.

If a Loaf or cake has become rather too stale for the table moisten it a little and then heat it through in the oven.

Closing Cracks in Cast Iron Stoves.—Good wood ashes are to be sifted through a fine sieve, to which is to be added the same quantity of clay finely pulverized, together with a little salt. This mixture is to be moistened with water enough to make a paste, and the crack of the stove then filled with it. The cement does not peel off or break away, and assumes an extreme degree of hardness after being heated. The stove must be cool when the application is made. The same substance may be used in setting the plates of a stove, or fitting stove pipes, serving to render all the joints perfectly tight.

Eggs Preserved by Silicate of Soda.—Dr. Durand, pharmacist of Blois, has discovered a very efficient means for the preservation of eggs viz., a solution of silicate of soda. This solution, being very viscous, is kept in a liquid state by the addition of tepid water. The eggs are dipped into the solution and then dried; when they have been thus treated, and are well dried, and completely covered with the silicate solution, they can be placed in any receptacle, and may be kept for a year or more without undergoing decomposition.

Mock Apple Pie.—Two crackers (milk or soda) one egg, one cup of sugar, one of water, the juice of one lemon; add a pinch of salt, and spice with nutmeg or the rind of the lemon.

Hygienic Information.

REMEDY FOR KICKING BABIES.

Presuming from the fact that as the following appeared in the American Rural Home, it is a good and effectual remedy, we transfer it to our columns for the benefit of those "to whom it may concern" especially the babies during the coming cold weather.

Bachelor readers will doubtless look to other columns for entertainment, on seeing this heading. Unfortunate and unhappy old bachelors—men of mature life, who have never known a father's pride or a father's love for his little ones!

This class of mankind have most peculiar ideas or theories regarding babies. When they are led to speak of them at all, you hear the innocents spoken of as disturbing families and neighborhoods at night by unseasonable squalls, as though they should be classed with the cats and dogs that make the night hideous. They do not realize that children have any other qualifications than such as make disturbances and trouble. I wonder they do not remark the fact that fathers and mothers seldom complain of children being troublesome, but instead, speak of them with pride, as being the greatest of earthly blessings.

The writer has the most remarkable baby extant (of course), but her kicking "o' nights" is frightful to behold. Whether asleep or awake, her little legs fly about like the wings of a windmill, and the result is a dismantling as complete as the ship in a storm. Thorough investigations on the subject were made without avail. History was silent on the matter in question, though all historical characters have doubtless kicked like mules in their babyhood; cyclopædias were found useless and were set aside with some abuse. Aunts, cousins, grandmothers were consulted, but all claimed that there was no remedy. Being bent on victory, we set our wits at work, and the result was a flannel sack, two feet long by fifteen inches wide, resembling a small grain bag. The kicker was deposited feet foremost therein, and the sack fastened by a band about the waist.

It works like a charm. No more colds. No patent applied for as yet. C. A. Green.

Clifton, N. Y.

ANOTHER REMEDY FOR RHEUMATISM.

Medical Brief reports that Dr. Maclagan has used salicine in rheumatism. He employed it in eight cases, and arrives at the following conclusions:

1. We have in salicine a valuable remedy in the treatment of acute rheumatism.

2. The more acute the case, the more marked the benefit produced.

3. In acute cases, its beneficial action is generally apparent within twenty-four, always within forty-eight hours, of its administration in sufficient doses.

4. Given thus at the commencement of the attack, it seems sometimes to arrest the course of the malady as effectively as quinine cures an ague, or ipecacuanha a dysentery.

5. The relief of pain is always one of the earliest effects produced.

6. In acute cases, relief of pain and a fall of temperature generally occur simultaneously.

7. In subacute cases, the pain is sometimes decidedly relieved before the temperature begins to fall; this is especially the case when, as is frequently observed in those of nervous temperament, the pain is proportionally greater than the abnormal rise of temperature.

8. In chronic rheumatism salicine sometimes does good where other remedies fail; but it also sometimes fails where others do good.

The dose employed was from ten to thirty grains every two, three or four hours, according to the severity of the case. Fifteen grains every three hours Mr. Pemberton conceives to be a medium dose for an acute case.

EXCESSIVE USE OF MEDICINES.

The London Times in speaking of the excessive use of medicines, says that it would be utterly impossible to tell how many constitutions have been impaired, how many digestions ruined, how many complexions spoiled, and how many purses emptied, through medicine. What is that you say—that a stitch in time saves nine, and that the right medicine quickly taken averts danger? Very likely. I quite believe that. But in ninety-nine cases out of a hundred where is the danger? and what is the emergency of the case? Medicine is often the precursor of after misery, and the poor constitution has to pay dearly for its medicinal fillip. The wiser philosophy of the present day is gradually delivering us from these potent perils. Nature has a self-righting power within her; there is a kind of *vis medicatrix* in the physical frame. Treat the body kindly; let as much pure air as possible get to the lungs, and as much fresh water as is needful be applied to the flesh, and as much healthy exercise as duty permits be given to the muscles, and as early rising as circumstances will allow be afforded for the recruitment of the brain, and then medicine will be an avoidable affair.

COMEDONES IN THE FACE.

"Knowing you to be kind and obliging, I take the liberty to ask a great favor of you: Please let there appear among your "Hygienic Notes" next week a cure for "black heads" (or worms) in the face, by so doing you will greatly oblige. I will look eagerly for an answer."—E. J. B.

These black speck "black heads" or worms as they are called arise from impurity of the blood or system, and the only effectual and perfect remedy must come through a restoration of health to all parts of the body. But as a temporary relief, you can use a wash made of thirty-six grains of subcarbonate of soda, in eight ounces of distilled water, perfumed with six drams of essence of roses; Or touch the head of each, with a fine hair-pencil dipped in acetic acid. The acid must only touch the black spot, or it will eat the skin.

Entomological.

GRAIN WEEVILS FROM CONNECTICUT.

In a late number of the Rural New-Yorker I notice that one of your correspondents inquiring about Grain Weevils, which prompts me to ask for information on the same subject. The past summer an insect appeared in my barn and grain-bins, which my neighbors say is a Weevil. If so, they are different from anything of the kind I ever saw before. I send you a few specimens in a goose-quill for determination. Please give me the name of the species and how to exterminate this pest, and oblige—E. E. H., *Woodmont, Conn.*

We regret to inform you that the insects sent are genuine Grain Weevils and a species described by Linnæus a century ago, under the name of *Silvanus Surinamensis*, or Surinams, Grain Weevils; but this pest has become very wide-spread, and is more or less abundant where grain is cultivated extensively or stored in large quantities. It is known in some localities as the Red Weevil, to distinguish it from those belonging to the *Calandra*, which are of a darker color; besides, belonging to quite a distinct family, namely, the *Curculionidæ*, or Snout Beetles, while the *Silvani* belong to the *Cucujidæ*, all of which are very much flattened. The natural breeding place of most of the species is under the bark of trees and old logs. There are ten species of *silvanus* inhabiting or found in the United States; but the most common and destructive is the one you send, and this is truly a great pest.

By placing a specimen under a good lense of moderate magnifying power, the principal specific characters may be seen in six minute-pointed teeth on each side of the thorax, or neck, as it might be termed. This pest is found all over Europe as well as in this country; and the only way of getting rid of it in ordinary open barns and granaries, is to starve it out by keeping all grain out of its reach for two or three years. If they are located in a tight barn, or one that can be shut very close, then fumigating with sulphur, will destroy them. This plan may also be adopted in tight granaries; but, unless the fumes of sulphur can be forced into every crack and corner, enough will escape to soon overrun the place again.

THE ASPARAGUS BEETLE.

C. W. Quin, writing to the London Garden, says of the Asparagus Beetle (*Crioceris asparagi*), "When the beetle first appears it may be controlled, but if allowed to become established, the task is hopeless." Of course we do not know how tenaciously this insect may cling to life in England, but Mr. Quin's remarks would not be applicable to America. With our twenty years experience in fighting this insect, we are far from believing the task of controlling it is hopeless. It is readily kept in check by dusting the plants with freshly-slaked lime, when wet with dew or rain. Whenever the beetles become so numerous as to injure the appearance of the plants, one or two dustings of lime will generally suffice for the season. The application of the lime should always be made when the slugs (larvæ) are most abundant, for the beetles are too nimble to be caught in this manner.

The principal difficulty in the way of fighting such insect pests is that the gardener is ready to retreat before the onslaught upon them is made, being *sure* in advance that it *won't* do any good. There is little use of going into battle without having faith that you will win it.

"PROGRESS AND IMPROVEMENT."

THE RURAL NEW-YORKER,

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

ANDREW S. FULLER, Editor.

ELBERT S. CARMAN, - - Associate Editor.

X. A. WILLARD, A. M., Little Falls, N. Y.,
EDITOR OF THE DEPARTMENT OF DAIRY HUSBANDRY.

G. A. C. BARNETT, Publisher.

TERMS FOR 1877, IN ADVANCE,
INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.50 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $11.25; Seven Copies, and one free, for $16.05; Ten Copies, and one free, $20—only $2 per copy. The above rates *include postage* (under the new law) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 85 cents extra for each subscription. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

ADVERTISING RATES:

Inside, 14th and 15th pages (Agate space)..	40c.	per line
" 13th page.....	50	"
Outside or last page.....	60	"
Fifty per ct. extra for unusual display.

THE DIFFERENCE.

THOSE who own land and till it are very much inclined to think that they fare worse than persons engaged in other avocations. While it is doubtless true that the farmer, gardener and fruit grower is not generally in a position to make large profits or much money by what is termed speculation, still there is a substantial basis to their operations not found at the bottom of a majority of other industries.

The man who sows a field with grain or sets out trees for either use or ornament, has just that amount of property, if no more, which increases while he sleeps, and herein there is a difference between him and the merchant, not in favor of the latter. Goods when once purchased and laid upon the shelves, seldom increase in value, while the sprouting seed and growing plant always does when put into the earth with that purpose in view. We would that all men having the opportunity, should avail themselves of nature's bounty in this direction, planting more trees to grow as time passes, thereby increasing their own individual wealth and that of the community at large at the same time. A man who learns to look upon the bright side of nature while tending his flocks and cultivating his land, is more likely to take pleasure in labor, as well as to do his work better than the one who looks upon the dark side; and we are inclined to think that success or failure often hinges upon this difference in the disposition or peculiarities of different individuals.

An unwilling servant is seldom a good or faithful one, and the same rule holds good in the higher walks of life; hence, every person should endeavor to cultivate a spirit of earnestness which generally adds force in accomplishing our object and leads others to put confidence in whatever we undertake. When we meet a man who, to use a common phrase, is "desperately in earnest" in any scheme or avocation which he may have in hand, our sympathies are enlisted in his behalf in advance of a knowledge of its nature or import and aid is often tendered, although unasked; while a less enthusiastic individual, but equally as worthy, might fail to even attract our attention.

Put more earnestness into your own actions if you would gain the confidence of others, for it is certainly true that the world is always more inclined to help those who are apparently going up hill than down, even though appearances may often be deceptive. Be in earnest and have faith in whatever you undertake and others will catch the spirit of your enthusiasm, whether they will or no.

SCIENTIFIC FARMING.

THERE is no word more misunderstood or, perhaps, distorted among farmers, than the word science as applied to agriculture. It is deemed an empirical, arbitrary, high-flying Something, created by a clique of men filled with vagaries and destitute of common-sense, to be shunned—to be fought off like encroaching flames.

How can the farmer be *made* to know that in just so far as his own operations are conducted skillfully, he is himself a scientific farmer whether he would or no! We once heard a well-to-do farmer say: "If I followed the instructions of your agricultural journals and books I should fail in two years." From his view he was right. He was set in the belief that such journals are written up by men who have gained their ideas of farming from books alone and who are stuffed with all sorts of contradictory, impracticable theories to the exclusion of all that is the outgrowth of labor and observation in the field. Trustworthy agricultural periodicals impart, or aim to impart, only the most efficient methods. They aim to spread over the land *every* new theory that promises to increase the farm yield with the same or less labor and expense. They do not ask or wish the farmer to accept their statements (detractory or laudatory) upon faith, but to excite inquiry and experiment to the end that the good may be accepted, the bad rejected. Is there a shorter or easier road to progress?

Can any farmer suppose that whereas, every other science is progressing with palpable strides from generation to generation—we might almost say from year to year—that the science of farming not only remains but ever must remain *in statu quo?*

It is all wrong to suppose that the editors of and contributors to agricultural journals as well as the authors of agricultural works, are office-men and know little or nothing of farm practice. Many of them have made practical farming the study of their lives. They obtain by work the fabric out of which to shape new material. The hands are made the instruments of furnishing the mind with food which, added to the recorded teachings of those in years past, form the elements out of which original ideas are elaborated and scientific progress insured. The type farmer, as we may designate him, differs from the scientific farmer in but one respect, viz., the former looks to results mainly, the latter to causes as well. For instance, the unscientific farmer applies lime to two fields. Upon the one the crop is unquestionably benefited—upon the other unquestionably injured. He concludes that the one field needs lime, the other does not and this conviction is fixed for life. The scientific farmer finds in these opposite effects important data upon which to establish principles universally applicable. His first inquiry is as to the cause of the difference. Was one field deficient in lime, the other sick of it? Was the soil of one field such that the lime hastened the decomposition of certain slowly-soluble particles which were essential to the vigorous growth of the crop, while upon the other no such slowly-soluble material existed? What manures had previously been used? What is the chemical constitution of the two crops cultivated? These, among many, are a few of the inquiries that at once suggest themselves to the scientific farmer and it is not impossible that their investigation would prove under other methods of cultivation or by the subsequent use of other fertilizers or by extremes of temperature or rainfall, that the very field that produced the scanty crop owing, as was supposed, to the use of lime, would then by its use produce most bountifully; while the other field might in the same degree be rendered unfertile. In this supposable case, though the unscientific farmer's conclusion that lime was harmful in the one instance and beneficial in the other were correct, the conditions remaining unchanged, he gains no inkling of what those conditions are and is necessarily incapable of drawing any inference whatever for his future guidance.

In ridiculing science as applied to farming, farmers know not what they do. Scientific farming may be freely defined as perfect farming—for science is but knowledge—and he who approximates more nearly to this, is to that extent a scientific farmer, though he may be ignorant of every technical word or process known to science, and though the principles which he practises upon his own farm may prove utterly worthless as applied to another. The same may be said of every other science. Is one who reasons accurately and forcibly any the less a logician because he knows not even the signification of the word syllogism? Is a musician any the less a musician because he can not tell one note from another? Is he any the less a mathematician who can compute by a peculiar mental process of his own the number of bricks required to construct a cistern of a given diameter, though he may never have heard of the classic *Pons asinorum?*

The difference then between the good uneducated farmer and the scientific farmer is but one of degree; and in condemning the latter, the former not only condemns himself in so far as he *is* a good farmer, but opposes the acquirement and the dissemination of that knowledge which, directed to causes as well as effects; directed to the recording of all facts appertaining to agriculture from whatever source, provides the sole means by which true knowledge may be gained and disseminated among all people and through all coming ages.

The science of farming is still in its infancy. The profoundest workers are still grpoing in all but darkness—but the dim light in the distance and the flashes that oftener and more brightly lighten up the vista of agriculture, bid us hope that a more constant and brighter light is about to dawn, and he who thrusts himself forward to scorn the noble labors of those who seek to hasten it, whether bylabors in the field, laboratory or study, may live it is to be hoped, to blush over their short-sightedness.

RURAL NOTES.

Rural Premiums Appreciated.—Among the many letters, showing the encouragement given us in our endeavors to send the RURAL forward as a good messenger, the following is from friend GREEN of Allegany Co., who has sent in a RURAL Club ever since he was a boy: "All the Premiums due me from the RURAL have been received in good order and I am much pleased with them, as they are first-class in every respect. As I anticipate sending you more subscriptions for the RURAL for 1877 than *ever before*, I want to fully prepare for the coming campaign for the Old RURAL, which I intend, on my part, to make an *aggressive one*, not merely acting on the *defensive* and taking subscriptions when I can't avoid it, but going out to get them. Yours truly, GEO. A. GREEN, Agent."

Waters' Orchestrian Chimes.—In our last issue our musical critic gave a brief description of this instrument, a new parlor organ just introduced by HORACE WATERS & SONS. He stated a simple fact when he wrote that "it is in advance of anything heretofore offered to the musical public." Our printer has but recently taken up the study of Sanskrit and the best he could do with the "copy" was to make it read, "is in advance of anything heretofore *to offend to* the musical public." This error has cast a gloom over the Sanctum. We regret the mistake and deplore the loss of our esteemed associate. He read the notice and subsequently went to the Asylum a howling maniac.

Rabies Canina in England.—From late English journals we learn that some valuable packs of hounds have had to be killed on account of the presence of rabies and hydrophobia among them. The latest outbreak of this fearful malady caused the destruction of a number of hounds estimated to be worth five hundred pounds, the pack being one of the best in the kingdom. Many theories have been advanced as to the cause of these outbreaks, but none seem to be entirely satisfactory. The malady seems to lurk among the kennels of certain districts.

Patented Plants.—The Editor of the Gardeners' Monthly, in discussing the advisability of giving the originators of new plants "protecting patents," says, "We know of a person who has been some six years working on a new plant and who will probably realize $20,000 for his labor and skill." This we think, is fully as much as a man could think of doing under any horticultural patent law. There are far too many patents now for the welfare of the masses, and to add to the number or facilities for the same might increase instead of decrease their burdens.

Kunfai or Polo.—This East India game is becoming quite popular in America and, like base ball, is likely to bring a crop of broken fingers and shins, if nothing worse happens to those who indulge in the "manly sport." Anything that has any *fun* in it, is always welcome among those who have leisure hours to while away and money to spend in gratifying their tastes, in whatever direction they may happen to run.

The Amsterdam Exhibition.—There is to be a grand International Horticultural Exhibition at Amsterdam, Holland, in 1877, and all the nations of the world are invited to participate therein, as at our Centennial Show. Now let our horticulturists make preparations to show the Dutch what can be done in the way of horticultural products from America.

RURAL BREVITIES.

MR. G. F. NEEDHAM sends us an interesting account of the Potomac Fruit Growers' Association, August meeting, which we cannot publish on account of lack of space.

THE sales of stock, especially Short-Horn, has been brisk this fall and the prices are reported as being quite satisfactory. In fact, the outlook for all kinds of farm stock appears to be good.

THE Early Vermont and Snowflake are reported to have done exceedingly well in England this season and the former is said to promise to become one of the most useful of American varieties.

IT is reported that the authorities of Blue-Earth Co., Minn., have paid for 2,000 bushels of locusts, and that in the entire State where these insects occurred, not less than 50,000 bushels were destroyed the present season.

THERE has been a strong effort by the coal companies during the past few days to put up the price of coal, but without effect. The backbone of the monopolies having been broken, it will be difficult to mend it while labor remains cheap and abundant.

WE are in receipt of two ears of D. A. Compton's early yellow corn, which appears to be an extra fine variety. It is a twelve-rowed sort and we are assured by the originator that it is extra early, the crop this season having been cut up and shocked August 14.

AGAIN we chronicle the visit of a Centennial RURAL Agent—Mr. HENRY HULS, St. Charles, Ills.—who stopped on his way to Philadelphia to have a friendly chat on business prospects, &c. He reports everything flourishing in his State and that the RURAL is gaining friends steadily.

J. Y. BICKNELL, Westmoreland, N. Y., makes an offer of game fowls in his advertisement on another page that should interest poultry fanciers and others. As Mr. BICKNELL carried off about all the honors at the last N. Y. State Fair, it is safe to say his stock is a desirable one to select from.

THERE have been many "corners" in grain, stocks and other articles, but the meanest "corner" we have ever heard of is a "corner" in quinine, sending this useful drug up fifty to seventy-five cents per ounce. This is hard on those who have gotten the "shakes" or malarial fever through their visits to the Centennial.

THE N. Y. Herald, in speaking of the amount of grain on hand ready for shipment, says: "Western warehouses are glutted with grain, which the owners are holding so that the railroads may soon have so much to carry East that they may put on the high tariff rates. Gentlemen farmers, how long will it take you to learn that, so far as export is concerned, the price of American wheat is in Liverpool and nowhere else?"

DR. H. A. GRANT, of Enfield, Conn., writes that he used one of the HALLADAY WIND MILLS, made by the U. S. Wind Mill Co. constantly, day and night, except when his water tank was full, from its erection in 1853 till he replaced it by steam for other purposes in 1872. He further says that its entire cost of repairs during that whole time did not exceed $15 and that with $2 more expenditure it would be good for another five years.

THE advertisement in this issue of Messrs. LORD & TAYLOR should be carefully read, as it gives a succinct list of all the new fall goods with prices. The most stylish stuffs here announced have not been distributed through the country yet and they are, consequently, only attainable in New York. The system adopted by this house as set forth in the advertisement, puts it in any lady's power to avail herself of their facilities without as much expense as would be incurred by trading in her own town and with facilities quite as ample.

"THE PRIDE OF BATTERY B."

South Mountain towered on our right,
Far off the river lay,
And over the wooded hight
We held their lines at bay.

At last the mutt'ring guns were still,
The day died slow and wan.
At last the gunners' pipes did fill,
The Sergeant's yarns began.

When as the wind a moment blew
Aside the fragrant flood,
Our briarwoods raised—within our view
A little maiden stood,

A tiny tot of six or seven,
From fireside fresh she seemed.
(Of such a little one in heaven
One soldier often dreamed.)

And as we stared, one little hand
Went to her curly head
In grave salute. "And who are you?"
At length the Sergeant said.

"And where's your home?" he growled again.
She lisped out, "Who is me?
Why, don't you know? I'm little Jane,
'The Pride of Battery B.'

"My home? Why, that was burned away,
And pa and ma are dead,
And so I ride the guns all day,
Along with Sergeant Ned;

"And I've a drum that's not a toy,
And a cap with feathers, too,
And I march beside the drummer boy
On Sundays at review.

"But now our bacca's all give out,
The men can't have their smoke;
And so they're cross—why even Ned
Won't play with me and joke;

"And the big Colonel said to-day—
I hate to hear him swear—
He'd give a leg for a good pipe
Like the Yanks had over there.

"And so I thought, when beat the drum,
And the big guns were still,
I'd creep beneath the tent and come
Out here across the hill,

"And beg, good Mister Yankee men,
You'd give me some Lone Jack,
Please do—when we get some again
I'll surely bring it back.

"Indeed I will, for Ned—says he—
'If I do what I say,
I'll be a General yet, may be,
And ride a prancing bay.'"

We brimmed her tiny apron o'er.
You should have heard her laugh
As each man from his scanty store
Shook out a gen'rous half.

To kiss the little mouth, stooped down
A score of grimy men,
Until the Sergeant's husky voice
Said "'Tention, Squad!" and then

We gave her escort, till good-night
The pretty waif we bid,
And watched her toddle out of sight,
Or else 'twas tears that hid

Her tiny form, nor turned about
A man, nor spoke a word
Till afterwhile a far hoarse shout
Upon the wind we heard!

We sent it back—then cast sad eye
Upon the scene around,
A baby's hand had touched the tie
That brothers once had bound.

That's all—save when the dawn awoke
Again the work of hell;
And through the clouds of sullen smoke
The screaming missiles fell.

Our Gen'ral often rubbed his glass,
And marveled much to see
Not a single shell that whole day fell
In the camp of Battery "B!"

[*Frank H. Gassaway.*

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 253.]

UTAH.

All that portion of the country acquired from Mexico, lying between parallels 37° and 42°, north latitude, the Rocky Mountains and California, was, previous to its cession to the United States, almost unknown, but few white men having penetrated it. In 1847 the Mormons, driven from Nauvoo, their settlement in Illinois, crossed the Rocky Mountains and penetrating the wilderness so far that they thought themselves forever beyond the reach of the Gentiles—in a land where there would be no governmental authority superior to their own—founded Salt Lake City. But after the treaty of Guadalupe Hidalgo in 1848, they unexpectedly found themselves again under the jurisdiction of the United States. In 1850 the population of this area was said to be about 11,000, mostly located in the immediate vicinity of Salt Lake City. A convention to frame a Constitution was held and a Government organized as the State of Deseret. Congress however, refused to agree to these proceedings and established a Territorial Government. In September of the same year Brigham Young was appointed Governor and the other officers selected from among the Mormon residents. So long as this was continued all went smoothly so far as the Mormons, who were largely in the majority, were concerned; but the Gentiles complained that the laws were so administered as to bear hardly on them, no regard being paid to justice or equity. Their complaints seemed well founded. Some changes being made and Gentiles appointed to office, the Mormons became the complainants and in 1858 they rose in direct rebellion against the Government, compelling the courts to adjourn. It is reported that in a sermon Young preached to his people, he said, "I am and will be Governor, and no power can hinder it until the Lord Almighty says, 'Brigham, you need not be Governor any longer.'" Troops were sent to restore order and at first collisions seemed inevitable; but finally the Mormons were induced to submit, at least nominally.

In 1861 the limits of the Territory were contracted to the area embraced by the 37th and 42d parallels and the 32d and 39th meridians, except that portion east of longitude 111° and west of latitude 41°. In 1862 this area was diminished by making the western boundary longitude 114° 03′ west of Greenwich. Several petitions have been made to Congress praying for the admission of Utah as a State, but as all Constitutions proposed have been framed with a view to the legalization of polygamy, they have been denied.

NEW MEXICO.

The Territory of New Mexico was organized in 1850 from a portion of the area directly ceded by Mexico, and that to which Texas made claim which was adjusted by the compromise of 1850 [see Texas]. Its northern boundary was the 37th parallel of latitude between California and the Rocky Mountains and the 38th° between the Rocky Mountains and the 26th meridian. On the east it was bounded by the 26th meridian; on the south, east of the Rio Grande, by the 37th parallel, separating it from Texas and west of that river by the then northern line of Mexico and west by California. In 1854 the Territory acquired from Mexico and known as the Gadsden purchase, was annexed. In 1861 the portion lying north of the 37th parallel was substracted and in 1863 the area was still further diminished, making the meridian 31° 59′ west from Washington, its western boundary.

WASHINGTON.

In 1853 that portion of Oregon Territory lying north of 46° and the Columbia River was erected into a separate Territory and named Washington. When Oregon was made a State the portion of Oregon Territory not included within the State bounds was temporarily annexed to Washington; but this and the eastern portion of Washington Territory were detached when Idaho was formed, leaving the bounds of Washington Territory as now, viz., the 49°th parallel, longitude 117° 04′, and the Snake River, the 46th parallel and the Columbia River to the Pacific Ocean.

KANSAS AND NEBRASKA TERRITORIES.

A bill for giving Territorial Government to the country westward of Missouri and Iowa under the name of Nebraska was presented in 1852 and met with determined opposition from and defeat by the friends of slavery, who seemed to have determined that no further governments should be organized in which slavery should be prohibited. This bill in substance was again reported in 1853, when the question as to the constitutionality and consequent validity of the Missouri Compromise was raised, but it was never brought to vote. Subsequently Mr. Douglas reported another bill, providing for the erection of two Territories instead of one—Kansas to include the area lying directly west of Missouri to the Rocky Mountains and Nebraska, including all north of Kansas, leaving it for the people to decide all questions relative to slavery for themselves which, after considerable discussion, was passed in May, 1854.

KANSAS.

Up to the time of the proposition to organize the Territory of Kansas, nearly all the accessible area thereof was in possession of different tribes of Indians. But during the time of the discussion of the question, treaties were quietly made by which most of the country within two hundred miles of Missouri was opened for settlement, and no sooner had the territorial bill become a law, than the contest between the friends of freedom and those of slavery (which had before been one of fierce debate and angry words) became one of physical strife—of blows and bloodshed, which continued, with but little intermission, for several years.

Residents of Western Missouri hastened to take possession of the new territory for slavery, and within a few days after the passage of the Kansas-Nebraska bill hundreds of Missourians crossed the border, professed to be citizens and organized societies which passed resolutions to the effect that they recognized slavery as established, invited slaveholders with their slaves to join them, and declaring that no abolitionist should be given countenance or protection.

In 1854 emigration from the free States began to be considerable. The friends of freedom had moved in the matter. Societies were formed—mostly in New England—known as Emigrant Aid Societies—for the purpose of assisting those who were willing to settle in the new territory. This was met with an expressed determination on the part of the pro-slavery party in Kansas and their allies in Missouri, to remove all persons who should come there under the auspices of any of these societies.

In July, 1854, the first company of Eastern emigrants, about thirty in number, located on the site now occupied by the city of Lawrence, and in two weeks they were joined by sixty or seventy more. They were ordered to remove, but not choosing to obey, they commenced defensatory preparations against their enemies who, although more than twice their number, concluded to leave them, for the time, unmolested.

A Territorial Government was established in the autumn of 1854 and Andrew H. Reeder appointed Governor. At an election for delegate to Congress held soon after, the polls were seized by armed men from Missouri and more than half of the votes were, as was afterward ascertained, polled by residents of Missouri.

A Territorial Legislature was chosen in March, 1855, in much the same way. Gov. Reeder set aside the election in some districts and ordered new ones at which Free State delegates were chosen, who were however, refused their seats in the Legislature, which were given to those illegally elected. This Legislature, known as the Lecompton, met at Pawnee in July and passed several acts bearing heavily on the Free State men and supporting slavery to the fullest extent, some of which were vetoed by Gov. Reeder. This action on his part offended the leaders of the party and he was removed from office by the President, who appointed Wilson Shannon in his place.

The Free State men refused to recognize the authority of this Legislature, held an election, appointed ex-Gov. Reeder delegate to Congress, and called a Constitution and Convention which was held at Topeka in October, 1855, at which a Constitution was framed, and in January, 1856, an election for State officers and members of the Legislature was held; Charles Robinson was chosen Governor. The Legislature met at Topeka in March, organized, inaugurated the Governor, and adjourned till July.

Meantime the numbers in the pro-slavery ranks increased largely by accessions from the Slave States, and under various pretexts assaults were made on the free settlers. From this time the Territory was in the utmost confusion; collisions were frequent and many were killed. Gov. Shannon was recalled by the President and Gov. Geary superseded him. Before the arrival of Gov. Geary the acting Governor had declared the Territory in a state of rebellion. Thousands of armed men—"Border Ruffians"—came from Missouri and other Slave States to aid in putting it down. Gov. Geary commanded all to lay down their arms and met the Missourians with United States troops, compelling their obedience.

The Free State or Topeka Legislature met in January, 1857. The officers and some of the principal members were arrested by the United States Marshal and the rest adjourned till June. About this time Gov. Geary resigned and was succeeded by Robert J. Walker.

The Lecompton Legislature met soon after and provided for a Convention to prepare a State Constitution. The Free State men declined to vote for delegates at the election, which was held June 15; but at a Territorial election held a few months subsequently, the free settlers took part, having the assurance of Gov. Walker that they should be protected in their rights so far as was in his power. The result was the election of a Free State delegate to Congress and a large majority of anti-slavery members to the Legislature.

The Free State men had declined to vote on the question of the acceptance of the Constitution framed by the Lecompton Convention, and the slavery clause was adopted by a large majority. Many of its provisions were obnoxious to Gov. Walker who, failing in his remonstrance against its adoption by Congress, resigned, and J. W. Denver was appointed.

The Lecompton Constitution having been promulgated, an election for State officers under it was called, to be held January, 1858, and the Territorial Legislature directed the slavery clause in the Constitution, which was to be submitted directly to the vote of the people, to be voted on at the same time. The result was a large majority against slavery. Congress decided that the Lecompton Constitution should be again submitted to the people in August, 1858, when it was again rejected. Shortly after Gov. Denver resigned and Samuel Medary was appointed Governor.

Another Constitutional Convention was held by authority of the Territorial Legislature, at Wyandot, in July, 1859, at which a Constitution prohibiting slavery was adopted. This was ratified by the people in October and an election was held under it in December, at which Charles Robinson was chosen Governor.

Application for admission as a State with the Wyandot Constitution, was made to Congress in February, 1860, which was refused. At the next session the application was renewed, which, being granted, made Kansas the thirty-fourth State in the Union, with boundaries embracing all territory between the 37th and 40th degrees of latitude and between Missouri and the 102d degree of longitude, with the very appropriate motto, "*Per aspera ad astra.*"—[To be continued.

THINGS TO RRMEMBER.

You must listen to your wife, and not believe her.

One may do without mankind, but one has need of a friend.

The happiest mother of daughters is she who has only sons.

The pleasure of doing good is the only one that never wears out.

To cultivate virtue is the science of men; to renounce science is the virtue of women.

If one is not deaf and stupid, what a position is that of a father-in-law! If with a wife and a daughter-in-law one has also sisters and sisters-in-law, daughters and nieces, one ought to be a tiger to be able to hold out.

The Story-Teller.

MY LITTLE SCHOOL-GIRL.

The first time that I saw her was one autumn morning as I rode to town in a horse car. It was early, and my only fellow passenger was a crusty old gentleman who sat in a corner reading his paper; so when the car stopped I glanced out to see who came next, hoping it would be a pleasanter person. No one appeared for a minute and the car stood still, while the driver and conductor looked in the same direction without any sign of impatience. I looked also; but all I could see was a little girl running across the park, as girls of twelve or thirteen seldom run nowadays, if any one can see them.

"Are you waiting for her?" I asked of the conductor, who stood with his hand on the bell and a good-natured smile in his eye.

"Yes, ma'am; we always stop for little missy," he answered; and then up she came, all rosy and breathless with her long run.

"Thank you, very much. I'm late to-day and was afraid I should miss my car," she said, as he helped her with a fatherly air that was pleasant to see. Taking a corner seat, she smoothed the curly locks, disturbed by the wind, put on her gloves and settled her books in her lap and then modestly glanced from the old gentleman in the opposite corner to the lady near by. Such a bright little face as I saw under the hat-rim, happy blue eyes, dimples in the ruddy cheeks and the innocent expression which makes a young girl so sweet an object to old eyes!

The crusty gentleman evidently agreed with me, for he peeped over the top of the paper at his pleasant little neighbor, as she sat studying a lesson and cheering herself with occasional sniffs at a posy of mignonette and sweet peas. When the old gentleman caught my eye he dived out of sight with a loud "hem!" but he was peeping again directly, for there was something irresistibly attractive about the unconscious lassie opposite; and one could no more help looking at her than at a lovely flower or a playful kitten.

Presently she shut her book with a decided pat and an air of relief that amused me. She saw the half smile that I could not repress, seemed to understand my sympathy and said, with a laugh, "It was a hard lesson, but I've got it!" So we began to talk about school and lessons and I soon discovered that the girl was a splendid scholar, whose only drawback was, as she confessed to me, "love of fun."

We were just getting to be quite friendly when several young men got in, one of whom stared at the pretty child till even she observed it, and showed that she did by the color that came and went in her cheeks. It annoyed me as much as though she had been my own little daughter—for I like modesty and have often been troubled by the forward manners of school-girls, who seem to enjoy being looked at. So I helped her out of her little trouble by making room for her between the old gentleman and myself and motioning her to come and sit there. She understood at once and thanked me with a look and nestled into the safe place so gratefully that the old gentleman glared over his spectacles at the rude person who had disturbed the serenity of the child.

Then we rumbled along again, the car getting fuller and fuller as we got down town. Presently an Irishwoman with a baby got in, and before I could offer my seat my little school-girl was out of hers with a polite, "Please take it, ma'am; I can stand perfectly well."

It was prettily done and I valued the small courtesy all the more, because it evidently cost the bashful creature an effort to stand up alone in a carfull of strangers, especially as she could not reach the strap to steady herself and found it difficult to stand comfortably.

Then it was that the crusty old gentleman showed how he appreciated my girl's good manners, for he hooked his cane in the strap and gave it to her, saying with a smile that lighted up his rough face like sunshine, "Hold on to that, my dear."

"Ah," thought I, "how little we can judge from appearances! This grim old soul is a gentleman, after all."

Turning her face toward us, the girl held on to the stout cane and swayed easily to and fro as we bumped over the rails. The Irishwoman's baby, a sickly little thing, was attracted by the flowers and put out a small hand to touch them, with a wistful look at the bright face above.

"Will baby have some?" said my girl, and made the little creature happy with a gay sweet-pea and some red leaves.

"Bless your heart, honey, it's fond he is of the likes o' them, and seldom he gets any," said the mother gratefully, as she settled baby's hood and wrapped the old shawl round his feet.

Baby stared hard at the giver of the posies, but his honest blue eyes gave no offence and soon the two were so friendly that baby boldly clutched at the bright buttons on her sack and crowed with delight when he got one, while we all smiled at the pretty play and were all sorry when the little lady, with a bow and a smile to us, got out at the church corner.

"Now, I shall probably never see that child again; yet, what a pleasant picture she leaves in my memory," I thought to myself, as I caught a last glimpse of the brown hat going round the corner.

But I did see her again many times that winter, for not long after, as I passed down a certain street near my winter quarters, I came upon a flock of girls—eating their luncheon as they walk-

ed to and fro on the sunny side—pretty, merry creatures, all laughing and chattering at once, as they tossed apples from hand to hand, munched candy or compared cookies. I went slowly to enjoy the sight, as I do when I meet a party of swallows on the common, and was wondering what would become of so many budding women, when all of a sudden I saw my little school-girl.

Yes, I knew her in a minute, for she wore the same brown hat and the rosy face was sparkling with fun as she told secrets with a chosen friend, while eating a wholesome slice of bread and butter, as only a hungry school-girl could. She did not recognize me, but I took a good look at her as I went by, longing to know what the particular secret was that ended in such a gale of laughter.

After that, I often saw my girl as I took my walks abroad and, one day, could not resist speaking to her when I met her alone, for usually her mates clustered around her like bees about their queen, which pleased me, since it showed how much they loved the sunny child.

I had a paper of grapes in my hand and when I saw her coming, whisked out a handsome bunch all ready to offer, for I had made up my mind to speak this time. She was reading a paper, but looked up to give me the inside of the walk. Before her eyes could fall again, I held out the grapes and said, just as I had heard her say more than once to a schoolmate at lunch time, "Let's go halves." She understood at once, laughed, and took the bunch, saying with twinkling eyes:

"O, thank you! they are beauties!"

Then, as we went on to the corner together, I told her why I did it, and recalled the car ride. "I'd forgotten that, but my conductor is very kind and always waits for me," she said, evidently surprised that a stranger should take such an interest in her small self. I did not have half time enough with her, for a bell rang and away she skipped, looking back to nod and smile at the queer lady who had taken a fancy to her. A few days after and a fine nosegay of flowers was left at the door for me, and when I asked the servant who left them, he answered:

"A little girl asked if a lame lady didn't live here and when I said yes, she told me to give you these and say, "The grapes are very nice."

I knew at once who it was and enjoyed the funny message immensely; for when one leads a quiet life, little things interest and amuse.

Christmas was close by and I planned a return for the flowers of a sort that I fancied my young friend would appreciate. I knew that Christmas week would be a holiday so, the day before it began, I went to the school just before recess and left a frosted, plummy cake directed to "Miss Goldilocks, from she knows who."

At first, I did not know how to address my nice white parcel, for I never had heard the child's name. But thinking over the matter, I remembered that she was the only one there with yellow curls hanging down her back, so I decided to risk the cake with the above direction. The maid took it in (for my girl went to a private school), smiled, and said at once she knew whom I meant. I left my cake and strolled round the corner to the house of a friend, there to wait and watch for the success of my joke, for the girls always went that way at recess.

Presently the little hats began to go bobbing by, the silent street to echo with laughter and the sidewalk to bloom with gay gowns, for the girls were all out in winter colors now. From behind a curtain I peeped at them and saw, with great satisfaction, that nearly all had bits of my cake in their hands and were talking it over with the most flattering interest. My particular little girl, with a friend on each arm, passed so near me that I could see the happy look in her eyes and hear her say, with a toss of the bright hair:

"Mother will plan it for me and I can get it done by New Year's. Won't it be fun to hang it on the door some day and then run!"

I fancied that she meant to make something for me and waited with patience, wondering how this odd frolic with my little school-girl would end.

New Year's day came and passed, but no gift hung on my door; so I made up my mind it was all a mistake and, being pretty busy about that time, thought no more of the matter till some weeks later, as I came into town one day, after a visit in the country. I am fond of observing faces, and seldom forget one if anything particularly attracted my attention to it. So, this morning, as I rode along, I looked at the conductor, as there was no one else to observe, and he had a pleasant face. Somehow, it looked familiar; and after thinking idly about it for a minute, I remembered where I had seen it before.

He was the man who waited for "little missy," and I at once began to hope that she would come again, for I wanted to ask about the holidays, remembering how "fond of fun" she was.

When we came to South End Square, where I met her first, I looked out, expecting to see the little figure running down the wide path again and quite willing to wait for it a long time if necessary. But not one was to be seen but two boys and a dog. The car did not stop and, though the conductor looked that way, his hand was not on the strap and no smile on his face.

"Don't you wait for the little girl now?" I asked, feeling disappointed at not seeing my little friend again.

"I wish I could, ma'am," answered the man, understanding at once, though of course he did not remember me.

"New rules, perhaps?" I added, as he did not explain, as he stood fingering his punch, and never minding an old lady, wildly waving her bag at him from the sidewalk.

"No, ma'am; but it's no use waiting for little missy any more, because"—here he leaned in and said very low—"she is dead;" then turned sharply round, rung the bell, put the old lady in and shut the door.

How grieved I was to have that pleasant friendship end so sadly, for I had planned many small surprises for my girl and now I could do no more, could never know all about her, never see the sunny face again or win another word from lips that seemed made for smiling.

Only a little school-girl. Yet how many friends she seemed to have, making them unconsciously by her gentle manners, generous actions and innocent light-heartedness. I could not bear to think what home must be without her, for I am sure I was right in believing her a good sweet child, because real character shows itself in little things, and the heart that always keeps in tune makes its music heard everywhere.

The busy man of the horse-car found time to miss her; the schoolmates evidently mourned for their queen; for when I met them they walked quietly, talked low, and several wore black bows upon their sleeves; while I, although I never knew her name or learned a single fact about her, felt the sweetness of her happy nature and have not yet forgotten my little school-girl.—*Louisa M. Alcott.*

GRUMBLING ABOUT NEWSPAPERS.

Grumbling about newspapers, says the Boston Traveler, is as ancient as newspapers themselves. And, notwithstanding the multiplication of these modern conveniences and the sleepless efforts of publishers to adapt their paper to every variety of taste and every grade of sentiment, affording, one might think, ample opportunity to readers to suit themselves perfectly—yet there is still, perhaps, as much grumbling about newspapers as there ever was. We suppose it does not often occur to the grumblers that possibly they themselves may be at fault, may be unreasonable, may expect impossibilities, may be out of humor, may have a fit of indigestion or spleen, or may be stupid or unappreciative. It may never occur to them that the men who toil night and day to furnish them with the latest news and the greatest variety of information and entertainment, are mortal, and sometimes tire themselves, and get sleepy and cross and stupid, and forgetful and careless, and need and deserve, too, some consideration and even sympathy from those for whom they unceasingly work.

Fault-finding readers do not consider that everything that is made by human brains and hands must, of necessity, be imperfect, however strong the desire and however earnest the effort may be to have it faultless. And above all, they forget that a newspaper cannot be made for general circulation and yet, in everything, exactly suit any one person. A thoroughly good, enterprising newspaper, is really like a well-spread dinner table. It contains variety as well as quantity; something for every taste and enough of each kind to satisfy any reasonable appetite. It is not expected that any guest of a table should eat of every dish provided. It is not supposed for a moment that every dish will be palatable to every guest or agree with every one's digestion; but it is thought and reasonably, too, that from the abundant bill of fare every guest can select enough that will be digestible and agreeable to make a substantial and satisfactory meal. Just so it is with every well-edited newspaper. No man is expected to read everything in the paper or to like everything if he reads it; but every man is expected to find enough that is good and useful and acceptable and agreeable in the ample columns spread out before him, to be a full equivalent for what the paper costs; and if he happens to find on the *carte* an article which offends his taste, or is in opposition to his views, he has just to let that alone and leave it for another, whom it will just suit and for whose taste it was gotten up. In choosing his paper one should do just as he does in choosing his restaurant; he should select one whose general style suits him, and when his taste changes or the character of the paper deteriorates, he should change and try another; but never fret himself or vex his neighbors by grumbling and scolding about his newspaper which, after all, is just about as necessary to his comfort as his dinner.

The Literary World.

RECENT LITERATURE.

What Tommy Did. By Emily Huntington Miller. Chicago: S. C. Griggs & Co.

If all who take a lively interest in children will read "What Tommy Did" and how perfectly naturally he did it, they will be amply rewarded for their trouble in the pleasure to be obtained. It is evident that the author knows just what such little fellows do and say, for she has drawn a number of pretty pictures in such simple language that a child too young to read it would be interested in it. This book is one of the excellent results of the great progress made of late years in the literature for the young. Even within our own recollection it was next to an impossibility to find a child's book which did not recount the hackneyed story of the good little boy who died young, full of religious fervor, at an age when all religion must have been a sealed book. Now, however, people have come to think that children should be treated to something more nearly similar to actual life. Tommy in this book is sometimes intensely natural. In addition to all this, the book is neatly printed and beautifully illustrated.

Our Behavior. A Manual of Etiquette and Dress of the Best American Society. By Mrs. E. B. Duffey. Philadelphia: J. M. Stoddart & Co. (8vo.—pp. 320.)

The above title would naturally indicate a much less interesting work than the one before us. While laying down certain rules of conduct under the various ordinary and many of the extraordinary situations in life, it reaches further and embraces reasons for the rules which can be applied to other cases and can by the exercise of a little common sense, be made useful on many occasions. Of course the book is largely a transcript of the author's own peculiar ideas upon many subjects; but did we object to some of them, we should find a large majority which accord exactly with our own. Among the miscellaneous rules we cull the following as an example:

"Moderation in Speaking.—Always express your own opinions with modesty, and if called upon defend them, but without that warmth which may lead to hard feelings. Do not enter into argument. Having spoken your mind and thus shown you are not cowardly in your beliefs or opinions, drop the subject and lead to some other topic. There is seldom any profit in idle discussion.

"Boasting.—Never boast of birth, money or friends, or of any superior advantages which may be yours."

Elements of English Grammar. By S. W. Whitney, A. M. New York: J. W. Schermerhorn & Co.

In the short time permitted us for the examination of Prof. Whitney's work, we are deterred from many comments which might be pleasant or otherwise. We can safely say that he has condensed the matter into a very reasonable bulk and has omitted much unnecessary verbiage usually found in text books and especially grammars of the English language. He very properly throws out Orthography and Prosody, the latter of which in early youth we were wont to stumble through and wonder what it was all about. He divides his work into Etymology and Syntax and confines himself to those. This simplifies the study and enables pupils to take it up understandingly at a much earlier age. Another instance of the growing tendency to divide into specialties and again subdivide these, resulting from the rapid progress of the world.

American Dairying. A Manual for Butter and Cheese Makers. By L. B. Arnold, A. M. (Pp. 354—Illustrated.) Rochester, N. Y., 1876: Rural Home Publishing Co.

This appears to be a very carefully prepared work, in which the author gives the results of his investigation, observations and experiences, and we have no doubt it will be well received by the dairymen of the country. There is certainly a need of a dissemination of a greater amount of scientific knowledge among those who make dairying a business wholly or in part, and no farmer who keeps a few or many cows can afford to remain in ignorance of the best methods of treatment, both of the animals and their product, when it can be had so cheaply as in the work before us.

Elements of Latin Grammar. By Gustavus Fischer, LL.D. New York: J. W. Schermerhorn & Co.

The names of its publishers as well as of its author, are a safe guaranty that this Grammar is well worth the examination of all teachers who desire that their instruction shall be imparted in the most economical and attractive manner. The author in his preface says:—"The best elementary instruction in Latin is that which enables the student to read and understand the classical authors in the shortest possible time." He seems to have kept this constantly in view throughout his work.

Countess of Rudolstadt. By George Sand. Philadelphia: T. B. Peterson & Brothers. (Pamphlet; price, 75c.)

The reading public are so familiar with this sequel to "Consuelo" and one of the best novels ever written by this celebrated author, that comment is unnecessary. It is published in this cheap form to put it within the reach of everybody, and is one of the many novels issued by this firm which have retained their popularity for a long period. All who like mysteries should read it and they will be thoroughly gratified.

BOOKS RECEIVED.

From T. B. Peterson & Brothers, Phila., Pa.:

Lady Ernestine; or, the Absent Lord of Rocheforte. By Mrs. C. A. Warfield. [Cloth.—pp. 528.]

Freeman & Smith, Racine, Wis.: Centennial Catalogue of Florists' Ornamental Goods.

Sabbath Reading.

THE COBLE.

The eye was filled by the heave and the flash,
The ear was filled by the roar,
As the great wind blew from the wild northwest,
And the great waves crashed on the shore;
The sky hung black and angry
Over the raging sea,
And away, where the mighty billows rolled,
And the spray flew fast and free,
The broad brown sail of the coble
Quivered and filled and shook,
And out on the pier the fishermen
Stood stern and pale to look.

The eye was filled by the heave and the flash,
The ear was filled by the roar;
The coble tossed and veered and tacked,
As she strove to make the shore;
Ready with rope and rocket
The stalwart coast guard stood,
And ever and ever fiercer rose
The fierce North Sea at the flood;
And the sail of the home-bound coble
Still fearless flew and brave,
Amid the howl of the rising wind
And the crash of the rising wave.

At last she fetched the harbor,
And rode o'er the foaming bar,
While the cheer of the eager watchers blent
With the thunder on the Scar;
And I thought, just so, 'mid the turmoil,
The fret and the fever of life
A heart fares, striving and straining
'Gainst the currents of earthly strife.
Ah, let us keep sail and compass,
Hope's star and the anchor of faith,
And so glide to the haven where we would be,
O'er the last long wave of Death!

[*All the Year Round.*

WHAT IS CHRIST TO US?

He is our way: we walk in Him.
He is our truth: we embrace Him.
He is our life: we live in Him.
He is our lord: we choose Him to rule over us.
He is our master: we serve Him.
He is our teacher: instructing us in the way of salvation.
He is our prophet: pointing out the future.
He is our priest: having atoned for us.
He is our advocate: ever living to make intercession for us.
He is our Saviour: saving to the uttermost.
He is our root: we grow from Him.
He is our bread: we feed upon Him.
He is our fold: we enter it by Him.
He is our shepherd: leading us into green pastures.
He is the true vine: we abide in Him.
He is the water of life: we slake our thirst in Him.
He is the fairest among ten thousand: we admire Him above everything.
He is the brightest of the Father's glory, and the express image of His person: we strive to reflect His likeness.
He is the upholder of all things: we rest upon Him.
He is our wisdom: we cast all our imperfections upon Him.
He is our sanctification: we draw all the sources of holy life from Him.
He is our redemption: redeeming us from all iniquity.
He is our healer: healing all our diseases.
He is our friend: relieving us from all our necessities.

And when we need Him no longer on earth, He is the Lamb in the midst of the throne above, the light of Heaven, leading us into living fountains of water.—*N. Bishop.*

SENDING PRAYERS IN A CART.

Spurgeon, the celebrated London preacher, tells the following story:—A poor man who had a very large family gave them a comfortable support while he was in health. He broke his leg, and was laid up for some weeks. As he would be for some time destitute of the means of grace it was proposed to hold a prayer meeting at his house. The meeting was held by Deacon Brown. A loud knock at the door interrupted the service. A tall, lank, blue-frocked youngster stood at the door with an ox goad in his hand, and asked to see Deacon Brown. "Father could not attend this meeting," he said, "but he sent his prayers, and they are out in the cart." They were brought in the shape of potatoes, beef, pork and corn. The meeting broke up without the benediction. Nor did the poor fellow suffer during his whole confinement. The substantial prayers of the donors became means of grace.

THE DIVINITY ABOUT US.

It is pleasant to know a great many people in this world, the more the better, for every child from the beginning is a new manifestation of God, made in His image, but His image is infinite, thus producing an infinite variety, and thus, too, comes our innate respect for the normal states of all our brothers and sisters. We feel the divinity of each and are bound to respect it, though widely different may be the "gifts" of our spirits. And though we expect goodness, yet it is surprising, in journeying about, how many good people you will meet with, yes, how universally good they are, and how much you learn of God's heart and mind from them, and how your own heart blesses God for His goodness thus manifested. Ruskin says out of every face can be made an ideal, and I think, to do this, the labor wouldn't differ so much between face and face as we might think.

Ladies' Portfolio.

"FOR THOUGHTS."

A PANSY on his breast she laid,
Splendid and dark with Tyrian dyes!
"Take it, 'tis like your tender eyes,
Deep as the midnight heaven," she said.

The rich rose mantling in her cheek,
Before him like the dawn she stood,
Pausing upon life's hight, subdued,
Yet triumphing, both proud and meek.

And white as winter stars intense
With steadfast fire his brilliant face
Bent toward her with an eager grace,
Pale with a rapture half suspense.

"You give me then a thought, O sweet!"
He cried, and kissed the purple flower,
And bowed by love's resistless power,
Trembling he sank before her feet.

She crowned his beautiful bowed head
With one caress of her white hand;
"Rise up, my flower of all the land,
For all my thoughts are yours," she said.

[*Celia Thaxter.*

THE HOLLERING WOMAN.

THERE IS, says the Burlington Hawkeye, one "hollering woman" in every street. A woman who never goes after anybody, but always calls across the street. Who never looks for her children, but rushes to the front gate and shrieks for them until, in the pauses of her shouting, she hears them answering from the room she has just left. Every street has one "hollering woman." No street has more, for as soon as two "hollering women" are thrown by pitiless fate upon one street, the neighbors vacate and emigrate until rents come down, or, as oftener happens, one of the "hollering women" pulls up stakes and goes elsewhere, for they cannot brook opposition.

The "hollering woman" generally manages to keep her street in a lively state of elocutionary excitement, and if you happen to live within understanding distance your diurnal serenade is something like this: "Tommy! Tom-*mee! Tom*-my! Oh, Tom! *You* Tom! Come right along here and break up some of this dry wood, or I'll break your back! Mary! *You* Mar-ee! You get right down off that tree-box this minit, you great tom-boy, or I'll skin you within an inch of your life! Ma-*ree!* Oh, Miss Packard! Miss Packard! Oh-h-h! Miss Packard! Won't you tell your milkman, when he comes, to stop at my gate? Mine came this morning before we was up. E-ras-*mus!* *E*-rasmus! *E-e-e*-rasmus! *E-e-e-ras*-mus! Come right home and take this pail of molasses back to the grocery, and tell him if he can't send what I ordered, I don't want any! *Eras*mus, I say! Oh, Miss Harrison! How's the baby's measles? Did you try that tea I sent over last night? Who cut your new polonaise? Ma-*ree! Mary!* Where's Emmeline gone to, I'd like to know? Didn't I tell you not to let her get out of your sight a minit! Now, you hunt her up and bring her right home. Good morning, Miss Barnaby! Did you know there was burglars over to Throopses last night? Got in at the kitchen winder, and took a pair of Mr. Throop's pants with a dollar and a half in 'em, and Miss Throop's big jet breastpin! Where you going? *Tom*-my! Tom-*mee!* Oh, *Tom!* Mary, I say! Eras*mus!* Oh, Miss Pinkard!" The serenade continues at random all day long, and is familiar to every one who has lived within gunshot of the "hollering woman."

BEAUX OF FORMER TIMES.

WE much question whether the celebrated Beau Brummel, and even the equally celebrated Romeo Coates, are not absolutely mere Quakers in their dress, compared with some of the distinguished dressers of the former days. Sir Walter Raleigh wore a white satin pinked vest, close sleeved to the wrist; over the body a brown doublet, finely flowered and embroidered with pearl. In the feather of his hat a large ruby, and a pearl-drop at the bottom of the sprig, in place of a button; his trunk of breeches, with his stockings and ribbon garters, fringed at the end, all white; and buff shoes with white ribbon. On great court days his shoes were so gorgeously covered with precious stones as to have exceeded the value of £6,600, and he had a suit of armor of solid silver, with sword and belt blazing with diamonds, rubies and pearls.

King James's favorite, the Duke of Buckingham, could afford to have his diamonds tacked so loosely on that when he chose to shake off a few on the ground he obtained all the fame he desired from the pickers-up, for our duke never condescended to accept what he himself had dropped. His cloaks were trimmed with great diamond buttons, and he wore diamond hat bands, cockades and ear rings, yoked with great ropes and knots of pearls. He had twenty-seven suits of clothes made, the richest that embroidery, lace, silk, velvet, silver, gold and gems could contribute, one of which was a white uncut velvet, set all over, both suit and cloak, with diamonds valued at fourscore thousand pounds, besides a great feather stuck all over with diamonds, as were also his sword, girdle, hat and spurs. When the difference in the value of money is considered, the sums thus ridiculously squandered in dress must have been prodigious.

HOW THE SERPENT GOT OVER EVE.

THIS is a Frenchman's account of the temptation and fall of our mother Eve:—M. Adam—he wake up—he see one belle demoiselle asleep in ze garden. Voila de la chance! Here is something interesting. "Bonjour, Madame Iv!" Madame Iv, she awake! she hol' her fan before her face. Adam put up his eyeglass to admire the tableau; zey made one promenade. Madame Iv she feel hungry; she see appel in ze arbre. Monsieur le Serpent se promene sur l'arbre; make one walk on ze tree. "M. le Serpent," say Iv, "will you not have ze bonte to peek some appel? J'ai faim." "Certainement, Madame," zay ze serpent, "charme de vous voir." "Hola, mon ami, ar'r' retezvous!" cry Adam—slop. "Songez a descendre; what madness is zees? You must not peek ze appel!" Ze snak in ze tree, he smile, he took one pinch snuff, he say, "Ah! Monsieur Adam, do you not know zere is nossing prohcebeet for ze ladies? Madame Iv permeat me to offare you some of zis fruit defendu." Iv she make one courtesy; ze snak he fill her whole parasol wiz appel; he say, "Eef M. Adam will eat ze appel he will become like one Dieu—know ze good and know ze evil; but you, madame, could not become more of one goddess than you are now." And zis feenish Madame Iv.

LOVE FATAL TO FRIENDSHIP.

AT the best, love is fatal to friendship; the most that friendship can do is to listen to love's talk of itself and be the confidant of its rapturous joys, its transports of despair. The lover fancies himself all the fonder of his friend, because of his passion for his mistress, but, in reality, he has no longer any need of his old comrade. They cannot talk sanely and frankly together any more—there is something now that they cannot share, even if the lover desires to maintain the old affectionate relation, the mistress could not suffer it. This specire of friendship is sometimes invited to ruin the home of the lovers after marriage; but when their happiness has been flaunted in its face, when it has been shown the new house, the new china, the new carpets, the new garden, it is tacitly expressed and is not always called back again, except to show the new baby. The young spouses are ever so willing to have the poor ghost remain; the wife learns whether it takes two or three lumps of sugar in its tea; the husband bids it smoke anywhere it likes, and the wife smiles a menacing aquiescence; but, all the same, they turn it out-of-doors. They praise it when it is gone, and they feel so much more comfortable to be alone.—W. D. HOWELL, *in Private Theatricals.*

WOMAN'S WORK IN THE EAST.

THE Witness of Lucknow, India, speaking of the Zenana workers, says:—"There are now in India at least 104 of these earnest and devoted ladies, doing a work which no others can do, and which, with the blessing of God, must surely result in bettering the condition of the too-often unhappy inmates of the zenana; and to this number must be added at least as many who have been raised up in the country, and who in earnestness, devotion and success vie with their sisters from Great Britain and America." It is but a few years since access was gained to the zenana, the homes of the women, and this is now one of the most efficient and important of the agencies employed in promoting the spread of the gospel in that country. The mothers of any land must be educated and converted to Christ, or the people can never be won.

FOR AND ABOUT WOMEN.

THE young lady who called at a bookstore for "Drake on Attachments," was disappointed to find it a mere law book.

AN English lady recently said to Mr. Pierrepont, who takes so much pride in his beard, that although he may make a very poor ambassador, he would make a very beautiful goat.

A SCIENTIFIC writer says every infant can say "no" several months before it can say "yes." An old bachelor who has been rejected seventeen times says this habit of saying "no" before she can say "yes" clings to the female infant until she becomes twenty-seven years old.

THE papers are just now telling of a tough and spirited Indiana woman, who is in the publishing business, and who has taken her husband into partnership. Let her be encouraged. These women that give a man a chance ought not to be crowded out.—*Louisville Courier-Journal.*

GEORGE ELIOT says that a young man's eyes first open to the world when he is in love. This is not always so. Usually it is when he has gone away from home and had his washing sent out for the first time, and finds among it, when it is returned, an odd stocking with two red stripes about the top and long enough to pull up around his neck.—*Norwich Bulletin.*

THE life of a Turkish woman is vapid and meaningless; she is as ignorant as a child—yet even the grand vizierate is often at the disposal of harem intrigue. And if we would discover the kanker which lies at the root of Turkish society, we must seek it in the practice which condemns the children of both sexes to the vicious atmosphere of the harem during the most plastic years of life.—*Fraser's.*

NEAR Carrollton, Ill., the people are much excited over a very remarkable double wedding. The son and daughter of Richard Wiles, both under twenty, visited for the first time the son and daughter of Dr. Travis, living in the edge of Morgan County. The two couples became almost immediately struck with "love at first sight," and a double wedding was proposed. This romantic idea was carried out, and the four straightway became two.

Reading for the Young.

THE SEED.

THE farmer planted a seed—
A little dry, black seed;
And off he went to other work—
For the farmer was never known to shirk,
And cared for what he had need.

The night came with its dew—
The cool and silent dew;
The dawn came, and the day,
And the farmer worked away
At labors not a few.

Home from his work one day—
One glowing summer day—
His children showed him a perfect flower;
Had it burst in bloom that very hour?
I cannot say.

But I know if the smallest seed
In the soil of love be cast,
Both day and night will do their part;
And the sower who works with a trusting heart
Will find the flower at last.

MISCHIEVOUS CHILDREN.

BY MRS. ANNA ST. CLAIR.

COMMEND me to mischievous children! A child that has much life, has generally a good deal of mischief in its composition, and the wise mother will not lament over this propensity, but use it in the development of character. It is not agreeable to have the work basket capsized to make a chariot for the cat, nor one's summer hat immersed in the wash bowl, because water is considered necessary to its roses, but it is better than having a child who is incapable of improvising a new toy, or of originating a new method of refreshing artificial flowers. We often consider the action of a child absurd, which, if we were acquainted with the processes by which his conclusions were arrived at, would appear quite reasonable. The child's mistakes arise generally from ignorance rather than from any want of common sense. If a child knows that natural flowers are kept fresh by being plunged into water, he is not to blame if he does not know that the same rule will not apply to artificial flowers; he does not act as a monkey does, simply from the desire to imitate others, but from a deduction intelligently made, though from false premises. The active mind, with its quick perceptions, finds itself in a world full of wonderful things, presenting new mysteries every hour; is it remarkable that it often attempts their solution by rather singular methods? The cure for what is called a love of mischief is employment for the mind. Toys are far from being what short sighted people are apt to suppose—mere amusement; they are education, and should be so used.

Toys may be divided into two kinds: those made to be looked at, and those made to be used. The first are generally the plague of both parent and child, and inevitably come to grief after a short holiday existence, which has little use or pleasure beyond the impression of novelty. But those of the second class are the means of an education, which no one interested in the child's welfare should neglect. To it belong the house-keeping toys of girls, and all the instructive ones, which are equally acceptable to boys and girls, such as blocks, dissected pictures and maps, architectural toys, etc., etc. Equally useful are the collections of admirably executed animals, in wood carving and in molding, which make the child acquainted with the different forms of animal life, and excite its curiosity with regard to their habits. To children of active imagination and subtle fancy, their toys become sentient things. They live and love and hate; and a doll, a wooden dog, a horse, become objects of affection as true and real as that which they feel for brother or sister. I have seen a little girl sob and cry for a dilapidated rag baby, and refuse to be comforted by a French beauty, just from Paris, whom she regarded as a stranger.

But the toys which are made for their use are not, by any means, of as much benefit to a child as those which they make for themselves, and it is in the indulgence of their love of construction very often that mischievous urchins bring themselves into disgrace with the powers that be. Nothing, therefore, can be better for all concerned than to supply the means of innocently indulging this invaluable faculty. Let the little ones have paper and paste, paints and brushes, all manner of scraps, and that variety of odds and ends which the housemaid condemns under the general name of "trash," but which have to them all the charms of *treasure trove*, and let them have a place where "litter" is not tabooed, and where all manner of incomplete kites and wagons, incipient balloons and impossible men and women shall have undisturbed possession. No doubt, to tidy women "litter" and "trash" are trials, but mothers can avoid much of that sort of annoyance by assigning definite limits to the arena of experiment, and compelling submission to the reign of law, outside of those limits; but to put a stop to philosophic experiment for the sake of a tidy house, is to insure the defeat of the only end of a tidy house, namely, the comfort of its inmates—for mischief, like murder, will out, and the result will be that the experiments will be made, not within the safe bounds of the playroom, but with more costly things in mamma's chamber or the drawing room. Mischief is only perverted activity of brain and limbs. Direct such activity, by giving it wise and safe employment, and child and mother will find the benefit in the unbroken sunshine which comes to those homes where children are a joy and not a cross.

NELL'S LESSON IN VOCALIZATION.

SCENE:—Croquet ground; NELL, with mallet in hand, and small, slipper-encased foot upon FRED'S ball, ready to send it "out of her way;" FRED, a sophomore, clothed in dignity, precision and a silk hat; SAMUEL, a divinity student, and SARAH, his adversary (at croquet), only a farmer's daughter.

"Pig! Pig! Pig!" came in a shrill treble across the adjoining stubble field.

"That woman does not appreciate her privileges," exclaimed NELL. "Those pigs will no heed that call; they think, if they think at all that she is calling one of her children."

"How should she call?" asked FRED.

"Pig! Pig! Pig!" rose NELL'S voice, sweet and clear, though in exact imitation of the farmer's who owned the pigs. The sophomore looked at her in amazement; the divinity student clapped his hands and cried, "Bravo!" while the animals in question came galloping across the field uttering their characteristic "Bush! Bush!"

"Yes," continued NELL, her bright eyes as full of enthusiasm as though she were making a stump speech in the Presidential campaign, "this is one of woman's inalienable rights—always to make her call an effectual one, whether it be to man or brutes; that woman dare not call only in her high soprano, lest she be thought unwomanly; let her always speak in low, sweet tones, calm and even, to her children, but when she calls her pigs or her cows, let her ascend or descend the musical scale, until she finds a chord to whose vibration they shall respond; and if her dog will not come without a whistle, then let her whistle; she can do all this and yet retain her womanly dignity. A woman's words and tones should be full of meaning; but Oh! 'Frivolity thy name is woman!'"

With a sigh NELL concluded her lesson; the mallet did its duty, and sent FRED'S ball where it bid fair to make a "booby" of him.

KENNETH DUNN.

CHAT WITH A MOSQUITO.

BY C. H. C.

UGH! what's that? What woke me up? Some music—something singing! Something *stinging*, too! Oh, it's *you*, wretch! How dare you light on my cheek when I was asleep and suck my blood, vampire! If I could get at you, I'd give you a cuff on the side of the head that would send you to Jericho in short meter. There, take that! Didn't I? well, take *that*, then! Pshaw! I didn't again——a-h-h-h!

Oh, I see you sittin' there on the bed-post! You think yourself as big as an elephant, don't you? You look something like one, too, with your proboscis. Got a trunk, too, have you, traveler! I'd like to see you travel, spindleshanks! Your trunk is like your noddle—empty! How brave you are with *my* blood in your dirty little carcass! Let me tell you, pest! that 'tis good blood—'tis the blood of kings—aye, and of queens, too. If you don't believe me I'll show you my genealogical tree—and lend you my specs to examine it with, goggle-eyes!

Oh, you're talking, now, are you? What's that you say? "I've got too much cheek!" Should think I had, after what you did to me. It's swelled as big as a pound apple. I'm poisoned, you wretch! Camfire! where's the camfire?

POMPEII.

THE annals of the world supply, in the way of antiquarian research, nothing more wonderful and strikingly affecting than the discovery of this long-buried city, above which, year by year and century after century, the yellow corn has waved in the soft southern winds, and the vine put forth the purple grape. And in speaking of Pompeii the neighboring cities of Herculaneum and Stabiæ must not be forgotten, though originally places of far less importance, and, from the discoveries which have been made, presenting few features of interest compared with the first-mentioned. Older places than either of these have been traced out and made tolerably familiar to us by the traveler and artist, but very partially, and chiefly by their architectural remains only; when, however, the superincumbent weight which had so long pressed down the cities of the Italian plain was by slow degrees lifted, there was revealed to the living the life of a world which had existed nearly seventeen hundred years earlier, in its public and domestic aspects—revealed, too, with a vividness sometimes as appalling in its reality as it was interesting for its historic value. A marvelous chapter, in the annals of Roman life in the first century of the Christian era, is that we read in the story of the exhumation of Pompeii, and of which so much is to be seen in the museum of Naples. The subject has filled a conspicuous place in the literature of Europe during the century or longer, as fresh discoveries have been made from time to time.

SEVEN "MINDS."

1. MIND your tongue! Don't let it speak hasty, cruel, unkind, or wicke words. Mind!

2. Mind your eyes! Don't permit them to look on wicked books, pictures, or subjects. Mind!

3. Mind your ears! Don't suffer them to listen to wicked speeches, songs, or words. Mind!

4. Mind your lips! Don't let tobacco foul them. Don't let strong drink pass them. Don't let the food of the glutton enter between them. Mind!

5. Mind your hands! Don't let them steal or fight, or write any evil words. Mind!

6. Mind your feet! Don't let them walk in the steps of the wicked. Mind!

7. Mind your heart! Don't let the love of sin dwell in it. Don't give it to Satan, but ask Jesus to make it His throne. Mind!

LETTERS FROM BOYS AND GIRLS.

From a Georgia Girl.

DEAR COUSINS:—I am one of the RURAL readers, and I am very much interested in it. I see some of the girls have been writing about their flowers. I am very much interested in flowers, but I do not try to raise very many, for, as Cousin CORA said, the hens scratch them up. I have a Madeira vine, and it is growing very nicely. I will be very thankful to some of the Cousins if they will tell me, through the RURAL, how to keep the vine through winter. I will change the subject and tell you about my quilts. I am piecing two: one is call the "dogwood blossom," and the other the "bachelor." I think they are pretty. My mother has pieced one called the "broken stove." It is very pretty. I must tell you, before I close, that I am going to try to get up a club for the RURAL. I am very much interested in Uncle TRUE'S letters to us young folks.—MAMIE A. S., *Spaulding Co., Ga.*

[UNCLE TRUE begs to say that he will publish a "General Order" very shortly, which will create a great excitement in the RURAL Legion, and make the coming campaign a rousing one. Look out for it.]

An Offer.

DEAR MR. EDITOR:—I have never written to the RURAL before, and do not know as I will make very good headway; but I thought that if all the rest of the boys and girls were writing I would try. "Try" ought to be every one's motto. I can do any work that is to be done on a farm, from feeding the pigs to getting in the crops and taking care of them. My father lives on a farm of a little over two hundred acres; he keeps five horses, fifteen cows, and a considerable young stock. He has taken the RURAL ever since it was started. I have become very much interested in the boys' and girls' letters. If Cousin JIM will write again and sign his right initials, I shall be very happy, and in return I will send mine. A great many of my schoolmates call me "Captain." I suppose it is because I am captain of a base ball club. Yours truly—CAPTAIN.

A Utility Girl.

DEAR COUSINS:—I would like to become one of your number. I am like Cousin JIM: I never wrote to the paper before. I live in Tennessee, on the mountain. I am fourteen, and am five feet four and a-half inches tall. I can milk, harness a horse, plow and drive oxen. I can spin and weave, and help run the saw mill when I am needed, and run the grist mill; I have done it many a time. I have not learned to shoot a gun, but my brother has promised me that I may go a deer driving with him some time.—WILD NELL, *Black Wolf, Tenn.*

From a Broome County Girl.

DEAR EDITOR:—I am ten years old. My father keeps a dairy of ten cows. We live on a farm of 180 acres, and in summer and autumn it is the loveliest place that you ever saw. I have got a pet cat and his name is Billy. Dear Cousins, more of you write, and let us have a whole column of RURAL Cousins. My name is—CLARA D.

The Puzzler.

DECAPITATIONS.

1. DECAPITATE a tree, and leave part of a circle.
2. A kind of stone and leave tardy.
3. A mollusk, and leave a metal pin.
4. A wild animal, and leave a domestic animal.
5. A round body, and leave the whole.
6. A plant, and leave a wooden frame.
7. Meager, and leave a relation.
8. A snob, and leave a fountain.
9. Part of a wagon, and leave part of the human body.
10. A transparent substance, and leave a maid.
11. A blaze, and leave a cripple.
12. A kink of nut, and leave a kind of grain.

☞ Answer in two weeks. C. S.

MISCELLANEOUS ENIGMA.

I AM composed of 18 letters:

My 7, 5, 15, 3, 6 capital of one of the States of our Union.

My 8, 14, 13, 1, 2 value.

My 16, 17, 11, 18 lazy.

My 12, 9, 4, 10 a dose of medicine.

My whole is a religious song.

☞ Answer in two weeks. LITTLE ONE.

PUZZLER ANSWERS.—Oct. 7.

MYTHOLOGICAL ENIGMA.—She wept herself into a stone through grief at the death of her children.

POLYSYLLABIC ANAGRAMS.—1, Polyhedron; 2, Polytheism; 3, Posteriority; 4, Pontifical; 5, Polygamy; 6, Politician; 7, Postdiluvian; 8, Unworkmanlike; 9, Unvarnished; 10, Unwillingness; 11, Uprightness; 12, Topographical.

RIDDLE.—An Egg.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.90 for the two, may select any two of the following-named plants and a paper of the seed of the Moluccella Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory or garden. Its growth is rapid—small plants attaining the hight of five feet during the summer months. In the fall it may be cut back to any desirable size and potted for the winter, when it will quickly recover its symmetry and resume its ever-blooming habit. Its quick and exceeding popularity is a sufficient guarantee of its merits.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is as yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class. It is difficult to select a more attractive plant than Marie Lemoine when freely blooming. Every truss is in itself a bouquet. The leaves are large, zoneless, vigorous. The plant is compact and, like *Abutilon Boule de Neige*, is invaluable, either for the conservatory, window or garden.

Hydrangea paniculata grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It has stood 26° below zero unharmed. It begins blooming in early August, continuing until after hard frosts. The thyrses of flowers, first greenish-white, then white, then rose, often measure a foot in length and twenty inches in circumference. Every stem being thus terminated, the striking appearance of an entire plant may be conceived. There can be no doubt that this is one of the most valuable of all perfectly hardy shrubs.

Variegated Ampelopsis or *Vitis heterophylla variegata*.—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green, much as *Abutilon Thomsoni* is variegated with green and yellow. From its racemes of flowers are formed fruit as large as currants, each one of which is a different color in shades of claret, azure-blue and green. These berries, which are first as soft as a currant, become finally as hard as bullets.

The pretty stems are also variegated, green, whitish and rose. The roots are perfectly hardy, and the vine's growth so rapid that it will cover twenty-five feet square in a season. For conservatory walls or pillars, for trellises or rockeries, it cannot fail to please. It has been growing in the RURAL EXPERIMENTAL GROUNDS for several years without the least protection.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the singular Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

News of the Week.

HOME NEWS PARAGRAPHS.

VIRGINIANS are now indulging largely in deer and sora hunting.

Tennessee is now sending about fifty emigrants per day into Texas.

A bevy of lively girls in Grant County, Ky., amuse themselves at night by stealing the hand cars on the railroad and working a furious passage up and down the track.

Popular meetings are being held in Nashville to devise means for the suppression of crime. Mayor Kershival is charged with being the friend and protector of gamblers.

A family of systematic murderers has been discovered at Montagne, Texas. Seven of them, well armed, are besieged by an incensed community, and will be starved out.

A shield bearing the coat-of-arms of the See of Cloyne, Ireland, which was Bishop Berkley's own diocese, is the design chosen for the Berkley window in the new Yale chapel.

The Indian Nation is the Gretna Green for fugitive lovers from Texas. Marriages in the Nation are valid.

The Alsea Reservation in Oregon has been abandoned, and is now thrown open to settlers. Many civilized Indians have located there.

Imitation Limburger cheese has been manufactured so successfully in Wisconsin that families living near the factory were obliged to close their windows.

Six prisoners set fire to and burned the Richmond, Texas, jail a few days ago. They were all nearly suffocated when taken out.

A San Francisco man lost his place as a barkeeper and had to go to work in a tea store; whereupon he became discouraged and killed himself.

A man at Fairview, Ky., with a craving for liquor, after selling everything of value wherewith to buy the stimulant, took his few months' old child and traded it over the bar for a drink of whisky. The child was afterward redeemed by the mother on paying for the liquor.

Judge Henderson of Lebanon County, Pa., at a late session of the Court of Quarter Sessions, issued an order forbidding the admission of boys into the court room during the trial of cases. He based the order upon the demoralizing effects of the narration of crime upon the young.

It has long been accepted as a fact that Capt. Mason was the founder of New Hampshire, but a document has just turned up which proves that David Thompson came over to New England and made a permanent settlement at the mouth of the Piscataqua river at least six years before Mason arrived.

Wednesday, Oct. 11, was the one hundredth anniversary of the battle of Valcour on Lake Champlain, one of the first naval engagements of the Revolution, in which Gen. Benedict Arnold's storeship, the Royal Savage, was sunk off the Island. The remains of the vessel are still visible at low water.

Since the passage of the ordinance making opium-smoking, in Virginia City, Nev., a misdemeanor, the smokers emigrate to Gold Hill nightly, and return to the city at all hours of the day.

The Hon. John W. Foster reports to the Department of Agriculture that "in Mexico there exists the agricultural capacity to produce all the coffee that can be consumed in the United States, and of a quality equal to the best grown in any country."

Remains of fourteen victims of the recent Indian raid near Frio City, Texas, have been found. Many think the raiders were white men in disguise.

A late Charleston circular puts the present rice crop of Georgia and South Carolina at 75,500 tierces or about five per cent. more than any crop since the war.

Five colored Methodist preachers raided a gin-house in Austin County, Texas, and attempted to carry off two bales of cotton; but the proprietor put in an appearance and shot three of the men.

During the progress of the Franklin county fair at Farmington, Me., a portion of the upper floor of the exhibition hall gave way, carrying 200 persons to the floor below. Several were seriously and one fatally injured.

On Tuesday morning, the 10th inst., the Peoples' Bank at Manchester, Mich., was entered by burglars, and over $9,000 in currency taken from its vaults.

Col. Merritt of the fifth Cavalry, with ten companies of his regiment and a battalion of three companies of the Second and Third Cavalry, comprising a total of eight hundred men, mounted upon new and most serviceable animals, left Camp Custer, D. T., Oct. 12, on a scout. The command will march in the lightest possible order, accompanied by a pack train carrying ten days' rations. Its movements and destination are kept a secret. It is understood that the forks of the Cheyenne river is the destination. There are several Indian villages in that vicinity. Col. Royall of the Third Cavalry remains in command of the infantry and retained cavalry. This demonstration will probably end the Black Hills and Yellowstone expedition, which will shortly march to Red Cloud.

FOREIGN NOTES.

THE new volume of poems upon which Victor Hugo is engaged is thus far purely literary in its character, not dealing with political questions. Several of the poems are satires.

An agricultural school is to be opened at Naito-Shinjuku, Tokio, China, the students of which are to be instructed by an American teacher.

Mlle. Waldmann, one of the finest contraltos of the age, was married at Milan, on September 5, to the Count de Ferrara, and as this leads to her retirement from the lyric stage, the lovers of music are grieving over the loss.

Mr. Ruskin, who is now in Venice hard at work, has been treated by the directors of the Academy with unusual courtesy. Large pictures were taken down from the walls and placed in a room where he could examine or sketch from them at leisure.

Every one carries arms in Sicily, not excepting priests. Gentleman carry a revolver in their pockets when they go to a ball or casino. Youths of fifteen are armed with it at the lectures in the Lyceum; law has no force—every one is a law to himself. The military are powerless against the thefts, assaults, and murders perpetrated in the open country.

The Czar Alexander receives, in round numbers, $25,000 a day income; the Turkish Sultan, $18,000; the Emperor of Austria, $10,000; the Emperor of Germany, $8,200; the King of Italy, $6,440; the Queen of England, $6,270; the King of the Belgians, $1,643; and the President of the French republic, $500.

Emperor William has addressed the following words to the citizens of Wissembourg, in Alsace, where the French first felt the shock of the advancing German host: "I know you come to me with bleeding hearts. It is only natural, my friends; but I myself have known vicissitudes, but bore up against them. Believe me, as an old man, time sets all things right. Time reconciles us to the greatest changes, and time, I am sure, will make you satisfied."

Dr. Abrath of Sunderland having by public placards invited attendance at a lecture on antimony, in which he proposed to perform experiments on living animals to demonstrate a theory respecting the Balham mystery, the Royal Society for the Prevention of Cruelty to Animals had him summoned and fined one shilling in vindication of the new Vivisection law, the sixth section of which renders a person amenable to punishment who advertises his intention to perform needless painful experiments on animals.

Marshal Bazaine is now residing with his wife and children at Llanes, a little village of the Asturias, where the Count de Mendoza Cortina has offered him hospitality. This gentleman is proprietor of the mines of St. Luis de Potosi in Mexico, and it is through him that the mother-in-law of the Marshal receives the revenue from her Mexican estates. Bazaine has no fortune, and that of his wife was completely absorbed by the expenses of his trial, which the French Government rigorously exacted, even to the extent of seizing a clock of the Marshal and a pair of his pantaloons to meet the balance due.

According to the Mandalay correspondent of a Rangoon paper, the King of Burmah has just contrived a wooden machine, which is to be erected in the palace, and by which the nether parts of the British Political Resident will be hidden altogether from the royal gaze. In this way will the Resident, with his shoes on, be allowed to approach and converse with his Majesty.

The Mohammedans of Bombay resolved at a largely attended mosque meeting to petition the Queen not to change her Eastern policy in a way tending to dismember the Turkish empire.

So great is the dissatisfaction with the British Prime Minister that upward of eighty Conservative members of Parliament (his own party) have sent him a round robin, asking that the country's demand for an autumn session of Parliament shall be acceded to by Government.

The Chinese Government thinks of establishing a mint. Full plans for mint operations and coinage laws have been submitted by the United States Minister.

An attempt by Chinese merchants to establish a line of steamers between Shanghai and Japanese ports has failed, and the enterprise has been abandoned.

The Pope has expressed a wish that he should not be addressed on the subject of religious toleration in Spain by the Spanish pilgrims who are about to visit Rome.

At the Brussels Hygienic Congress it was recommended that doctors and volunteer helpers should not be on the battle field, but in the second line, to render help to the wounded.

The amount of meat consumed annually per head in Spain is 25 pounds: in Italy, 33; Sweden, 54; Prussia, 56; Austria, 58; Belgium, 57; France, 73; South Germany, 77; Mecklenburg, 85; England, 205.

Interesting experiments are being made at the central telegraphic bureau in Paris with a new apparatus for producing a fac simile of the writing and signature of an individual sending a dispatch. The apparatus also produces, with great exactness, drawings of the most complicated description. The inventor is M. Lenoir. Some years ago similar trials were made with the invention of M. Caselli, but the results were imperfect.

It is proposed to carry a wire to the Cape of Good Hope across the African continent. Of the 1,500 miles or so of aerial line it is suggested that much might be erected without the expense of poles by taking advantage of the trees over thickly wooded tracts, which are frequent in tropical Africa. The difficulty would be to keep the natives from utilizing the wire in regions where iron is scarce and valuable, but this might be got over. The undertaking, if it could be established and kept in working order, would be exceedingly lucrative, and would in many ways aid in opening up Africa to commerce and civilization.

SEMI-BUSINESS PARAGRAPHS.

AMERICAN MANUFACTURERS ABROAD.—The Japanese Government, intending to introduce music in its European Schools, their foreign experts have selected Geo. Woods & Co.'s Boston made Parlor Organs, over all American and European instruments, as most thoroughly constructed and likely to withstand the climate.

FRANK MILLER'S LEATHER PRESERVATIVE and Water Proof Blacking received the highest and only award at the Centennial Exhibition.

THE RURAL NEW-YORKER wants good local agents. Address RURAL PUB. CO., 78 Duane St.

FRANK MILLER'S HARNESS OIL received the highest and only award at the Centennial Exhibiton.

INQUIRIES FOR ADVERTISERS.

[Owing to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents," so that each inquiry will appear under its appropriate head, either in "Inquiries for advertisers," or "Answers to Correspondents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers, and while we shall not hesitate to give our reasons for excluding bad or doubtful advertisements all such other matter will be admitted as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want and the want is indicative of its need.]

D. A. H., Natches, Miss., will find B. B. Red Games advertised in this paper by a good responsible party.

R. A. B., Dallas Co., Miss., wants a good steam engine of about 3-horse power for Dairy purposes.

H. M. G., Ashtabula Co., Ohio, wants to know which is the best 10-horse power thresher and separator. We cannot say all of the large machines advertised in the RURAL this season, are good and can be relied on to do what their manufacturers claim for them.

F. R. Y., Essex Co., Mass., wants to know where the "Wealthy" apple seed or trees can be obtained.

R. H. B., Oneida Co., N. Y., wants a Bussey Milk Cooler.

The numerous inquiries for good Portable Steam Engines, from 6-horse power up, is answered by the advertisement of WOOD, TABER & MORSE, on last page of this paper.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 14, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	90,546	Molasses	293
Whisky	2,593	Rice, bbls.	1,912
Corn meal, bbls.	850	Cut meats, pkgs.	10,002
Corn meal, bags	808	Lard, pkgs.	4,215
Wheat, bush.	675,808	Tobacco, hhds.	889
Corn, bush	657,769	do. pkgs.	4,325
Oats, bush	286,386	Butter, pkgs.	33,060
Rye, bush	108,944	Cheese, bxs.	40,315
Malt, bush.	67,512	Cotton, bales	28,307
Barley, bush.	179,551	Rosin	6,958
Beans, bbls.	8,008	Spts. turn., bbls.	1,136
Grass seed, bush.	13,574	Dried fruits, pkgs.	2,325
Beef, pkgs.	2,132	Eggs, bbls.	7,508
Wool, bales	1,475	Peanuts, bags	1,027
Hops, bales	2,697	Leather, sides	48,104
Pork, bbls	1,379	Sugar, hhds	—
Tallow	680	Oil cake	7,773

BEANS AND PEAS.—Exports beans past week, 691 bush.; since Jan. 1, 48,300 do.; same time last year, 24,446. There is a good jobbing demand for medium beans, which could be worked into a larger business if the supply was adequate and prices not lengthened. Marrows are not very active, shippers wanting a better grade than the old stock now supplied, and new are not plenty enough to fill round orders. New pea beans are in good demand. Old not wanted. White kidney are scarce and firm. Both old and new red kidneys bring good prices. Canadian peas looking up. Green peas have advanced, with some stock of new in market. B. E. peas quiet. Exports of peas past week, 10,280 bush. We quote:

Beans—New medium, $1.50@1.65; do. marrow, $2.15@2.25; do. pea, $1.65@1.70; white kidney, $215@2.225; red do., $1.85@1.90. Old Beans—Medium, prime, $1.40@1.45; other, $1.20@1.35; marrow, prime, $2.10@; other, $1.80@1.95; pea, prime, $1.50@1.55; other, $1.30@1.40; white kidney, prime, $2@3.10; other, $1.65@1.80; red do., prime, $1.70@1.80; other, $1.40@1.60; black, $3.25@3.40. Canadian peas, new, ₱ bbl., free, $1.10@1.12½; do. dn., bulk, 92@93c.; green do., new, $1.45@1.50; do., old, $1.35@1.40; S. B. E. peas (2-bush. bag), $2.25@2.35.

BEESWAX.—There is a supply, with the current demand, sufficient to give an unsettled range of prices, favoring the buyer. Quoted at 30½@31c. for Western; 31@32c. for Southern.

BROOM CORN.—Supplies are larger and prices unsettled. Quoted at 7@8c. for short green hurl, 6½@7½c. for green hurl, 5@6c. for medium green, and 3@4c. for red and red-tipped.

BUTTER.—Export of butter past week 3,986 packages. Receipts have fallen off to some degree still 33,000 packages is no small total compared with former seasons. Fancy pails and creamery show their old firmness, but it is difficult to make the outside rates for State half firkin tubs. The market has not been a brisk one. So few buyers remove entire dairies, the stock is given a large look. Early fall Welsh tubs are in good demand. When they are first-class they find much favor as a family package and the single package trade forms quite an item this and next month. English Shippers are doing comparatively nothing, and ordinary Western is very weak. A few lots of fine State Welsh have been taken for export but it is not likely the business will enlarge at the prices 26@27c. In fact the styles they select can be peddled out to better advantage. It is to be hoped that the undergrades of State will be released to those who can handle that style even if the present time of quotations has to be broken in their favor. There is a good deal of stock to come forward, and unsold medium should not be allowed to stagnate the better grades by its presence. The buyer looks upon a crowded cellar as something in his favor regardless of the qualities contained.

We quote:—Choice pails, 35@—c.; prime, 28@32c.; poor to good, 25@28c.; creamery pails, choice, 36@37c.; good, 34@35c.; sweet cream pails, 30@33c. State firkins, choice, 32@33c.; fair to good, 28@30c.; do. half firkin tubs, choice, 32@33c.; fair to prime, 25@30c.; do. Welsh tubs, choice, 32@33c.; other, 24@28c.; Inferior State, 16@20c.; Western creamery, choice, 31@35c.; other, 31@33c.; do. firkins, best, 21@22c.; other, 15@18c.; dairy tubs, choice, 24@26c.; other, 15@18c.; factory choice, 22@24c.; other, 15@18c.

State dairies quotable at 28@31c. with fall tubs. Welsh tubs, dairies, 25@30c.

CIDER.—Prices are unchanged. Casks quoted at 8c. ₱ gal., small pkgs., fresh 10@12c.

COTTON is coming in freely, while export demand is small and prices lower.

The latest quotations are:—October, 10 31-32c.; November, 11 1-16@11 3-32c.; December, 11 11-32@11 9-32c.; January, 11 7-16@11 15-32c.; February, 11 21-32c.; March, 11 27-32c.; April, 12 1-32c.; May, 12 7-32c.; June, 12 13-32c.; July, 12 9-16c.; August, 12 11-16@12¾c.

Quotations for spot cotton, based on American standard of classification

Strict ordinary	9 7-16	Middling	10¼

EGGS.—The market has been dull and sellers have had to shape sales to prevent a surplus. Latterly the market is stiffer and quotations are a shade in better favor especially for extra fresh near points and choice marks of Ohio and Canadian. Limed eggs move slowly, prices too close to fresh and the offering is early.

Near points, 27@27½c.; State and Penn., 25@25½c.; Western, prime, 24c.; do., other, 22½@23c.; Canadian, 22½@24c.

State limed, 20@21c.; Western, do., 18@20c.

ESSENTIAL OILS.—Peppermint—Western and State oil, offered freely at $2.25 ₱ lb. Small sales of spearmint the asking price, $2 ₱ lb. Sassafras in fair demand at 45c. The market generally feels the weight of a large supply, and prices continue in buyer's favor.

FLOUR.—Supplies have run larger and a falling off in export and home demand has led to a pressure to sell at lower prices.

Sales at $4.40@4.90 for poor to very choice superfine State; $5.15@5.20 for very common to fair extra do; $5.30@5.35 for good extra do.; $5.40@5.50 for fancy do., and $5.55@5.60 for fancy to very choice extra; $4.40@4.90 for superfine Michigan Indiana, Iowa, &c.; $5.15@5.25 for shipping extra do., the inside price for interior, and $5.30@5.50 for choice to very fancy extra do.; common to choice white wheat extras, $5.55@6.50; fancy do. $6.55@7.75; winter wheat, good to choice family $6.00@7.50; round-hoop Ohio, $5.15@5.25, and trade brands of do. at $5.30@6.75; St. Louis, $5.20@6.20 for common to fair extra, and $6.35@8.50 for good to very choice; Minnesota "straight" at $6.25@7.75, and patent at $7.25@9.50; unsound stock at from $3.10@5.00; city mill extra for West Indies at $6.00@6.10; do. English brands, $5.15@5.20; do. trade and family $6.50@8.50; No. 2 at $3.10@3.90. Corn meal—$2.75@3.10 for yellow Western, Jersey and Pennsylvania, $3.25@3.30 for Brandywine. Buckwheat Flour—$3.25@3.75 ₱ 100 lbs.

CHEESE.—Export trade has been very slow again this week. On strictly fancy September factories, which are in small supply, 13¾@13¾c. have been made, and ordered lots to 14c.; but anything under this at relatively low prices, and an accumulation of supplies. The feeling abroad seems to be to allow the stocks to work down before operating further, and the result is but few orders coming.

Fancy factory, 13¾@13¾c. for fancy September; 12@13c. for fine August; good and prime, 11@12c.; fair, 9¾@10¾c.; State farm dairy, fancy, 11¾@12½c.; good to prime, 10¾@11c.; fair and good, 9¾@10c. Western factory, good and prime, 11@12c; fair lots, 9¾@10¾c.; do. cheddar, choice, 12@12½c.; do. flat, choice, 12¼@12¾c. Exports past week, 21,196 boxes.

DRIED FRUITS.—Apples have more attention from shippers, and are steadier in price. Peeled peaches quiet; held as before. Blackberries without change and but little wanted. Pitted cherries are doing better.

Apples—State, sliced, 6¾@7½c.; do., quarters, 6¾@7c.; southern sliced, new, 6@7c.; choice do. 7¾@8c.; fancy, 9@10c.; do., new quarters, 4¾@6c. Blackberries, 8@8½c. Peeled peaches, new, nominally 12@15c.; unpeeled peaches, halves, 7@8c.; do. quarters, 6@7c. Plums at 12@13c. Raspberries, 25@27c. Cherries, 16@17c.

FRESH FRUITS.—Exports of apples, past week, 5,468 bbls. The export demand helps the apple trade, not much in prices but it decreases the large stock. Some good winter varieties are in market. Common apples are neglected, while prime are cheap. Pears are running poor in quality, the best having been largely selected. Quinces are not plenty. Grapes are in fair demand. Cranberries begin to move. Chestnuts have declined heavily. We quote:

Apples, chplgs, ₱ bbl., $1 75@2; mixed, $1.50@1.62; good open heads, $1@1.37; common, 50@75c. Pears—Duchess, $6@10; Sickel, $8@13; Virgalieu, $6@10; Vicars, 4@6; Eastern boxes, $4@5; California, do., $3.50@4.50 including White Doyenne, B. D'Anjou, Duchess and B. Clairgeau; Cooking, $3@4. Cranberries, reg. crates, $2.75@3.75; reg. bbls., $9@10. Grapes—Delaware, ₱ lb., 8@10c.; Catawba, 7@8c.; Isabella, 5@6c. Quinces, ₱ bbl., $8@10; do. Cal. boxes, $3.50. Chestnuts, ₱ bush. $2.50@2.75. Hickory nuts $1.75@2. Peanuts, Va., choice, $1.50@1.65; other $1.10@1.50.

GRAIN.—In wheat there is a much stronger business on export account and the outlook more favorable; prices are higher. Latest sales are of old ungraded spring at $1.13; new No. 2 Chicago spring, $1.12; winter red Western, $1.19@1.22; amber Western, $1.26@1.28; white Western, $1.23@1.31; No. Milwaukee spring, $1.23@1.24; No. 1 spring, $1.30@1.32. Rye at 71@73c. for Western, and 86@91c. for Jersey. State and Pennsylvania. Barley, six-rowed State, 80@87½c.; 92c. for No. 2 Chicago. Corn has a good export demand at firm prices; sales at 57@58c. for mixed Western and 57½@58c. for yellow. Oats are higher and strong, selling at 29@48c. for mixed Western and State, and 33@40c. for white do.

HAY AND STRAW.—Receipts have increased somewhat but demand is fair and prices well sustained.

Bale hay 60c. for shipping; 75c.@$1 for retail qualities; clover, 55@60c.; salt, do., 55@60c. Straw quoted at 75@80c. for long rye; 50@60c. for short rye, and 50@60c. for oat.

Exports per week 255 bales; since Jan. 1, 36,592 do.; same time last year, 32,798.

HIGHWINES selling at $1.03.

HONEY.—Supplies are increasing and the demand is small. We have seldom seen new white clover comb quoted so low. The remnant of old stock is a great hindrance this season. White Clover, 15@20c.; buckwheat, 10@11c. for comb in glass.

HOPS.—Exports for the week, 2,405 bales. The bulk of this business was done early in the week, the market since then having been but moderately active. Choice lots are very firm, but medium and under-grades are unsettled, being rather dull. A few of the early shipments to Germany brought satisfactory prices, yet exporters are, in most cases, disposed to await further developments abroad. We quote:

New Yorks, good to choice, new	35 to 38
New Yorks, low to fair, new	27 to 33
Eastern, new	27 to 33
Yearlings	10 to 20
Olds, all growths	4 to 8
California, new	35 to 38

POULTRY AND GAME.—There are regular arrivals of dressed, and we give a full line of quotations. Prime stock is in good demand. The receipts contain a good many rough lots, as is usual at the open of the season.

New Jersey turkeys, ₱ lb., 16@20c.. State, 14@18c.; Western, 13@17c. Chickens, dry-picked, 15@20c. N. J. fowls, 14@18c.. State, 13@15c.; Western, 12@14c. Ducks, N. J., 16@20c.; State, 14@18c.; Western, 14@17c.; common turkeys and fowls, 8@10c.

It does not take much live stock to depress the market. Prices are generally low, with coops coming from all sections. Turkeys, when of even size, sell readily, but at low figures. We quote:

Turkeys, N. J., 13@15c.; do. Western, 13@14c.; N. J. Fowls and chicks, 13@14c.; State and Penn., 12@13c.; Western, 11@12c.; Southern, 10@11c.; Roosters, 8@9c. Geese, N. J., ₱ pair, $1.75@2; Western, $1.50@1.62; Ducks, N. J., ₱ pair, 61@67c.; Western, 50@65c.

Grouse are scarce, but every other item is in good supply, and prices are easier. Quail arrive steadily. Wild ducks have declined. Venison is sufficient for the wants of trade.

Wild ducks, mallard, ₱ pair, 50@60c.; red-heads, 70@75c.; teal and other common game, 25@30c. Quail, ₱ doz., $2.50@2.75. Partridges, ₱ pair, 65@70c. Grouse, ₱ pair, $1.12; Hare, ₱ pair, 50@60c. Rabbits, 25@30c. Venison, whole, 11@@13c.; saddles, 17@19c.

PROVISIONS.—Hog products generally are depressed and dull. Mess pork quoted at $16.30 for spot, $16.40 for November, $15.65 for December. Bacon at 9½c. for long clear and 10c. for short clear. Lard, Western steam at $10.50 for spot; $10.10 for October; 9.87½ for November; $9.87½ for December and January. Stearine at $11½c. for prime Western. Tallow at 8¾c. for prime. Beef hams at $21 for choice Western. Beef quoted at $8@10 for plain mess, $10@11 for extra mess, $15.50@14 for packet. Tierced quoted nominal for prime and India mess. City extra India mess at 24 bid, and $25@20 asked.

SEED.—Timothy is active on export orders and higher; Sales at $2.10@2.15. Clover is scarce, quoted at 13½c. Rough flax quoted at $1.44.

TOBACCO.—Seedleaf is in active export demand and favors the sellers. Kentucky leaf dull and weak.

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.

Timothy seed, $2.00@2.50; clover, $7.00@8.00. Milfeed strong at $14 for shorts, $16 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 35c. ₱ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Oct. 11, 1876.

The tone of the cheese market this week is a little firmer than last week, and prices are a shade better. Between four and five hundred boxes of farm dairy cheese were delivered and sales were made at 11@12¾c., according to quality. Factories were well represented, the offerings amounting to upward of 10,000 boxes, about 6,000 of which changed hands. Sales were made at from 12¾@12¾c., with two or three "fancy lots" reported at 13c. The bulk of sales may be quoted at 13¼c., and amounts 3,500 boxes. Most of the cheese on the market this week is of September make, and is pronounced of very fine quality.

The delivery of butter this week is lighter than usual. Sales were made at from 26@30c., the greater part going at from 28@29c.

The weather is cool with light flurries of snow on the hills of Herkimer Co., but no facts of importance have occurred to injure grass.

We have advices from abroad to the 25th of September. Our London correspondent says: "Buyers look forward to arrivals of Cheese from America of September make, and are prepared for high prices as English cheese is scarce and dear. American extra, sells for 58@60s.; fine, 56@58s.; good 52@55's.; Common and low grades from 30s@50s. English cheddar sells for 50@56s.; Wiltshire, double, 56@72s.; Cheshire, medium, 58@64s.; fine, 78@80s.; Scotch, 60@66s.; Dutch cheese Edams, 51@56s.; Gundas 51s@58s.; Derby shape, 58@64s. ₱ cwt.

Butter of all sorts is easier with the exception of Canadian. The high price of Irish and Continental Butter tells on consumption. Oleomargarine sells well. We give prices as follows.

Clonmels, 146@150s.; Corks, 158; Dorsets, 160s.; Jersey, 126@130s.; Friesland, 136@140s.; Normandy, extra, 120@156s.; American and Canadian, 126@130s.; good 116@120s.; medium, 96@106s.

Oleomargarine or artificial butter sells for 96@112s. per cwt.

BEEVES.—Trade slow but firm on, Monday last, on a heavy run of unusually good quality cattle; prices were 6¾@11c. ₱ lb.; weights, 5@10 cwt. Only three car-loads remained unsold. Wednesday, trade firm; prices, 8@10c. ₱ lb. Thursday, sales few, on a light run, at 8@10¾c.; weights, 6¾@9¾ cwt. Friday, the markets closed firm at 8@10¾c.; weights, 6@9¾ cwt. From 55@57 lbs., net, has been allowed, with a few top quality steers on 58 lbs. to the cwt. Spanish herds, direct from the Plains, sold at 8¾@8¾c. ₱ lb.; do. part fed east of the great rivers, 8¾@8¾c; native steers, grass-fed, 7¾@9c.; do., part corn-fed, 9¾@10¾c. Bulls, rough quality, 8 cwt, live weight, ₱ head, 2¾@2¾c.; do., coarse but fat, weight, 1,300 lbs. ₱ head, 3¾@4c. ₱ lb. Dry cows, 7¾@8¾c. Oxen, rough quality, 8@8¾c.

MILCH COWS.—There has been a rather better trade in fresh cows, during the past week, than we have been able to report for some time past. Fair quality cows have been in fair demand at $55@75 ₱ head; extreme range of prices, $35@75 ₱ head; general sales, $45@65 ₱ head—calves always included.

VEALS AND CALVES.—Smooth quality veals scarce and very slow of sale, at 8@9½c.; coarse quality calves in slow demand, at 3@6½c.; also at $1@16 ₱ head. State calves sold at 4@6c.; Pennsylvania do. 3@3½c., also at 6c.; Jersey do., 6@7½c. State veals, 8@9½c.; Pennsylvania, 8@9c.; Jersey, 8¾@9¾c. Western yearling bulls, 4c. ₱ lb.

SHEEP AND LAMBS.—Trade opened fair on Monday but on a moderate run; the quality of the flocks being from coarse to good. Sheep sold at 4¾@6¾c. ₱ lb., being firm. Lambs advanced ¼c. and sold at 6¾@7½c. Wednesday, trade fair, sheep sold at 4@6¼c.; lambs, 5¾@6¾c. Thursday, sales were fair; sheep, 4@6¼c.; lambs, 7@7¾. Friday, the markets closed dull; sheep, 4@6¼c.; lambs, 6¾@7¼c. Ohio sheep sold at 5@6¼c.; Canada, 5¾@6c.; Michigan, 5¾@6c.; Kentucky, 5¾@5¾c.; Indiana, 5@6¾c. ₱ cwt.; Missouri, 4¾@7¾c. ₱ lb.; State, 4¾@4¾c. Jersey ewes, 5@5¼c. Pennsylvania, lambs, 6@6¼c.; State, 6¾@7¼c.; Canada, 5¾@7¾c.

HOGS.—One car load of Ohio hogs, weight 212 lbs. ₱ head, sold at $6.55 ₱ cwt. City dressed inactive at 7¾@9¼c.; general sales at 8@7c.—weights included.

HORSE MARKET.—City trade fair in inferior quality animals; high-price horses slow sale. Thirty-seven head poor quality light harness horses sold at $55@95 ₱ head; 42 do., $60@100; 50 ordinary quality do. $150@195; 19 pairs of family carriage horses, generally aged, sold at $225@500 ₱ pair; 3 course quality brougham horses at $272@325; 15 coarse quality heavy draft horses, $120@205 ₱ head.

BRET HARTE is in Baltimore.

THE farmer's best vest—harvest.

PARIS has 600 finger-nail doctors.

ANNA DICKINSON is in Cincinnati.

GEN. SCHENCK is about to write a book.

GEN. G. B. MCCLELLAN is in Cincinnati.

RAG gatherers manage to pick up a living.

MR. EUGENE SCHUYLER is a great linguist.

CHARLES FRANCIS ADAMS is worth $1,000,000.

EX-GOVERNOR HOFFMAN is at the Centennial.

THE French debt is held by 4,172,313 persons.

WHAT is the worst kind of an omen? To owe men.

A SON of a Gunn has been married in Massachusetts.

THE Lee monument fund now amounts to $25,000.

GRACE DARLING exhibited great sheroe-ism in saving life.

THE naming of days was a week invention of the almanac maker.

ALWAYS in debt when there is no necessity for it; the letter B.

AN occasion which speaks volumes—The Librarians' Conference.

THE Louisville Courier-Journal calls Sitting Bull "sedentary taurus."

THE first bale of cotton this season has finished arriving.—*N. O. Republican.*

MR. DEVILWATER, appropriately enough, keeps a liquor shop at Evanston, Ill.

A SIGN in Detroit reads:—"Wanted a young man to drive horses up stairs."

THE Sultan of Zanzibar is going to publish the diary of his journey to Europe.

AMERICA is shipping paper to England, and the Times calls it the best in the world.

A GOOD watch, in your wakeful moments, will always be on its guard against you.

A MAN can't travel into a woman's affections by getting on her train.—*Norr. Herald.*

REMEMBER the poor, and while you are about it remember that they need something.

MILWAUKEE is called the Cream City on account of the number of pumps in its streets.

WHY are circus horses such slow goers? Because they are taught 'orses (tortoises).

How is it that some people always do things by halves? Why, in-two-itively of course.

ST. LOUIS has a larger population than any other city with the same number of inhabitants.

INDIANS can't fight all the while. Some time is required for the great work of calling for rations.

A NYACK man got out of plaster and finished the sides of the parlor with thirteen pumpkin pies.

AN Illinois German, Zeher by name, was presented with five children in one year—threes and twos.

No preacher can expect to deliver a live sermon by making a skeleton of his thoughts before hand.

JOSEPH appears to have been the first man on record who had any experience in Egyptian bonds.

PROFESSOR HUXLEY'S three lectures proved a regular bone-anza. He received $1,600 for each of them.

MARTIN FARQUAR TUPPER, the proverbial philosopher, is coming to America this fall to give readings.

A QUACK doctor advertises confidingly, "People never cough after taking one bottle of my cough mixture."

AN Iowa judge says that a man may legally kiss his hired girl if he can swear he thought it was his wife.

AMONG others, General Hood has been invited to attend the unveiling of the McPherson statue at Washington.

"My son has earned a reputation for scholarship," said an old man; "but the worst of it is he cannot earn a living."

THE judge who is clothed with a little brief authority should bring a new suit in court before cold weather comes on.

JOSEPH HADDEM of Erie County, "shot eleven squirrels in four shots." It looks as if Joseph Haddem in close quarters.

KATE FIELD is also mad at Joaquin Miller. She says she can't respect a man who sleeps with his head at the foot of the bed.

MOSQUITOES still prevail, but it is noticed that they hum only revival airs and never buzz back when they are struck at now.

MR. ROBERT BUCHANAN, the poet, got about $750 in money out of his libel suit against the proprietor of the London Examiner.

PATTI JOSEPHS, the actress who fell from a window in Philadelphia and was killed, was a sister of the Rev. Dr. Lorimer of Boston.

TURKEY'S worst foes are her own religious fanatics. The fact is, the "Sick Man of Europe" is dying under Allah-pathic treatment.

THE young man who wrote and asked his girl to accept a "bucket" of flowers, became a little pale when she said she wooden ware it.

VICTOR HUGO mercilessly says:—"Should I never write another word, 12 volumes of my unpublished works could still be issued from the press."

A DEALER advertises "genuine Jersey cider" for sale. That will do for those who like it; but most persons want genuine apple cider.

AN Irishman at the Centennial inquired for the Irish art gallery. He had heard there was a picture there by his countryman, Mike Langelow.

MENDELSSOHN'S home at Leipsic has been completely restored, even to the broken plaster where the rolling pin missed his head and hit the wall.

"MARRIAGE is promotion," says George Eliot. In the eyes of such a reasoner a man with his third wife would doubtless pass for a Brigadier-General.

ENGLISH lawyers, taking example from their American brethren, are giving up the traditional gown and wigs and appearing in court in ordinary costume.

A WISCONSIN editor having written of a deceased gentleman that "sickness had impaired his health," a rival rejoined. "Yes; it often has that effect."

AND still the Postal Department has another idea in postal cards—something combining the beauty of an oil painting and the convenience of a shawl strap.

NORTHERN people who have met Wade Hampton socially have found him hearty, jolly, courteous and willing to fight any man who would invade American soil.

IT is humiliating to a young man who has been singing his sweetest songs in front of a house to be told by a policeman that the family have been absent for a week.

A RAILWAY porter at Hayworth Heath, England, committed suicide during a fit of delirium tremens, by swallowing nearly the whole of an eight-page newspaper. It choked him.

NEARLY every citizen here has told his wife that there is another man in town who closely resembles him, and who is frequently seen coming out of saloons.—*Rockland Courier.*

A NEW ORLEANS man announces in a circular that having returned from a scientific trip through Europe, he is now better prepared than ever for cleaning clothes and carpets.

A THRIFTY young Teuton, living on State street, was asked if he should attend the races. "I vaits dil Tursday," said he, "dil der free for all, den I bays notting."—*Springfield Union.*

THE American artist, Henry Bacon, meditates the establishment of a school of art for his countrywomen in Paris. His picture of Benjamin Franklin, in the Paris Salon, this year, was highly praised.

KING ALFONSO'S favorite diversions are riding and hunting. He is fond of English and French literary and historical works, and is often present at the drill of his soldiers before six o'clock in the morning.

IT is stated that sometime during the present year a party of one hundred Englishmen is coming over to this country on a grand fox hunt. "Ist! Ush!" Ark—the 'orn of the 'unter is 'card on the 'ill.

MRS. HARRIET BEECHER STOWE has an enormous collection of autographs in the 563,848 signatures appended to an anti-slavery appeal, including the names of nearly all the women of eminence in Great Britain.

A GUSHING but ungrammatical editor says: "We have received a basket of fine grapes from our friend——, for which he will please accept our compliments, some of which are nearly an inch in diameter.

PROF. HUXLEY explains that the technical term used in science to designate a horse is also used to designate an ass. It is well enough to remember this in case you should ever be called upon to prepare a classified list of American statesmen.

ISN'T it funny? The author of the hymn, "I would not live alway; I ask not to stay," stays like a good fellow, being eighty years of age, with plenty of appreciation still for the good things of the world. He is Dr. W. A. Muhlenberg of New York.

AN inquisitive young man visited a State prison in New York, and among his questions asked a girl the cause of her being in such a place. Her answer was that she "stole a watermill, and went back after the stream that turned the mill and was arrested." The young man left immediately.

"It is now supposed that Abraham was the original base ball player, as the Scriptures say that he pitched in the wilderness.—[Philadelphia Bulletin. True, and Moses, you remember, took A-run with him in the wilderness.—[Exchange. Beg their pardons, but Noah was the first "pitcher" (Gen. vi., 14).

AN editor is described as a man who is liable to grammatical blunders, typographical errors, and lapse of memory, and has twenty-five thousand people watching him tripping—a man of sorrow and acquainted with grief; poorly paid, poorly estimated, yet envied by some of the great men he has made.—*New Orleans Bulletin.*

Implements and Machinery.

Centennial Year of American Independence.

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you samples of the Celebrated Watches, manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION. Those Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, fine Ruby Jeweled, set in Chaton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

No good Farmer can afford to market dirty grain.
A moderate quality of grain, well cleaned, brings a better price than the nicest grade in dirty condition.
A. P. DICKEY, Racine, Wis.
H. W. MARCELLUS, Rochester, N. Y.,
Agent for Western New York.

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Report (Ill.) Journal.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

Bryan.—Sometimes invalids are more injured by exercise than benefited. Knowing how much stress is placed by hygienists upon exercise in the recovery or preservation of health, those who are recovering from sickness or who are in declining health are apt to overtax themselves in their eagerness for speedy improvement. One's strength, be it more or less, must ever be the guide of the amount of exercise calculated to strengthen the system or any one of its parts. Whenever exercise has been carried to exhaustion, we may be assured harm has been wrought, for the reason that a loss of nutrient deposition, instead of a gain, has been sustained.

Fatigue is Nature's warning to cease work, just as much as a burning hand is her warning to withdraw it from the burning substance. A convalescent person may walk half a mile with but the first sensation of fatigue and be benefited. Should he continue his walk another half mile, a decided loss of strength would probably be the consequence.

We may disregard the thousand warnings of nature which have been instituted to guide us in a manner the best adapted to secure our highest welfare—once, twice, thrice. But the penalty will just as inevitably follow as that the sun shines brightest in a cloudless sky, and in unerring proportion to the degree and number in which they have been disregarded.

Though we wander from the answer to the question asked, we may add that in one view of the above remarks may be found the cause why so many farmers' boys, instead of growing up ideals of physical vigor and form, become the gaunt, sallow-faced, round-backed, crooked-legged men who constitute so conspicuous a percentage of the farming population. Too often is the work of a man expected of half-grown boys; too often farm tasks entirely beyond their strength and the development of their bones and muscles, are assigned to boys from ten to fifteen years of age, who with but little interest or aim plod on until the dreary task is accomplished. The result is a premature maturity and a consequent weakening and dwarfing of the physical and vital powers which, effected before or during the period of adolescence, is fixed for the rest of their lives.

"He chooses best whose labor entertains
His vacant fancy most; the toil you hate
Fatigues you soon, and scarce improves your limbs."

H. H. B.—The small, bluish caterpillar marked with deep orange bands across the middle of each ring, the head and feet also orange color is the larva of a beautiful moth known as *Eudryas grata* and quite fully described on page 427 of Harris' Insects Injurious to Vegetation. It is sometimes quite abundant upon grape vines, doing considerable damage to the leaves. We do not know of any better way of getting rid of this pest than to pick off the caterpillars by hand and then kill them.

E. C. Sherwood's letter is received. Neither the county nor state is given, and we cannot make out the post-mark. Will be happy to comply with request when the above is made known.

W. G. E.—No; make it a rule of your life never to invest in any business or enterprise of which you know nothing, or, to put it in a gambler's phrase, "Never bet on another man's game."

Alonzo Sackett.—Can you or some of your many subscribers, through the columns of your valuable paper, tell the origin of common house flies, whether they are developed from a grub or maggot or whether they hatch from eggs layed by old flies; if so, where are the eggs deposited? By answering the above you will greatly oblige. ANS.—The eggs of the common house fly (*Musca domestica*) are deposited in old garbage, decayed heaps of vegetables and about barns and stables. From the eggs minute whitish worms emerge and feed upon the filth in which is their home for the time being. The grubs grow rapidly, and when mature, pass into what is termed the pupa stage, remaining in this two or three weeks, then come forth full-grown flies. Large numbers of the common house fly hibernate and remain alive all winter, and, therefore, ready to go on perpetuating and multiplying this species the following spring. If you desire to watch all the transformations of the house fly, it will be necessary to breed them in glass cases from which they cannot escape, as it is quite difficult to find their eggs.

Wild Fern.—Could you please tell me the name of this white flower? Also tell me if the name of this yellow one is Golden Rod. ANS.—Yes, it is Golden Rod (*Solidago*). The white is *Eupatorium aromaticum*'

R. Hells.—If you will read the articles in the RURAL upon Poultry, by Mr. H. H. Hales another correspondents, we think the information sought will be acquired. The profits to be derived from 100 hens depend so much upon circumstances that no man can determine that point except by actual experiments—keeping a strict account of receipts and expenses in every instance.

Dry Goods, &c.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

BETWEEN

NEW YORK AND CHICAGO

via Cleveland.

9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Wit and Humor.

HE BET IN HIS MIND.

A short time ago the fine steamer Lee, in making her trip from New Orleans, had her full complement of passengers. As they walked about listlessly, and were apparently annoyed, they listened willingly to a suggestion from an individual who owned a monte bank, that just to pass away time they should buck at monte. The dealer found a table handy and opened his bank. In a short time the most of the company were engaged in the game. After it had progressed a while, a rough-looking stranger, who was closely observing the game, handed to the dealer a $5 piece. The dealer, surprised, asked him why he had done so; when he was told that he (the stranger) had lost it fairly, as he had bet in his mind on the queen. After several deals the stranger gave the dealer $10, making a statement similar to the first; whereupon the banker pocketed the money, thinking that he had found a lunatic.

After a short time had elapsed, the passengers, startled by a most terrific yell, looked in wonder and alarm at the contortions of the stranger, who, jumping about the group, cried out at every jump:

"I've won! I've won! I've won it!"

"Won what?" asked the banker.

"Why, I've won $250! I bet in my mind on the cavier, and he won! Hand over the money."

As the banker had permitted him to lose when betting in his mind, he had to pay him the money. The stranger received the money, and also a request to be more audible in his bets.—*Vicksburg Herald.*

SPARKS AND SPLINTERS.

The Poultry Yard.

THE HONDURAS TURKEY.

THIS magnificent species of the Turkey is the *Meleagris ocellata* of naturalists, and is found wild in Honduras and other parts of Central America. It is doubtless closely allied to the Mexican Turkey (*M. Mexicana*) and our wild species (*M. Americana*), formerly so abundant in the Middle and Southern States. From whence came our domesticated breed of Turkeys is somewhat of a puzzle, but Prof. BAIRD supposes there must have been formerly another native species from which the tame Turkey descended. We must, however, leave this matter to be decided by our naturalists, as Thanksgiving dinners will be relished none the less if the origin of the Turkey should remain forever a mystery.

The accompanying portraits of the Honduras Turkey were taken from specimens in the gardens of the Zoological Society of London and engraved for the Illustrated London News.

Whether it will ever be possible to domesticate this species, is a question for future poultry breeders to determine, as we can only say at present that it has not been done. There is here, therefore, an interesting and unoccupied field for some enthusiastic poultry fancier to occupy. The difficulties in the way of domesticating any of the known wild species, is one of the strong arguments used by naturalists in sustaining their theory that our tame Turkey did not come from either of them, but is a distinct species. Doubtless if a hybrid or cross (whichever it might prove to be) between the domesticated Turkey and the wild birds could be obtained, some new and fine breeds would result. This Honduras Turkey is certainly a splendid bird, and we hope that our zoological societies will soon afford some enterprising poultry fancier an opportunity of experimenting in the direction we have named, even if no good should come from it.

TEGETMEIR, in his noted work on "Poultry," speaking of this species, says:—"We hardly need state that this lovely species, could it be but naturalized, would be a great ornament to our poultry yards."

PHEASANTS IN ENGLAND.

IN your paper of to-day I notice "About Pheasants," etc. In the fields of Great Britain I have seen them plenty, and they are used for game, as well as deer, hare, rabbits, and various birds. There the laws are so strict that there is more game than in our own country. Every person owning land has as much right to the game as to his grain, fruit, cattle or sheep, but when a person rents the land, he has no right to the game unless it is so stipulated, and must not interfere with it. In its season game is plentiful in the markets for sale. Deer are, in many places, plenty, and I have seen 1,000 to 2,000 together. In the season, those wanted, are fattened, and with the use of dogs, they soon become wild enough for hunting.

In June, at Chatworth, I saw the pheasants you speak of, a week or two old; they had been hatched under hens. These were then fastened in boxes and the chicks running in the fields, there being several hundred, taken care of by the gamekeeper, who gave his attention to them, he having a small house to stay in. As soon as the hen forsakes them, they are sent to the woods and fields to take care of themselves. Only the game-keeper looks to them as well as to the deer. In most of the hills and mountains of Scotland they have no trees and much heather, and the land is very valuable for sheep and game. The black-nose sheep are small, and almost as good as game for the table—indeed, I think they are very excellent. W. O. HICKOK.

Pittsburgh, Pa.

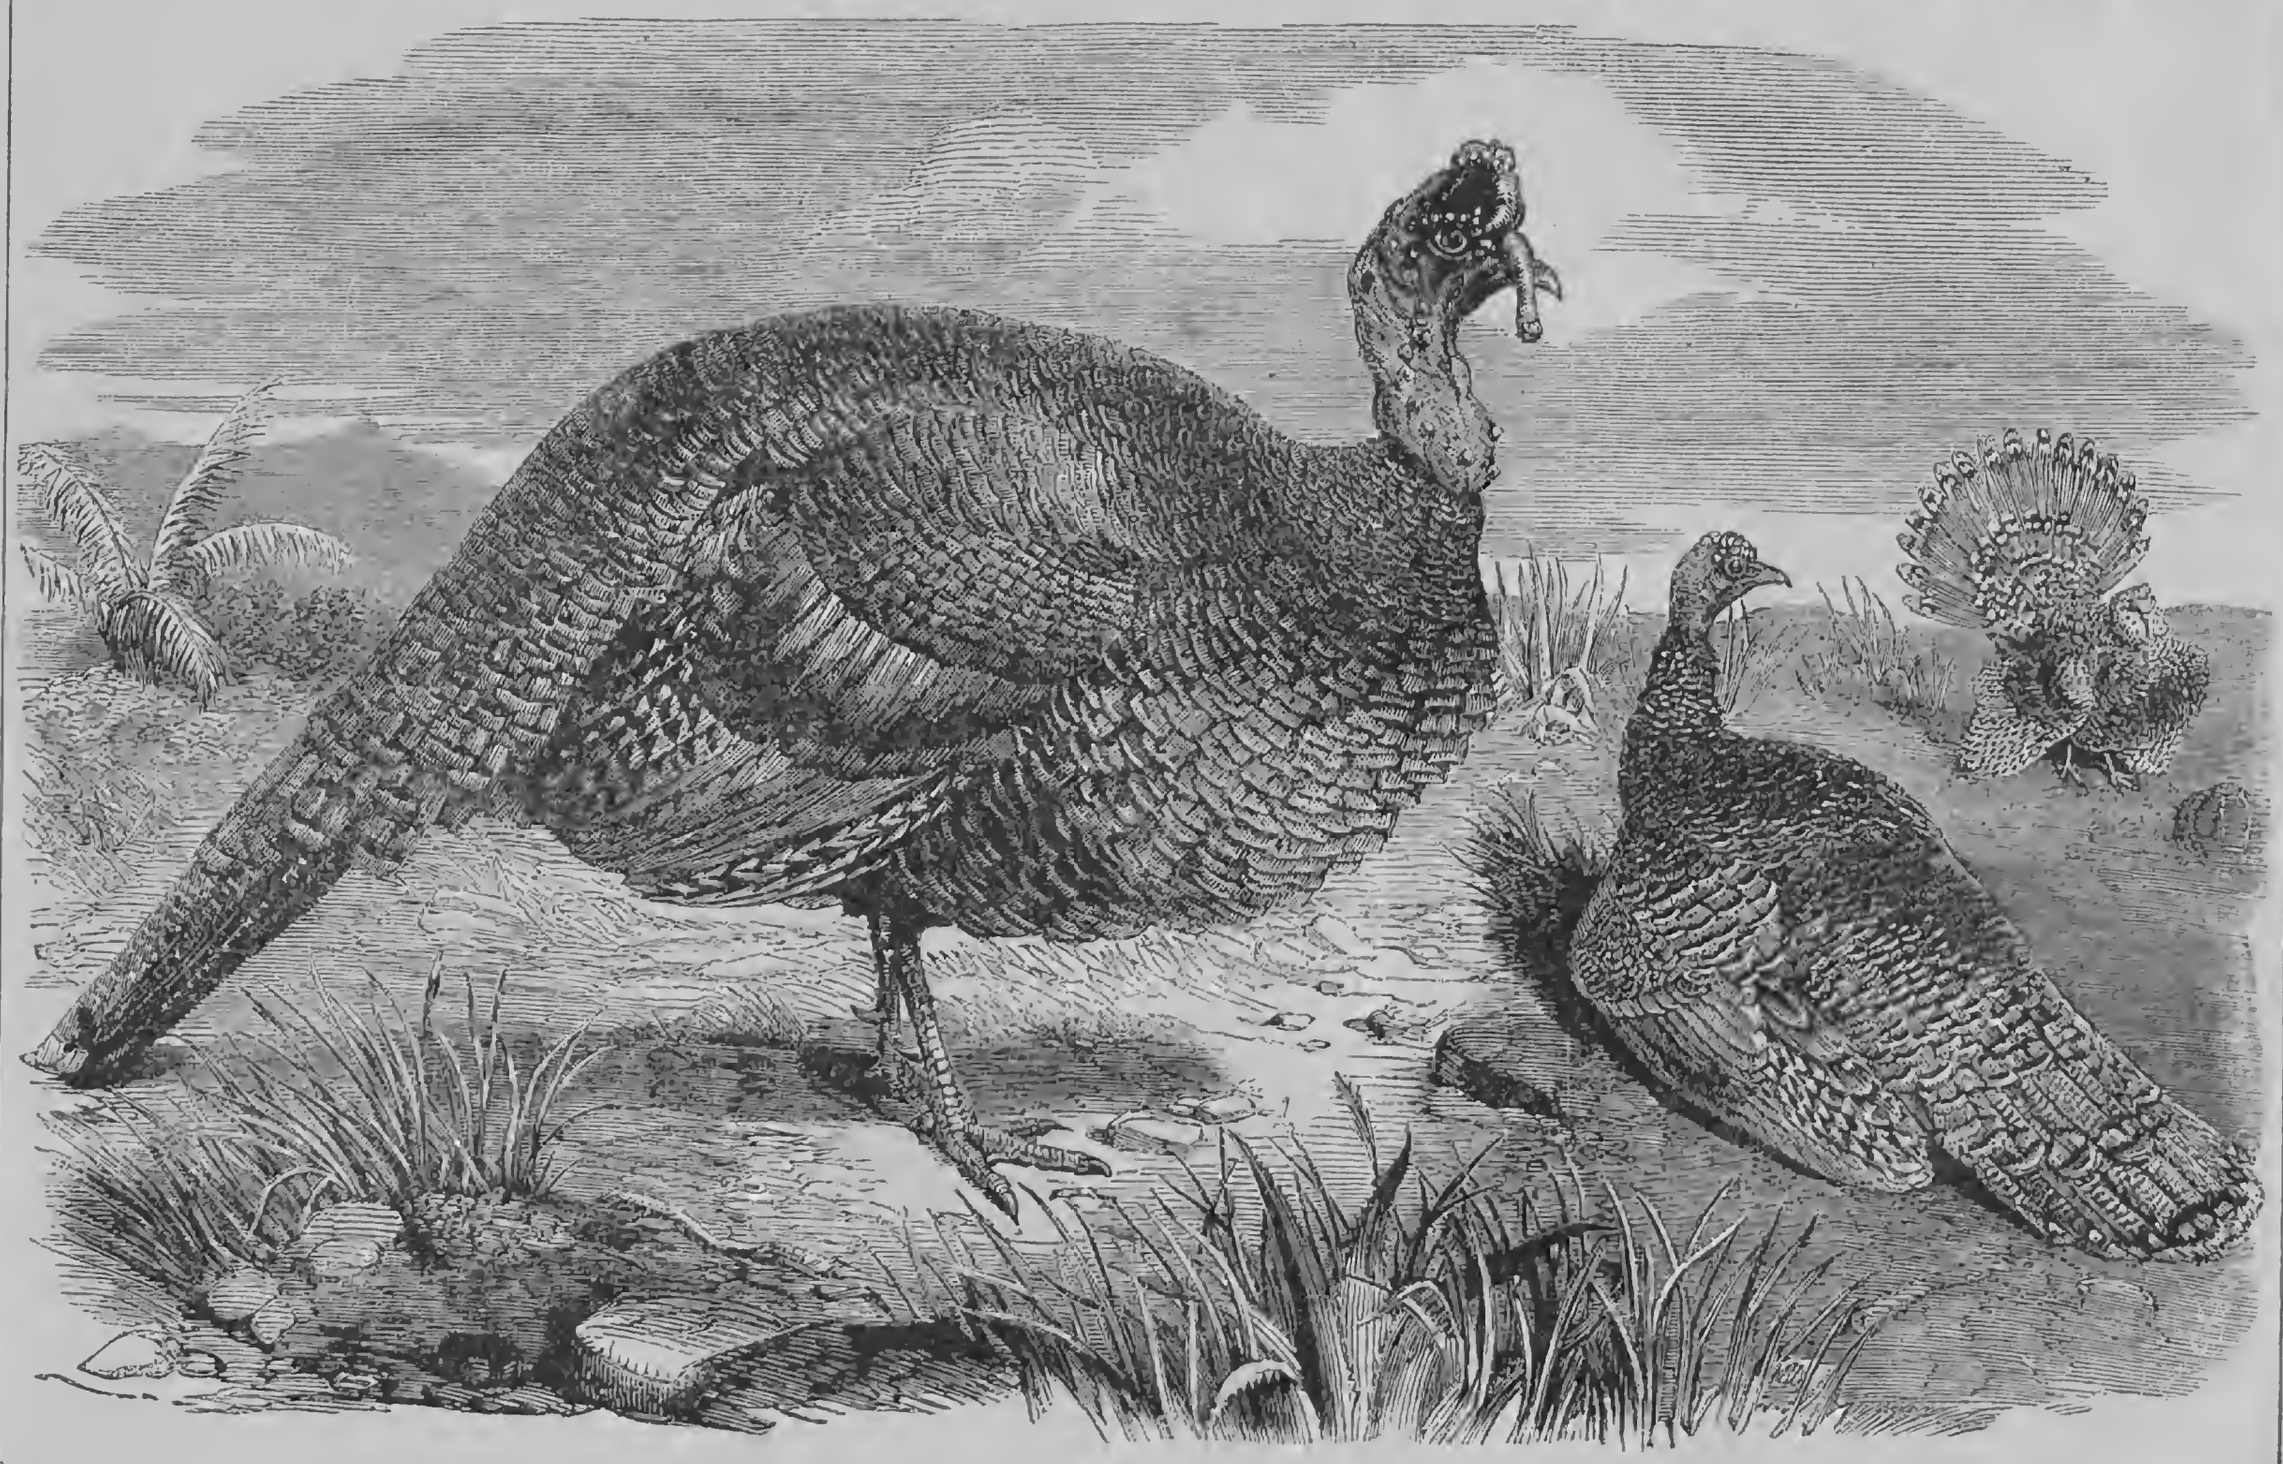
WHAT AILED THE DUCKS?

THE middle of July we had about thirty young ducks, seemingly strong and healthy. Then they began suddenly to sicken and die, one after another. We had been feeding wheat, and having run short, fed them on bread, potatoes and sour milk curd. When the first one died, we thought perhaps the sour milk did not agree with them. So changed the food to corn meal. But every day they grew less; finally we went back to feeding wheat. It was all the same. Death claimed the little quacks. The first apparent symptom was their being taken with "crazy spells." The victim would start to run forward a few steps, whirl round, try to balance itself, tip over backward, roll over and over until caught up, and then it would lose the use of its legs for awhile. At the end of five or ten minutes it would so far recover as to eat and drink, but would go by itself, and, after a while, grow stupid and blind, yet retain its appetite. Sometimes they would die almost immediately after being attacked, but usually lingered several days. The last of August I had nine left. Two recovered. Is there really any cure for sick fowls?

M. E. A.

[Will some of our readers please answer the above query.—ED. RURAL.]

DOMESTICATING QUAILS.—We see it stated in our exchanges that a man in California has succeeded in domesticating the California Quails by setting their eggs under hens. Fifty eggs were placed under a hen, from which 38 Quails were hatched, and all remained with their stepmother, showing no inclination to leave her. Tough!



HONDURAS TURKEYS.

The Herdsman.

IN PRAISE OF HEREFORDS.

I AM in receipt of the RURAL of Oct. 7, in which there is a report on the Live Stock Exhibition at the Centennial, which on the whole is a very fair one.

There is one point however, that does the Herefords injustice as a breed. Your reporter says: "Both Herefords and Devons fatten well; but neither of them put up in proportion the same amount of high-priced beef as can on equal quantity of fodder be accumulated by the Short-Horn family."

Now as regards the Herefords and Short-Horns the reverse of this is true. The Hereford for a given amount of feed will make larger returns than the Short-Horn. And for a given grass weight will give a larger per cent. of high-priced beef, and the high-priced beef of a richer, riper and better quality than the same cuts from a Short-Horn steer.

Mr. W. Probert of Cleveland, Ohio, who has been a butcher and market man for 25 years, was at my place two months since, and said he could afford to pay one to one and one-half cents more per pound live weight for a Hereford than he could for a Short-Horn steer, and make more on the Hereford than on the Short-Horn. This you will find verified by the experience of any butcher and market man that has cut Hereford steers.

The records of the Smithfield club, London, Eng., show the Herefords a long way on the lead of the Short-Horns as a beef steer, and the London market will show the Herefords at the same advantage as Mr. Probert would give them.

I am aware that the opinion prevails in this country that the Short-Horns are *par excellence*, the beef steer, but the record don't sustain them whereon they have come in competition with the Herefords.

I might say much more for the Herefords did I feel at liberty to trespass. In the very flattering notice you give of my herd, you say, of this herd "*Grace* and *Katie were bred in this country*." Of the 13 herd shown, 10 were of my own breeding. J. L. MILLER.

EPIZOOTIC.

This word is in common use and applied generally to a particular disease which has been occasionally prevalent in various parts of the country, but the Scientific Farmer truthfully says that there seems to be amongst the community an odd but wide-spread misapprehension regarding the significance of this word, "epizootic," so that it is now commonly considered to describe and define a certain disease amongst horses, whilst its real significance is entirely lost sight of; hardly a week passes that we are not asked to look at a horse which the owner thinks must have the "epizootic." It really denotes the prevalence of any one disease amongst animals, corresponding to an epidemic amongst people: thus there may be an epizootic of pleuro-pneumonia amongst cows, of cholera amongst hogs, of abortion amongst ewes, or of influenza amongst horses, just as there may be an epidemic of small pox, measles or scarlet fever amongst humans. The disease with which our horses have so generally been affected at two different periods within the past four years is, then, influenza or catarrhal fever and not "epizoot." As we are again approaching the fall of the year at which time this disease has heretofore made its general and remarkable appearances, a little about the histories of similar outbreaks in this and others countries and the general causes of influenza may not be uninteresting or inopportune. It has a very early history. In 1299 it appeared in Seville, where "it killed more than one thousand horses, and seemed to be inenrable." In 1648 it broke out amongst the horses of the French army in Germany. In 1588 it was prevalent over the whole of Europe, affecting both men and horses; in 1699 Europe and America suffered from the disease, and again in 1732; in 1767 it once more appeared in both hemispheres, when it is recorded that both horses and dogs suffered from it. "In 1776, after a very severe winter and warm summer, influenza spread over Europe, attacking horses and dogs first and human beings after. Poultry died in great numbers; it was very severe in New York and caused great mortality amongst the horses of Maryland." During the present century it has raged with varying degrees of virulence; in 1849-50 and 1863-4 and 1871-2 in London, and in 1872 3 in this country, when it broke out in Toronto, Canada, on Oct. 1, 1872. In 9 days it had attacked nearly all the horses in the city. On October 18th it reached Montreal; on the 14th, Buffalo; 17th, Rochester; 22d, Boston, New York, Brooklyn and Jersey City; 27th, Philadelphia; 28th, Washington; and again in October, 1875, there was an outbreak which, however, was much less intense and wide-spread than the one of '72 just referred to. It is singularly prevalent in some seasons, and although it will exhibit general characteristics in common, yet the epizootic of one year will be marked by some particular symptom or symptoms which will be entirely wanting in the outbreak of the following year. Horses of large cities and crowded towns are more obnoxious to it than those of the country: and in the country those are most liable to it that are the most confined. The attack is attended with great and early loss of strength and with early inflamation of the membrane lining the nose and throat, and the digestive organs are irritable.

Farm Economy.

FEEDING, CLEANING AND RESTING LAND.

AMONG the items in another paper, it was stated that English farmers were as careful of their land as any of the great breeders were of fancy stock, or rather more so, for they feed before the soil is hungry, clean before it is foul and rest it before it is tired. Thus the land must be in such high condition as to always grow good crops, which will account for tenants being able to pay the high rents, and numerous and heavy taxes without thinking it worth while to labor on the farm themselves. In the United States it is considered necessary for a man who owns the farm to work as hard, or rather harder than his men, while in England the tenant of any respectable farm would be deemed a mean and covetous fellow to thus take the place of a laborer and deprive a poor man of work, and the farm laborers despise a man of such a weak mind as to be unable to superintend and make ample returns without having to drudge and toil, to save the trifling wages of one man. Pshaw! What is the paying of two or three good men compared to what the mind can accomplish, when it is turned to feeding, cleaning and resting the land, the last of which is done when it is growing grass. Just as much is the soil rested, refreshed and put in a healthy state by lying in grass, as the poor worn-down horse is which may lie upon it.

There are poor farms in every country, but by having them occupied by men who have sense enough to understand the difference between plowing, cultivating and harvesting for 20 bushels an acre and doing the same for 40 bushels, and who can appreciate the advantages of grass which will feed double the stock, they will soon become productive and highly remunerating, and they will support not only the farmer and his family in affluence, but do good by adding to the general wealth of the country. See what this race of drudging and toiling farmers have brought this country to; the New England States are falling away in yield of crops, in numbers of animals and population in the agricultural districts. These driving hard-workers have not time to look after sheep and keep the dogs from them, or keep the fences good enough to prevent rambling; consequently the nation at large has to send gold to buy wool and cloth from other places, and not only is this a constant drain on the specie of the United States, but the whole of many districts are becoming less and less fruitful, whereas, if sheep abounded as they do in England the soil would be enriched so as to grow three or four-fold the produce it does now.

The advent of modern sheep husbandry was the salvation of British agriculture, for the consumption of turnips and swedes, by folding sheep over the land, exactly exemplifies what is stated of feeding the land before it is hungry, as the fields are heavily manured with all the dung in the yards and often with bone-dust or other artificial application as well, which forces an immense bulk of roots and with this the sheep are given hay and often oil-cake, or grain in addition to the hay, thus causing their droppings to be extraordinarily rich, which is feeding the land before it is hungry; then with the barley which usually follows turnips, grass-seed is sown which may be said to be resting the land before it is weary; and to illustrate the weeding before it is foul, it is the general custom to hoe between the drilled wheat succeeding the clover or rye grass, &c., which being done very early in spring, prior to the appearance of any weeds, can justly be said to be weeding the land before it is foul.

A Pennsylvania farmer, two or three years ago, grew an excellent crop of corn so heavy as to excite the unbelief of many, and a society sent a deputation to strictly investigate the facts which proved by measurement to be as stated. Then it will be remembered there were numberless inquiries respecting the previous treatment of this land when, to the disgust of all anti-sheep farmers, the proprietor stated it was all owing to his flock of 300 sheep which had grazed it for some time preceding the crop.

Now, in England, this crop would probably be all eaten by animals on the farm, and every other prodigious crop would have its equivalent returned in manure, thus continuing this wonderfully remunerating system and making all such farmers independent of the self-denials and hard labor deemed imperatively necessary in the United States.

Although close application, and a deal of industry in studying cause and effect, in looking forward so as to have the soil all the time in the richest condition is essential, yet, every manager of a good-sized farm should go around and find out for himself the prices of agricultural productions, whereby he can regulate supplies according to particular, local demands. For instance, when at a distance from markets, the cost of freight must be reckoned on all varieties of produce, for none but the greatest idiots would send corn or grain when, by turning it into meat, butter, or wool 50 per cent. could be saved. Then when close to a good market and where manure is cheap there are crops which would pay to send in rather than eat them at home. Hard working, drudging farmers are often mercilessly cheated by the middle-men who are between the producer and consumer.

A WORKING FARMER.

RENOVATING OLD PASTURES.

WILL you give us your opinion in regard to the practicability of harrowing pastures and sowing grass seed upon the sward, afterwards adding a moderate dressing of barn-yard manure. If this would be good husbandry, at what time should it be done.—A SUBSCRIBER, *Steuben Co., N. Y.*

WHETHER such a system of renovation as you propose would be better or more economical than plowing up and reseeding depends very much upon circumstances. If the land can be readily plowed and the owner can spare the pasture for a year or two, then we should say occupy it with some other kind of a crop, and then seed down in the usual way. But it is frequently the case that a farmer cannot conveniently spare his pasture for even one season, or the land may be of that kind which it is difficult to break up on account of stone, or a side-hill where the owner runs some risk in disturbing the sward for fear of the soil being washed away, and in all such cases the plan you propose is the best one.

We will give you our own experience in reseeding, without plowing, as a practical demonstration of results which may be obtained under like circumstances. Having a side-hill of rather light sandy loam which, when under cultivation, washes badly, we concluded that the only thing to be done with it was to seed down to grass. The first attempt was made a little over a year since, the grass-seed being sown alone, as is our general practice, but a very heavy rain following, large patches of the soil and seed were washed away, in fact but little of the seed was left to grow anywhere upon the hill-side, the greater part being carried down to the lower grounds. But having made up our mind not to plow that field again, it was left to take the chances of reseeding without it.

This fall so soon as the first September rains came on, we put on a sharp steel-toothed harrow which cut through the light sward and broke up the surface of the barren spots; timothy seed at the rate of a peck per acre being sown over the harrow by a hand following for the purpose. A few days later we gave the land a liberal dressing of ashes from burnt peat, brush and other rubbish gathered in clearing a piece of low-land. The result of this experiment is a fine thick-set growth of young grass over the entire side-hill and upon the level land so far as the harrow and seed sowing extended.

Later in the season, or when the ground freezes, we shall top-dress with barn-yard manure, and from present appearances the experiment is likely to prove a perfect success. It is perhaps rather late to sow grass seed with the expectation of its making much growth this fall, but if put in, and the land top-dressed with manure, it will come forward early and vigorously in the spring. Good husbandry is that which gives good results, the manner of performing any operation, being of far less importance.

A FARM FENCE.

A CORRESPONDENT of the Detroit Tribune gives the following information in regard to a cheap farm fence. He writes:—"I have to-day completed 100 rods of post and board fence, which I am so well satisfied with that I venture to tell your readers how I proceeded. It is rather an experiment with me but so far I am of the opinion that I shall erect all my fences on the same plan hereafter.

I should not have built this fence now if I had not been obliged to wait for the corn to harden sufficiently to enable me to crib it safely, and while waiting concluded to put up this strip of fence, which was put down for next spring. The late rains favored setting the posts by making the ground moist. I had secured split oak posts at a cost of ten cents, delivered. These were sharpened, and I calculate that the chips and hewings pay for this work. After the posts were sharpened and placed on the line of the proposed fence, stakes were set firmly on the line, fifty feet apart, and two lines drawn, one at the bottom and the other at the top of the posts. With a nine-feet measure we proceeded to lay off the places for the posts, sticking down pegs a foot long. With a sharp spade a hand followed and took off the sod, and also removed the earth one spade deep. I followed with an iron bar, round and sharp at the lower end, but enlarged upward until, fifteen inches from the point, it is four inches in diameter.

With this instrument a man may make the holes very rapidly. After making the holes for five or six rods we set the posts. A strong bench was made about the hight of a common table, having a cleat nailed to the legs on each side for a step. Armed with a beetle one man mounted this bench while the other held the post, and it was sent to its abiding place quicker than I can describe the operation. The driver dropped his beetle on to the bench, stepped to the ground, and in a twinkling he was ready at the next place. The posts are set in this way very rapidly and very firmly in the ground. After driving them the earth is replaced, or the space dug out with a spade and filled in with small stones, which is a better plan, and trampled firm. We then proceed to nail on the boards which are eighteen feet long. The first board is nailed on a foot from the ground, the second six inches above, the third ten inches above that, and the fourth twelve inches above the third. This makes a fence four feet four inches high. After the boards were all on, the posts were sawed off at the top of the last board, and two furrows on each side turned to the fence, which closes up the space below the bottom board. I cannot give you the exact cost of this fence, for it was put up at odd spells and by parts of days—in the way a good deal of the work on a farm is done; but I consider it a cheap fence and a good one. I prefer it to hedges."

WHAT CONSTITUTES A BARREL OF POTATOES.

THE American Grocer, in answer to a correspondent who asks the above question, gives the following reply, which is enough to make every honest man blush to own that it is "too true:"

In this market there is no legal standard, either of weight or measure, for potatoes or other produce. In Baltimore, Boston and Philadelphia, Irish potatoes are sold by the bushel of 60 pounds. This is the only true and honest way, and so great has become the abuse in this market that many of the best produce men here have voluntarily adopted this way of selling, but are obliged to buy from the grower by the barrel. Some years ago a number of produce dealers here, with others in Boston, Philadelphia and Baltimore, joined together, had a bill drawn up, making the standard flour barrel, which holds 200 pounds of flour, and 112 quarts dry measure the legal barrel. After two years' urging the matter at Albany and the expenditure of over $1,000 the bill was passed, but vetoed by the Governor, it is said, through the interference of the big barrel manufacturers in the upper part of this State. Barrels now are of all sizes and shapes and capacity, and any one can have them made to suit any purpose. The movement is to be started again during the next session of the Legislature, with every prospect of success. In Canada only the standard flour barrel is used. In Baltimore they have a standard barrel for potatoes, by which they are sold. Here, in Washington market, full weight and measure are enforced, and if any one buys a bushel, he gets just what he pays for, and if not, a complaint is likely to lose the stall-keeper his place. On the eastern shore of Virginia sweet potatoes are sold by the barrel of 150 pounds, and on the western shore, 62 pounds to the bushel.

TO KEEP SWEET POTATOES.

I HAVE found the following plan to be successful in Nebraska, says a correspondent of the Prairie Farmer. First dig your potatoes, and let them lie in the sun until they are dry. Second, have ready a pit sufficiently large to hold what potatoes you wish to keep over. Put in the bottom of the pit six inches of straw, and then put in your potatoes the same as you would pit Irish potatoes, and cover them lightly with straw, and let them stay three or four days, until they go through the "sweat;" then put on more straw and a light covering of dirt. As the weather gets colder, put on more cover—enough to keep them warm. I have kept my potatoes in that way for a number of years, and never failed. The potatoes should not be allowed to touch the earth. Keep straw and chaff tucked around the sides of the pit.

Dairy Husbandry.

DAIRY BOARDS OF TRADE — HOW ORGANIZED.

N. A. Willard, A. M.:—Will you give me information on establishing a Board of Trade for the sale of Butter and Cheese—how organized, by-laws, etc., and oblige—Geo. W. Hubbard, *Malone, Franklin Co., N. Y.*

Dairy Boards of Trade and market days for the sale of Butter and Cheese are easily organized. The plan is simply an agreement between buyer and seller to meet at some stated place regularly on an appointed day of each week for the transaction of business. The dairymen bring either their goods or samples of them to the market on the appointed days, and an examination of the same is made by the buyers, when bids are offered and sales made.

The usual plan of inaugurating a Dairy Board of Trade is for a half-dozen or more of well-known persons to unite in issuing a call for a meeting of dairymen, produce merchants and others interested in the movement on a certain day. The call may be printed in the local papers or posted in writing or in print at the post-office and other public places where it will be likely to be seen. Efforts also should be made to see factorymen and leading dairymen and have them attend the meeting and take an active part in the organization. When the meeting occurs pursuant to the call, a temporary Chairman is appointed and some one states the object of the meeting, or makes a motion that a Dairy Board of Trade be organized and that a committee of three or five to draw up a constitution or articles of association for such Board of Trade be appointed by the Chair. When these articles are presented, those present affix their names to the Constitution and then proceed to the election of officers. The articles of association need not be elaborate, and the briefer and simpler they can be drawn the better. We give below the articles of association of the "New York State Dairymen's Association and Board of Trade," which was the first or original Dairy Board of Trade in America, and which led to the formation of the numerous other Dairy Boards of Trade now scattered throughout the various States and in Canada. It is as follows:

I. We, the undersigned, do hereby associate ourselves together for the purpose of promoting the best interests of dairy farming, of cheese and butter manufacture, and the marketing of dairy products.

II. The officers of the Association shall consist of a President, twenty Vice-Presidents, a Secretary, Corresponding Secretary, Treasurer, and six Directors.

III. The President, Secretaries, Treasurer and Directors shall constitute the Executive Board of the Association, whose duty it shall be to prepare and establish a plan for the government and operations of the Association during each year, and who shall have control of the business.

IV. The officers of the Association shall be elected at the regular annual meeting and shall retain their offices for one year and until their successors are chosen.

V. The regular annual meeting shall occur at Little Falls, N. Y., on the third Monday of February of each year, at such place as the Board shall provide. Due public notice shall be given in such newspapers as the Executive Board shall designate for three weeks prior to the day of election.

VI. During summer and fall of each year regular meetings of the Association shall be held for the discussion and transaction of business at Little Falls at such time and place as the Executive Board shall indicate. One Winter Convention shall be had, commencing on the second Wednesday of December of each year, at such place in the State as shall be designated by the Executive Board.

VII. The Executive Board shall provide a convenient room in the Village of Little Falls, furniture and stationery for the transaction of business, and make suitable arrangements for telegraph reports of gold and produce markets on *market days*.

VIII. The Executive Board may appoint correspondents in other parts of the country and in Europe, who shall have the privilege of membership. It may also *provide for the settlement of differences between members by summary arbitration.*

IX. Any vacancies which may occur shall be filled during the unexpired term by the Executive Board.

X. Any person may become a member of the Association and be entitled to all its benefits by *signing the Articles of Association and by the payment of not less than one dollar a year*, or such greater sum as the Executive Board shall direct for each succeeding year, not exceeding five dollars.

XI. These Articles of Association may be amended at any annual meeting by a vote of two-thirds of the members present voting.

The above articles can be varied to suit those proposing to organize a Board of Trade, and at any time a set of rules may be drawn up to meet cases as may be required. There should be a register kept, and a bulletin board placed in some conspicuous position in the room for registering factories, sales, telegrams, or such other information as may be of interest. The sales day at the Little Falls Market is on Monday of each week.

Dairy Boards of Trade, wherever established, have been of great advantage to dairymen and a convenience to buyers. It is important that on the days appointed for the sale of goods the market be fully represented by dairymen or factory managers, with their goods or samples of the same, in order that buyers may not be disappointed in meeting with those who are prepared to make transactions.

MUTTON SHEEP IN CONNECTION WITH DAIRYING.

We are not in favor of pasturing sheep and cows together on dairy farms, at least when there is any considerable number of each class of animals to be kept. But when the cows and sheep have separate pastures, it may be advisable and profitable to keep sheep in connection with the dairy.

The first question that naturally occurs to the dairyman about to embark in sheep husbandry is, "What is the most profitable sheep for me to keep?" The answer to this question will depend somewhat upon the surface of the country, the soil, climate, and the markets where the farm is located. The sheep husbandry that may be most profitable at the West or Southwest may not be equally so in New York. Upon dairy farms in the Eastern and Middle States we must look beyond the mere production of wool to make sheep husbandry yield the best returns. There may be local causes affecting single farms that have an influence in determining what kind of sheep to employ, but as a general rule the East cannot compete successfully with the West and Southwest in producing fine wool, because the cheap lands of the prairies and the milder climate give an advantage in the cost of production which the Eastern farmer will find it hard to meet on his high-priced lands and long and rigorous winters. But when we combine meat and wool in our sheep husbandry, with a ready market close at hand and good prices for the meat, it must be evident an important element is added to the resources of the business.

In all the central counties of New York there is, and always will be, a good market for lambs and mutton, and there is nothing in the way of producing this meat to perfection. Of the different breeds of English sheep, the Cotswolds, the Lincolns, the Leicesters, and the Downs, each has its advocates, and each combines those qualities which render them profitable both for wool and mutton. But to grow wool and meat at a profit it is not imperative that entire reliance be placed upon pure-bred animals. If common, coarse-wool sheep of good size and constitution and with a tendency to heavy fleeces be selected, they may be crossed with a pure-bred male of either of the varieties named, and in this way a desirable flock may be obtained. By breeding in this way considerable expense is saved in the purchase of pure-bred animals, while the grades will do good service for meat and wool.

There is need of a much larger number of mutton sheep in the country than at present obtains, and we have no doubt that small flocks of sheep could be kept on dairy farms with advantage. The meat is healthful and nutritious and can be grown more cheaply than beef, while it ought to be used more largely by farmers, who now rely upon pork as the standard meat for the table. Sheep require good fences to keep them within prescribed inclosures. Stone walls sufficient to turn cattle will not do for sheep, as they find a foothold on the stones to scale the walls, and on this account many farms are not in a condition to keep sheep.

Sheep husbandry is not so exhaustive to the soil as grain raising or dairy farming, and on lands much worn will be found one of the means of renovating such lands. There are many arguments that could be used in favor of having English sheep upon our dairy farms, but the most potent is that of profit, and this will be sufficient to arrest the attention of dairymen to the subject. A correspondent of the Practical Farmer, in referring to coarse-wool sheep husbandry, says:

"When I first began farming, twenty years ago, I depended entirely on South Downs. They have always proved with me prolific breeders, capital nurses, hardy and good feeders, and my South Down mutton ranks in the market with 'gilt-edged butter.' I inform my regular customers when I am going to have a fine leg or loin of pure South Down mutton, and they go off fast at three or five cents above market price. In fact, South Down mutton is the best mutton in the world."

Again he says:

"I have made one cross on my flock of one hundred ewes with the Cotswold. The best and finest carcass has resulted where the Southdown buck was used on the Cotswold ewe. I do not want any finer sheep than this makes, and I try to keep them for my purpose one-half South Down and one-half Cotswold. What lambs I have to spare are all sold in advance to your butchers at about $8 per head. I raise roots, which are I consider indispensable in the sheep business, and with good management I have the lambs in market in March and April. Two-thirds of my ewes usually have twins. With lambs at $8 to $9 each and wool at 50 cents a pound, the profits on one hundred ewes, it will be seen, are very considerable."

It has been stated that from eight to ten sheep may be kept on the same feed that it will take to keep one cow; but put the number of sheep down to six as the equivalent of the cow and it will be seen that much larger profits can be realized from the sheep, while the labor in sheep husbandry is certainly not so much or so expensive as that of dairying.

SUGGESTIONS ON THE CONSTRUCTION OF FARM DAIRIES.

The late Joseph Harding of Marksbury, Eng., had some ideas concerning cheese-making and cheese curing-rooms which are deserving of attention. Mr. Harding was a practical cheddar dairyman, the most noted of any in England, and he was well acquainted with the needs of the dairy. He made many improvements which have been highly approved in England, and we give briefly an abstract of some of his suggestions. According to his idea the milk-room or cheese-making department should be capacious and lofty (at least 10 feet in hight), so that when furnished it may still appear roomy. The floor, which should be raised (not inconveniently) above the level of the ground, ought to be composed of cement or some kind of concrete, so as to be free from joints or cracks. It should be made to incline from all sides to an open escape-drain, covered by a patent sink-trap. Thus the room could be easily washed, speedily dried, and kept sweet and wholesome. He suggests that all of the windows should be provided with two, if not three, sashes, the outer one of finely-perforated zinc, the second of glass, and the inner of canvas, to soften the rays of the sun. At intervals around the room and near the ceiling should be placed ventilators, which may be opened or shut at discretion, to allow accumulated steam or foul air readily to escape.

The milk should by no means be brought into the dairy by the milkmen. To avoid this a hole should be left in the wall nearest the milking barn or yard, and outside should be placed a tin or zinc receiver of adequate size, and connected therewith an open conduit to convey the milk to the cheese-vat within. A stream of cold water, governed by a stop-cock, should, if possible, be introduced into the dairy. Provision should be made for conveying the whey in pipes from the cheese-vat to a capacious cistern. The pipes may be laid beneath the floor.

In the construction of curing-rooms regard should be had to the use of non-conductors of heat in the roof, such as straw or such-like material, beneath the roofing. The walls should be continued a foot or two above the ceiling of the cheese-room. These precautions, it is believed, will do much toward neutralizing the intensity of the summer heat. The windows should correspond both in position and structure with those of the milk-room below. The room should be about nine feet in hight, with at least two ventilators, either through the roof or in the side walls, precisely the same as in the milk-room; if in the side walls, they should be made air-light, to be opened at discretion.

Experience has taught us that the sun's rays and a share of his heat are the best means we can have for drying and purifying both rooms, and when these become insufficient, as they do in fall or toward the winter months of the year, we must resort to artificial means to supply their place and maintain the desired temperature. Heat is not only the agent by which the whey is effectually separated from the curd in the process of cheese-making in the dairy, but without heat the cheese will not properly ripen in the cheese-room. The temperature should not be allowed to fall below 54°, and a range of temperature from 54° to 64° must be maintained or the cheese will never properly ripen. A cheddar cheese well made, when removed from the press to the cheese-room, says Mr. Harding, contains a certain amount of moisture which will readily evaporate in proper temperature and the cheese will properly ripen. But if the temperature be low or damp, or both, the process of evaporation and ripening will be slow, and the moisture lodging in and about the rind of the cheese will cause it to be thick and white and will damage the flavor. From observation and experimental tests it is found that 2,000 pounds of newly-made cheese will give out nearly two pounds of moisture in 24 hours, and there should be sufficient heat to expel all damp and noxious vapors, thus facilitating the ripening of the cheese and leaving it as clean and rich-looking as though it had arrived at maturity in the summer months. Hot water conveyed in pipes about the room is safer and more cleanly, and diffuses the heat more equably. Hot water is, therefore, the best means of heating the cheese-room. Pipes proceed from the boiler to and around the cheese-room, and descending thence to the milk-room, pass through it and return to the boiler. As the water heats, so it circulates and does its work of heating all the way round. The pipes are laid in the space between the cheese and the skirting, thus throwing up the heat behind the cheese, where it is most needed.

FALL TREATMENT OF CALVES IN THE DAIRY.

Calves require special treatment at this season of the year. Grass begins to depreciate in nutritive value when the first frosts occur, and as cold weather approaches, calves not unfrequently run down thin and weak and are not prepared to meet the rigors of winter. There is no season of the year when extra care and feed are more needed than in the fall, before the animals go into winter quarters. Calves require to be kept in a thrifty, growing condition, and if checked in their growth during fall for want of proper nourishment, they will be apt to fall sick in early winter, and can then only with great difficulty be kept alive. Winter is a very unfavorable time to resuscitate weak and sickly animals, and it is always better to guard against this trouble by care and good feeding during fall, for calves that are not allowed to lose flesh and become weak at this season will, with fair treatment, go through the winter without trouble. It is well, then, to commence feeding calves a little grain or ground feed, pumpkins, the tops of turnips, beets and carrots when grass first begins to fail. Oats, either ground into meal or in the grain, make a good food for calves, and it is of advantage to teach them to eat extra food of the kind named at the time suggested, because later in the season they may be more dainty in their appetite, especially if sick and debilitated.

Calves when brought to the barn in the fall ought not to be allowed to run indiscriminately with larger and older animals, because they often receive harm by being hooked and shoved about by the vicious members of the herd. They are often deprived also of their due share of food, and in consequence fall away rapidly.

If whey or skimmed milk can be had from the dairy, they will make a good feed, and a little oil-meal, say a pound to each animal, cooked and made into a gruel and added to the milk or whey, will greatly add to this kind of ration. In raising stock for the dairy, it is desirable that the animals be taught early to eat all kinds of slop and that they get an abundance of succulent food, as by these means the capacity of the stomach is enlarged and milk secretion is promoted. It is important that calves make a continued growth during the first year, for if they are not stunted during that period they will be likely to "come in milk" when two years old; and our experience in growing stock for the dairy goes to show that the best cows for milk, other things being equal, are those which drop their calves as early as the time named. But in addition to the greater milk habit of animals coming in at two years of age, there is the increased profit to the farmer, since the milk yielded during the following year will be more than sufficient to pay the cost of keep, while the animal "coming in milk" one year later adds in her keeping a very considerable extra expense.

In conclusion it may be proper to remark that calves in the fall should be sheltered from the cold storms of rain and sleet incident to that season of the year. This is an important item in fall management, and one which is quite too often overlooked and neglected. Animals of tender age that are allowed to lie out at night exposed to drenching rains, mingled with sleet and snow, not unfrequently contract colds which lead to ills that impair the constitution, and in this way the stock becomes weakly and possessed of less endurance than they would have if properly cared for when young.

The raising of "deep milkers" and profitable stock for the dairy does not depend altogether upon breeds. The animals must be properly fed and cared for from the start. The raising of dairy stock should not be left to chance, but should receive careful attention, guided in all its branches by thoughtful foresight and intelligence.

Adulteration of Butter.—From The Farmer (Eng.) we learn that prosecutions are common for adulterating butter in England. The small tradesmen are first arrested for selling an injurious article, and in turn they prosecute the wholesale dealers, and in this way the matter gets pretty well "ventilated" in open court.

Pomological.

BEURRE HARDY PEAR.

This is one of our good autumn varieties which succeeds over a tolerably wide range of country, the tree being very hardy, vigorous and productive. It is a large variety and of the form shown in the accompanying outline illustration. The skin is greenish, covered with light russet, considerably shaded with brownish-red and sprinkled with brown dots. Stalk about an inch long, curved to one side, as shown, and inserted in a small, uneven cavity. Flesh buttery, melting, juicy, brisk, vinous, and highly perfumed, but sometimes slightly astringent next the skin.

In the Northern States this variety ripens in September and October, and is well worthy of being placed in choice lists of autumn varieties.

OUTLINE OF THE BEURRE HARDY PEAR.

PERSIMMONS IN VIRGINIA.

In answer to your inquiry about Persimmons, I will state that nearly all the wild fruit ripens after frosts, or about Christmas. Small quantities of Persimmons are found in our markets, as they are used for making pies, puddings and a kind of beer, though, for my part, I greatly prefer the natural fruit. On my father's farm there is a tree called the "Honey Persimmon," and the tree bears a crop every year. This variety begins to ripen the last of August and lasts until about the 15th of October. I do not know of any tree the fruit of which ripens so early as this. The fruit is quite large, twenty-five to thirty-five weighing a pound. Color, light yellow, and each fruit contains from five to eight seeds. There are several varieties in this neighborhood, some light, others dark colored; some very sweet and others quite tart.

Norfolk, Va. JOHN G. D. BAUN.

WHIFFS FROM CANADA—A POMOLOGICAL FURORE.

The Horticultural Society of the City of Montreal has caught the Centennial fever, and with a laudable and unwonted energy, its more active members have collected, within a small circuit of country, nearly three hundred varieties of apples, many of which are new and valuable seedlings. The contribution of one fruit grower was eighty seedlings, chiefly from Fameuse seed, and of every variety of excellence. Some of them showed all the characteristics of the parent fruit; others were to be classed as "Runettes" and some as "Russets," while yet others were Fameuse in outward appearance, but hard and quite acid, totally unlike the rich, white, melting, tender, fine grain of the Fameuse, which is often called "Pomme de Neige," on account of its white flesh, which contrasts strongly with the deep red of the skin. Sixty seedlings from this orchard were sent to Philadelphia, and with others of that ilk and our named varieties will make, let us hope, a respectable show for the cold, ice-bound Province of Quebec.

A part of the fruit selected was on exhibition in Montreal, and the aroma of apples pervaded the room when the long tables were aglow with ruby and russet beauties.

The pears were chiefly from city gardens, and the Flemish Beauty, with its golden russet cheek and fair, smooth surface, was a real queen among them. There were also about sixteen varieties of out-door grapes, of fair proportion, although not so large as usual, the dry weather having affected them as well as the apples. The Hartford appeared to me of unusual excellence—rich, dark, close clusters, and the reddish-brown Delaware could easily rival the boxes of this fruit imported that we see in the markets. There was the Semasqua, small and shiny; the Adirondac and the Crevelling, of ordinary merit; the good old stand by, "Concord," of large berry, ripe and sweet, but not so firm and large in bunch, as usual, and a plate of Isabella, grown by an Indian of Caughnawaga, that excited some interest.

It pleased me to see a show so cosmopolitan in its collection for the product of the French Canadians. A poor man's tree stood side by side and often compared well with the fruit from the garden of a millionaire, for here all men's apples were equal; and I, seeing this, said to myself: "Blessed be the Centennial Exposition that has caused this to come to pass!"

It struck me, however, as a matter for regret, that so few ladies came in to see the exhibit while I was there, although it was printed in large letters in the doorway, "Admission Free;" and I wondered if such would be the case were the display of millinery or new costumes.

The bringing forward of these seedlings will, I trust, be of value to the country, as many of the old, long-valued sorts are dying out, and if among the seedlings are found some combining hardiness, productiveness and first-class quality, we may thank the great incentive to their display—the American Centennial Exposition.

ANNIE L. JACK.

It is a matter for congratulation that our Canada friends have taken such an interest in the Centennial Exhibition, when, to use a common expression, "'tis none of their funeral." Still they have come forward nobly, and in many departments, notably in the way of farm products, have beaten us all out of sight. The Entomological Society of Canada is the only one making any display, our own "Bug-hunters" not even making an attempt to show what they have been doing in this branch of natural science. In the Butter and Cheese departments Canada is also ahead. We can, therefore, return Mrs. JACK's compliment and say, "Blessed are the Canadians, for out of their abundance they freely spare a portion to help along the Centennial Exposition!"—[ED. RURAL.

Scientific and Useful.

THE PRESERVATION OF TIMBER.

Any information relating to the preservation of timber and the most durable kind is, or should be, interesting to those who are engaged in the various industries wherein wood is used. The Journal of the Society of Arts in speaking of the preservation of timber says:

"Buried in the earth or exposed to the air, timber rapidly deteriorates, and undergoes the species of decomposition known as dry-rot. This decomposition may be retarded by the application of a coat of paint to the timber exposed to the air, or by carbonising the surface of that which is intended to be sunk in the ground.

During the last 20 years, several methods have been tried for making timber more durable, the principle of which consists in expelling the sap remaining in the ligneous fibres, in order to replace it by chemical solutions, such as sulphate of copper and creosote; but these processes, comparatively costly, and only partially successful, do not entirely accomplish their object. Starting from the fact that oak, chestnut, and certain American trees resist the action of air and damp better than others, and that they owe this property to the tannin which they contain, a chemist proposes to tan the timber by substituting for the sulphate of copper and creosote a compound of tannic acid and iron. The object of injecting various substances into wood is to poison them, so that germs and microscopic growths may no longer live and propagate either on the surface or in the interior. Now tannin is one of the most active and certain destroyers of germs both vegetable and animal, which fact accounts for its preservative agency. Besides, it is to tannin that is due the almost indefinite preservation of leather. One peculiarity to be noticed in this process is that timber treated with this compound of tannin and iron, that is to say a composition similar to ordinary writing ink, is turned black.

The process of injecting timber with tannate of protoxide of iron is due to M. Hatzfeld; the Eastern Railway Company of France has experimented with it on some sleepers, and the Telegraph Department on some posts.

M. Boucherie has denied in a note to the *Academie*, the efficacy of this process, contending that the attempts already made to preserve timber from dry-rot by injecting it with iron salts have yielded only partially successful results, while sleepers treated by sulphate of copper have lasted 25 years and more. Reply is made to these objections by quoting—not the experiments of the laboratory or the workshop, but those made by time itself. It is not a rare circumstance to encounter in earth of a ferruginous nature the trunks of very old oaks, blackened and perfectly preserved; at Rouen, in 1830, some old oak paling was discovered as black as ebony, and dating back to the Middle Ages. Not very long ago, too, a Norman vessel built of oak was discovered in an almost perfect state of preservation in the neighborhood of an iron mine in Norway. It is more than probable that the preservation of the oak under these circumstances is due to the tannin contained in the wood; it follows, therefore, that by introducing a substance rich in tannin into timber that does not naturally possess it, its resistance to decay is increased.

SOME WONDERFUL STORIES BY DR. DOREMUS.

The celebrated chemist, Dr. Doremus, showed in the following manner, in a recent lecture, how extremes meet: Eggs can be cooked by the extreme of heat. Butter can be made like ivory, so that it can be turned. We may by the agency of this solidify many of the other liquid substances, and, indeed, many of the gaseous, but a more intense degree of cold is used, and we employ laughing gas. This laughing gas, which is heavy, is the carbonic acid we have shown; when squeezed forcibly by the pump it becomes as beautiful and pellucid a liquid as carbonic acid, and if allowed to remain produces a most intense degree of cold. We can, however, show the liquid. Let me ask you to observe, prior to making that experiment, a very curiously interesting one in regard to the spheroidal state of matter. We have here a glass lamp, and we place over this lamp a platina dish. In the platina dish we place some of the mixture of solid carbonic acid, and in the middle of it introduce the mercury, and we shall find that the mercury would freeze, showing that we have a cold at least forty degrees below zero. We used to make an experiment such as melting lead intensely hot and then putting the hand in and ladling it from one vessel to another; for if, in lieu of this, you take a quantity of melted iron you can plunge your hand into it with impunity, and workmen have even been able to walk on a bed of melted iron. Take a poker and put it in a hot coal fire, get it very hot, and you may lift it or wipe it on the tongue with impunity. We may have it so hot that the vapor actually protects us.

Here we shall have a more extraordinary illustration of it, for we cannot only make ice but freeze mercury. We will fill this little thimble with mercury, and as soon as it is intensely hot we will introduce the mixture, and will show this curious illustration and attempt to freeze the mercury. Those who make the experiment of the heated lead please remember to have the lead intensely hot and you will find that it gives out cold.

CHLORIDE OF CALCIUM FOR SPRINKLING STREETS.

According to a statement recently made before the Academy of Sciences of Paris by M. Houseau, great advantage arises from the use of chloride of calcium instead of water in laying the dust of public thoroughfares. The salt is, as well known, highly deliquescent, and is applied in solution, one application sufficing for a period of from five to seven days. Thus a roadway of 1 kilometre in length by 5 metres in width, which would require in hot dry weather four waterings per diem with water, at a cost of sixty francs per week, supposing the water to be supplied free, would require only one application of the chloride, at a cost of 40 francs only, that is to say a difference of 20 francs in favor of the chloride.

We commend the above to the Street Commissioners of N. Y. city. Besides laying the dust it might prove serviceable as a disinfectant in some of our putrid streets where diseases generate, thrive and run riot during the sultry months.

COLORED GLASS FOR ENTOMOLOGICAL CASES.

At a meeting of the Entomological Society of Belgium, some time ago, M. Capronnier was charged to make experiments as to the influence of different colors of glass on insect collections; the object being to preserve collections from the decoloration which green and carmine parts especially undergo in daylight. He operated with four tints of glass—yellow, violet, green and blue—also with uncolored glass. It was found that yellow is the best preservative; after 90 days it was the only color which left carmine nearly quite intact. It is not an absolute preservative, for at the end of this time the tint was slightly altered. It seems that the only way known at present of keeping collections absolutely intact is to keep them in darkness.

This is so well known to entomologists that those of the United States would not risk their collections in making an exhibit at the Centennial. Our Canada neighbors however have made a good show, but on our recent visit to Philadelphia we noticed that the colors of many of the butterflies and moths were disappearing, owing to the strong light to which they had been exposed.

LIME FOR WEEVIL.

A correspondent of the Country Gentleman writes as follows:—"Some years ago, hearing complaint of weevil in wheat about the close of harvest when I was ricking my wheat, I got fresh slaked lime and threw it over the rick in building it, laying two courses of sheaves, then lime sufficient to whiten the stack. There was no weevil in my wheat. A neighbor who threshed his wheat from the shock came to me a few days after and said he should lose his wheat, for it was alive with weevil. I told him to throw lime over it, and shovel it through his wheat, which he did. Two days after there was not a weevil to be seen in it."

Our farmers will do well to remember the above and try it. As a precautionary means it should be tried in every stack, and can as well be tried in the cleaned wheat. An intelligent gentleman has informed us that twenty-five years ago, when the brewers in New York had large quantities of barley on hand, they found that the grain put up in large bins was almost safe from the weevil; the little creatures worked a little in the top of the bins, but did not extend down much; besides a dust accumulated where they worked and destroyed them in a few days.

Field Crops.

CLOVER AS A FERTILIZER.

In a recent essay on green crops as fertilizers, read by J. L. Johnson, before the horticultural society of Warsaw, Iowa, referring to clover, he says:

"Of all plants with which I am acquainted, and which are especially adapted to our latitude and climate, the common red clover is perhaps the very best for fertilizing the soil; it being one of the best, if not the very best to collect the accumulated richness of the atmosphere; while its long and searching roots penetrate the soil in all directions, far beyond the depth reached by our most thorough and energetic plowmen, loosening the subsoil in all directions and bringing up mineral substance of the greatest value in promoting the growth of vegetables, grain or fruit.

Red clover as a fertilizer not only enriches, but renders the soil more open to admit the circulation of the atmosphere, thereby retaining the moisture and thus producing the best results. We should endeavor to attain to a proper knowledge of the wants of the soil, for it is only by doing so that we become able to decide as to what fertilizer is most needed, or what rotation of crops to grow for the benefit of the soil. Knowledge and energy are the real foundation of profitable farming.

In all cases where soils contain but little organic matter, a larger proportion of vegetable manure is required, and it is important that we bury beneath such soils all the vegetable matter possible, not only red clover, but also oats, rye, buckwheat or even weeds (if we are so careless or slovenly as to produce weeds,) as we may thus destroy the seeds of weeds, and at the same time increase the fertility of the soil. The amount of green manure in an acre of red clover is almost incredible. On the very poorest land enough can be produced, if utilized and rightly applied, to greatly enrich the soil. I see it stated in the California Farmer that Professor Gedzie, in a chemical test, claims to have found one piece of heavy June grass, (grass and roots together,) containing more than one hundred tons per acre. If this statement is correct, but few farmers have even a proper conception of the actual quantity of vegetable matter they add to the soil by plowing under a heavy grass sward of clover.

Then we must consider how easy it is for us to obtain this great fertilizer. It costs us no freight, as does the commercial manures; it requires no hauling, as does the barnyard manure, and it needs no spreading.

It comes to us freighted on every breeze, nature evenly spreads it over our fields, and we may, if we will, apply it with the greatest accuracy.

Then let me close by saying that we believe that to fill our soils with a mass of grass and clover roots and other vegetable matter, is to

make our lands fat, so that they will pay a good rent to the owner and tiller; it is to increase the fertility of the soil, by feeding and fattening it, as we believe it may be made fat in sod and in manure, as easily as we can make a poor pig to gain in flesh.

THE NEW LIBERIAN COFFEE.

MONROVIAN or Liberian Coffee has long been stated to be a superior kind of Coffee, although for various reasons it has not yet obtained a place among the commercial descriptions of the Coffee market. Partly on account of the alleged jealousy of the natives in Liberia, partly on account of the want of commercial enterprise in that part of Western Tropical Africa, partly on account of the firm hold on the market established in respect of the Arabian Coffee as cultivated in many countries, as well in the New as in the Old World, and partly for want of better knowledge, this finer and more robust species has hitherto been permitted to remain practically unknown to the markets of the world.

At length, however, thanks to the exertions of Mr. W. Bull, says the Gardeners' Chronicle of London, Eng., and the officials of the Royal Gardens, Kew, the attention of commercial men has been drawn to it, and a wonderfully important change, perhaps amounting to a revolution in this trade, is apparently about to be realized. Two destructive diseases infecting the old Coffee plantations in Ceylon, due to attacks of fungi, have compelled the planters to seek fresh plants that may be able to resist disease. The more robust habit, coupled with the lower and hotter character of the situations where it is indigenous, renders it probable that the Liberian Coffee plant, whether or not it be hardy enough to resist the diseases that have destroyed the old crops in Ceylon, will at all events be useful in that island, where previously it has been found impracticable to grow Coffee below an elevation of 2,000 feet above the sea level; and in other Coffee-producing districts like benefits may be anticipated.

The leaves of the new species are much larger and more obovate in figure than in the old; they are also of a firmer and more coriaceous substance. The seeds are larger, and although in the Arabian Coffee the smaller-sized berries, such as the Mocha variety, are preferred in the market and fetch a higher price, yet it is claimed for the Liberian Coffee that the larger berries are of the best quality and of the highest value. Liberian Coffee is now being grown on a large scale from seed imported for the purpose, both by Mr. Bull and at Kew, and a considerable business is being done in exporting young plants to the different countries where Coffee is extensively grown for economic purposes. The corollas of the flowers differ from those of Coffee Arabica, Linn., by their considerably larger size, and in being usually heptamerous (7-parted) or occasionally hexamerous, instead of pentamerous, as in the latter species.

Industrial Topics.

SPECULATION vs. LEGITIMATE BUSINESS.

THERE are probably, says the Am. Grocer, some of our readers who do not understand the terms used so often, "selling long" and "selling short." They both mean the same thing, and that is, selling what you have not got, and in very many instances, never expect to have. They mean that one man has made a bet that by a certain time some stock or some property will be at a higher price than it then is, and another that it will be at a lower price. Now we do not mean to say that property ought not to be sold for future delivery, for that would be foolish; we do not wish to restrict the legitimate handling of goods, for almost all and especially large business transactions require time to complete them and make deliveries, but we do say and mean that these bargains for the purchase and sale of any property, where the property sold is not intended to be delivered, and only the difference in the market value is to be paid, is gambling and of the worst sort, because it has a shade of respectability about it and is not universally condemned. It is done in stores and exchanges where estimable merchants meet to transact their business; it is done by some of our good men, but it has a bad influence on the parties, as it gives longer time to manipulate matters so as to make a bargain a good one. It is as demoralizing in its effect, with the single exception of contact and association with downright blackguards as to go to John Morrissey's pool room and bet his "banker," as they like to term it, that a certain card or color will turn up.

Actual transactions—that is the sale and delivery of property—are limited to the amount of property to be handled and by the laws of trade, but "selling short" and "selling long," to be settled by paying "differences," like the making of accomodation notes, has no limit. Such transactions do no good to the community at large, as one of the two parties must lose what the other gains; such transactions do not set the wheels of trade in motion. There may be, for instance, thousands of tierces of lard sold in this way, and not one solitary dollar pass hands except between two men or firms for the amount one has "won" from the other, while an actual sale for delivery of, say for example, 5,000 tierces of lard sets trade going in hundreds of different channels.

In the first place, actual transactions are governed by the general laws of trade and based on the wants of one community to sell and of another to buy; on the actual production and consumption of different parts of this country or of foreign countries; on the knowledge that one party has of the wants in one section, and that another has of the production of a different section. In a sale made in this way, although the person making the sale may not have the goods he has sold, yet, from his knowledge of what surplus there is in one section that must be marketed, he can ordinarily know about what he can buy for, and the cost of delivery at a certain point. This, although it is attended with some risk from fluctuations in values, (and oftentimes from these very fictitious sales which we now deprecate), yet is legitimate and results in starting trade all over the country. We will give an instance of the effect of fictitious sales on the legitimate trade. Supposing an order comes from Europe for lard. When the order reaches here, thanks to some speculators concerned in transactions in goods of which they never intended to handle a tierce, the market has gone up. On this account the lard cannot be bought at a price that will allow of its shipment to supply the legitimate European consumptive demand, and the foreign market will not respond to these speculative prices put on the article here by washed sales, or, as they are more familiarly known in Wall Street, "Puts and Calls;" so the goods, instead of being sent from the place of production, remain where they were, and we have to wait till one or the other speculator gets beaten, and then the market goes down to a point where this order might have been filled. But by that time it has been filled from some other section, or else the consumption has been restricted by the very high prices, and the property is left on the hands either of the producer or the dealer, and thus so much less gold comes into the country.

Take, in comparison, the effect of an actual transaction in lard. The beginning of improvement in trade is with the farmer; he gets his money for his hogs and pays it out to the storekeeper and the mechanic, whom he owes; or if he does not owe anything but is, as a great many of our farmers are now, a year ahead instead of being a year behindhand, he gives part to his wife. "Wife," says he, "I have sold my hogs; here is some money; go and get what you want for the house and children," and the wife is not slow to go to the store and shop and make things "hum." With the balance the farmer calculates how he can lay it out best, so as to have more to sell next year. Such a transaction benefits the railroads, which employ more labor in consequence of increased business; the cutter or packer, whose trade it starts up, employs more workmen; the cooper comes into play—he has to have more labor and supplies; the lard goes to the seaboard and the shipping is brought into requisition—and so on all through the thousand and one different channels of trade, an actual transaction benefits hundreds and thousands. Contrast this with one of these "washed" or "bet" trades that does no more good than the turning of a card in a gambling house and, in fact, does a deal of injury to the parties concerned, for it unfits them for legitimate transactions.

Now to our good readers, and especially the young, ambitious readers of our paper, we would say: Think these things over and see if you would not prefer that all your dealings should be of that kind, that would benefit in some way your fellow men, rather than to have them of that kind that they are not only of no benefit to any of them, but demoralizing to you, unfitting you for the more legitimate transactions of business. These "puts and calls," "selling short" and "selling long," washed sales, if you have anything to do with them, will make you in effect a gambler, unfit you for regular business, put a fever of speculation into your mind, and, if continued it will, in nine hundred and ninety-nine cases out of every thousand, bring you to grief and your wives and children to poverty, and will almost always involve your best friends financially in your down-fall.

We want our readers to be as they are, the energetic go-ahead, bright, smart, active business men of the community in which they reside. One such man is worth a thousand drones to a village town or city, and while making money for himself he makes money for others. Let each of us try to be that man and not a speculator.

Sheep Husbandry.

SHEEP—THE OUTLOOK.

THE Farmers' Friend, in commenting on the general outlook of sheep husbandry, gives the following very sensible advice:

Farmers who keep large flocks of sheep, should not dispose of them hastily, in view of the low prices they bring, and the cheapness of wool, as we are not always to have such times as exist at present. Probably in two or three years the prices will advance 50 per cent., from the fact that large portions of our wool growers will either go out of the business, or greatly reduce their flocks, no matter how much they are advised to "hold on." In some cases it will be well to get rid of your poorest sheep, and thus reduce your flocks somewhat; but our advice is to reduce your flocks as little as you can, and make them pay the expenses of keeping till prices go up. During the last 30 years, there have been a half dozen ebbs in the prices of sheep and wool, and yet those breeders who "hold on" came out all right. What you need most is good breeding rams; and we annex what an old sheep raiser says: "The best bred and best formed Merino rams may now be had for $50 to $100, and the long wools or Downs are quite as cheap; and when we reflect that we may have 50 to 100 lambs from a single sire, what a waste of money it is to use an inferior, flat-sided ram, because he can be had for $10 to $15! The defects of a bad sire, used for a single season, will be visible in a flock for many generations, so that the injury done cannot be estimated; and the services of such an animal will never be accepted by an intelligent breeder, if tendered as a gratuity,

The selection of the breeding ram, where mutton is produced, must be from the long wools, or the Downs. If we make choice from the former, we must be careful to have an animal of stout and robust constitution. These sheep have been so generally forced with artificial food, that many of them lack the hardiness required for the farmer's purposes. What we must have, is a straight, round barrel, on short legs, with short, stout neck, and vigorous, masculine appearance about the head. The body should be well covered with a long and lustrous staple, of uniform quality. If the selection be of the Southdown breed, we should have the same general form as here described, but we ought to have a more compact and snug carcass, with a good deal more weight for bulk, than in the long-wool breeds.

The Horseman.

VETERINARIAN SCHOOL WANTED.

A BOSTON BOY, says the Scientific Farmer, writes from the Royal Veterinary Institute, Berlin making a strong appeal for means, for establishing a Veterinarian School in connection with Harvard University. If it were possible to have this school established upon a firm basis, and with such a connection as this University would guarantee, simply from its own standing both at home and abroad, the direct benefit to our great stock-owning interest, and through them indirectly to the whole country, would be almost beyond estimate, substantially or humanely. Regarding the means of educating men for this profession we are to-day immeasurably behind every other civilized country. Even the governments of China and Japan are taking the matter in hand, establishing schools, and importing educated Veterinarians from abroad as professors. Why is it that we Americans, a nation as enlightened as we suppose ourselves to be, so persistently ignore the claims of the Veterinary art, and either allow our animals to suffer, and ourselves to sustain unnecessary loss at the hands of a set of ignorant men, self-styled Veterinary surgeons, who do not know the first rudiments of anatomy, pathology, physiology, or the action of drugs? or else, having had experience, follow the advice recently given by a noted divine, "and keep the horse doctor as far away as possible from the sick and suffering animal." Is it right that such a state of things should exist when there is, as the experience of other countries has shown, a profitable, feasable, and honorable remedy? Is there any one who does not believe that animals suffer as acutely as men from physical pain, or that their diseases, if properly understood by the person in attendance on them, are any the less amenable to treatment?

CAUSE OF MEGRIMS IN HORSES.

A CORRESPONDENT of the Veterinarian says that he has been in practice as a veterinary surgeon for thirty years, and has taken pains to ascertain the cause of megrims. On examining the horse's eye immediately after or during attack, he has found it exceedingly convulsed and acted upon by spasmodic affection of the muscles—a symptom that could not be present if the disease arose from distension of the arterial connections of the brain. He has never seen a saddle-horse afflicted with this complaint, and all the cases he has seen occurred when the sun was shining brightly, or by moonlight, when snow was on the ground.

He had a favorite pony which was subject to megrims. He removed the winkers from the bridle and the pony never showed any symptoms of them afterward. It then occurred to him that the reflection of the sun upon the winkers, falling directly on the optic nerve, was the cause of this extraordinary complaint. Since then he has had many patients affected with megrims, and in every case he has ordered the removal of the winkers, or if there were none, to have the eyes of the horse shaded with a piece of leather three or four inches wide, extending in front from winker to winker. In every instance this treatment was successful. He feels satisfied, from the symptoms he has always observed in megrims, that the brain is not the seat of the difficulty.

CEMENT FOR CRACKED HOOFS.

M. DEFAY has discovered a preparation, by means of which sandcracks or fractures in hoof or horn may be durably cemented up. Even pieces of iron can be securely joined together by its means. The only precaution necessary for its successful application is the careful removal of all grease by spirits of sal-ammoniac, sulphide of carbon, or ether. M. Defay makes no secret of its composition, which is as follows: Take one part of coarsely-powdered gum-ammoniacum and two parts of gutta percha, in pieces the size of a hazel-nut. Put them in a tin-lined vessel, over a slow fire, and stir constantly until thoroughly mixed. Before the thick resinous mass gets cold, mold it into sticks like sealing-wax. The cement will keep for years, and, when required for use, it is only necessary to cut off a sufficient quantity and remelt it immediately before application.

The Centennial.

THE JOHNSTON HARVESTER CO.

THE reports are now, at last, given to the public, and it is only necessary to read them to form a correct idea of the judgment of the experts who have given their unbiased opinions on implements entered for competition.

It will be seen by this report of the Jurors of group twenty-three, that the Johnston Harvester Company, of Brockport, New York, have, in all essential respects, won every attainable honor, or, in other words, secured a Sweepstakes Award, that places them in the front rank of Agricultural Implement Manufacturing Companies. On analysis of the report, it shows that *each* implement in the exhibit is singled out for approving judgment, which is a mark of rare honor. This last triumph, with the European honors previously scored, makes the record of this company a proud one indeed.

OFFICIAL REPORT.

Awards.

Mower, Wrought Iron Harvester, Single Reaper Combined Machine No. 1, Combined Machine No. 2.

Report.

For large exhibit of machines. For excellence of material, strength, durability finish and attention to details as evidenced by the following facts:—Solid wrought Iron frames, Table attachments very strong, and easily adjustable by lever and outside wheel that runs in a crank shaft. Pitman Rod attached to knife by ball and socket, giving great elasticity. Patent Key nuts easily adjustable to compensate for wear. Motion communicated to rake shaft by square-linked chain gear, with spring tension rollers. Cam gear for traverse of rake, original, automatic, and controlable. Speed of knife can be changed by reversible pinions. Driver's seat balances the pole. The machines work almost noiseless, thus indicating very little friction. Prices reasonable.

J. R. HAWLEY, President,
A. T. GOSHORN, Director-General,
ALEX. R. BOTELER, Secretary, pro tem.

CENTURY BLOSSOMS.

IT was considered strange that the fine display of furs made and exhibited by Swedish firms should hold out so well, when it was known that they were very successful in making sales. Inquiry disclosed the fact that as fast as sold, the furs were replenished from stocks of New York merchants. This ought to be a soothing piece of news to those ladies who paid handsome prices for wraps, &c., under the impression that they came from the vicinity of Greenland's icy mountains.

Floricultural.

MISCELLANEA.

We have been asked what our object is in giving seeds away. Perhaps the following extracts from one of many letters received will serve in part to answer the question:—"I see in the last Rural that you have flower seeds to give away. You are very kind. If every one would do so that has more than he needs, how happy many others might be made. I take the liberty to send you a few seeds. They are not very choice. If you don't care for them, throw them away. They are the Wild Cucumber and German Pinks. The Pink is a perennial and very hardy. The blossoms which appear in June are small but sweet. I have plants three years old last spring that are thirty-six inches across. Some of the blossoms are double, some single—all are light-colored. I once had a great many flowers. My health is failing and I am afraid I shall have to give them all up soon. I think a home without any flowers is lonely enough. Please accept many thanks for your kindness. Yours with Respect, S. B.

In all persons, at all ages, the real love of flowers is a delightful, an inspiring sight. But it is most charming as observed in little children and in old people:—in little children often so young that it seems as inborn and as fervent as the love of parents itself;—in old people who preserve it through years undimmed, while many other objects have been loved and forgotten. There is that in old people who, though stiffened with age, can yet find pleasure in the care of flowers, that tells of lives not spent in vain.

Whether we want the seeds forwarded by S. B. or not; whether they are choice or "common"—we thank her for them and her kindly letter all the same. It is such little appreciatory acts and expressions that more than repay us for the trouble of gathering seeds for those who know so well how to value them.

White Weigela.—We have not found *Weigela (Diervilla) hortensis nivea* as hardy as the commoner sorts of this favorite shrub. It does not, besides, flower profusely in the spring, though its fall bloom is better. The facts that its flowers are white and that in the fall they appear when few other shrubs are blooming constitute its chief claims to especial notice.

Crape Myrtle.—This plant is now-a-days seldom mentioned. In the tent of the Centennial grounds put up for the Rhododendron exhibit of the Waterers of England, are two Crape Myrtles both rose-colored as we recall them. The larger is about eight feet high with a stem nearly as large as one's wrist. They were in profuse bloom several weeks ago and attracted the notice of all who visited the tent.

We purchased this spring a white Crape Myrtle (*Lagerstroemia Indica alba*) which bloomed in August continuing until frost. The leaves are small, opposite and the branches of young plants spreading and drooping. The petals which are frilled like a cambric ruffle have claws half an inch long and resemble those of the Clarkia, though larger and less perishable. The calyx is broadly campanulate and the center of the flowers filled with long stamens, some of which are abortive and shorter and more slender than the others.

These plants are said to be hardy as far north as Philadelphia with a little protection. Probably in the climate of New York it would be safer to remove them to the cellar or to the greenhouse where, if room is not an item, they may be permitted to continue growth.

Plant Protection.—During the past frosty nights we have covered several half-hardy plants with sheets etc. We have found that wherever the covering has rested upon the leaves of such as *Ficus elastica, Eucalyptus globulus, Malvaviscus arboreus*, those leaves have been frost-bitten, the covering, when in contact, acting as a conductor instead of a radiator. From this an important inference may be drawn. In protecting all plants that we fear may not stand the severities of winter, be careful that between the plant and the protecting materials, a space be left.

Eucalyptus globulus.—This is handier than we had supposed. It has stood three frosts one of which formed ice an eighth of an inch thick along the river banks of this vicinity.

Shell Flower.—It was stated in our account of this plant that it did not need support, the branches being strong enough to support themselves. This was true at the time it was written when we supposed it had attained the greater part of its growth. Not so. Every branch continued to grow as rapidly afterwards as before, forming a whorl of cups and flowers with every pair of leaves, until many were five feet in length. When no longer strong enough to hold their weight, the branches bent over so as to rest upon the ground and from this part shot up as erect as ever like so many Chinese Pagodas—from their striking resemblance to which we have before compared them.

Again, we did not know that the cups or calyces skeletonize so beautifully. The parenchyma entirely disappears leaving only the veins and veinlets which are firm enough to preserve the shape of the cup perfectly.

Notice.—Under the "Little Announcement" we shall not send the seeds selected by our subscribers until all the applications have been received, so that we may distribute them in equal quantities. As, therefore, some limit as to time will be necessary, we name Nov. 10—on which date we shall presume all applications to have been received.

Centennial Evergreens.—In our late Centennial correspondence, we stated that in the plots of Messrs. Hoopes, Bro. & Thomas of West Chester, Pa., there were about two hundred different species and varieties of Evergreens. We ought to have said three hundred and fifty. The truth is we found it something of a task to count them separately and so to avoid time and trouble we made the best guess we could. It was a very poor one as it appears.

NOTES.

The Journal of Horticulture says that one of the most attractive shrubs recently introduced is *Weigela amabilis aurea*. The flowers are crimson and white, but the foliage entitles it to the name of golden, for the leaves are totally yellow. The color is stated to be but slightly altered by exposure to either sunshine or shade.

An additional variety name given this shrub is *Loogmansi*—but surely the above is long enough.

Golden shades are very pleasing among shrubberies and there are few really good shrubs possessed of it.

The Permanence of Varieties.—It would perhaps be difficult to find a better instance of this fact than is afforded by the variegated *Aucuba Japonica*, so common in our shrubberies and urban gardens. The date of its introduction, says the Gardeners' Chronicle of England, is 1783, and, being, as is well known, a female plant, every individual that we now see must be a continuation of the one specimen originally introduced into Europe, retaining its special variation unchanged during two centuries.

Arboricultural.

FALL OR SPRING FOR TRANSPLANTING?

We have never discovered any reason why a plant, let it be an herbaceous plant, a shrub, vine or tree, should be transplanted in the fall rather than in the spring for the climate of New York and north of it. When removed from one place to another in the same grounds and care is observed to preserve a ball of earth or, without the ball of earth, all the roots and fibers intact, it does not matter whether fall or spring be chosen. It is a question merely of convenience. But when they are removed from nursery grounds and subjected to the delays and exposures inseparable from systematic business routine; when the roots are shortened and crowded together in packages made as small as possible so as to avoid unnecessary expenses in their transit—then we have to determine whether plants so circumstanced stand a better chance of life than those transplanted in the spring.

One of the chief reasons assigned as to why fall planting is preferable to spring planting is that in the fall, the soil being warm and the roots having an opportunity to grow, they become in a degree established and to that extent prepared to hold their own against the possible or probable droughts of the succeeding spring or summer;—whereas in spring transplanting, they are plunged into a cold, water-soaked soil; the leaves are precipitated before root growth commences by the air being warmer than the soil and so the plants suffer from the fact that the roots cannot supply the demands of the leaves.

Why not transplant evergreens in the fall? Is not the soil as warm for them as for deciduous trees? Is not the ground as cold for them in the spring? Because, it is answered, evergreens are never at rest. Their leaves are always at work and so consequently are their roots. But this would seem a very good reason, agreeably with the above theory why they should be transplanted in the fall since as they are never at rest, they would the sooner form new roots in the warm soil of fall than in the cold soil of spring. The reverse is known to be the fact.

It is recommended not to transplant in the fall until the leaf has fallen, or is ready to fall, and the plant has prepared itself for its winter's rest. Do the roots of trees, etc., continue to grow after this period? Is the root active after the top ceases action? Up to the time that the ground becomes hard frozen, yes; afterwards no, unless the roots descend to a depth beneath the action of frost. But the roots of nursery trees prepared for shipment never do, and the check which the tree undergoes from the time of being dug up in the nursery to the time it is reset in its final quarters, is sufficient to arrest all root action for the rest of the fall or at least until freezing weather would, in any event, present further development.

Suppose we make a cutting of any hardy plant—strike it in late September, plant it out in late October. Without protection, as a rule, this plant will be found dead in the spring. The roots are too tender to endure the rigors of winter. It is so with transplanted trees. The fibrous root-growth which may be induced by the warmth of late fall or by mild periods during midwinter, being near the surface, cannot stand a zero temperature that may immediately follow—and the result is that the tree is weakened by just the amount of nourishment required to produce those fibrous roots.

In the question as to whether it is better to transplant in fall there is but one thing to be considered. Will the transplanted tree be injured by the probable severity of the ensuing winter? If they are trees that are never injured by twenty or thirty degrees below zero—never injured by freezing to-day and thawing to-morrow, plant in the fall. That a tree with its roots cut back as they are for shipment, is as well able to endure the effects of severe winters as one that has its roots entire, is an absurd supposition. But the spring-transplanted tree has its roots shortened the same? True, but the winter is passed and spring-time, its natural growing season, is at hand. It is essential, certainly, that trees and shrubs should be removed in early spring before a bud has swollen. If otherwise; if the plant is half-leafed out when received from the nursery, be sure it is greatly weakened and that in case of drought, it will be the first to perish. Without a drought this plant will scarcely more than sustain itself—and another year at least will be required to restore its vigor. Cutting back in such cases can do no good. Its strength is spent. Last year's labors have been chiefly thrown away. The leaves are ready for work—the roots are not.

In the fall of '74, we transplanted about 100 trees and shrubs of various kinds received from nurseries. All know of the exceptionally severe winter following. A majority of them—let us say sixty per cent were found to be dead in the spring or so badly injured that they died afterwards. This spring we received and planted as many more. The drought has been as exceptionally severe as was the winter of '74 and '75. Yet our losses have been less than twenty-five per cent. This is not offered the reader as positive proof in favor of spring transplanting, since the varieties and species of the two sets are not given him for comparison. But to us who know of all modifying circumstances, it is convincing that where plants have to be purchased of nurseries at such a distance as to necessitate packing and shipment, the spring is greatly to be preferred for the climate of New York and north of it.

CHESTNUT PLANTING.

We observe in the Country Gentleman, in answer to an inquiry for directions for planting Chestnut orchards or groves, that the editor, in reply, commences by stating that the seed should always be planted where the trees are to remain, but does not give the reason therefor. Now, having had large experience with the Chestnut, we claim that the position taken by the aforesaid paper is at variance with the experience of our best growers, and that the failures which would ensue by planting the nuts directly where the trees are to remain, exposed to the depredations of animals, large and small, domestic and wild, for the first year or two of their existence would be greater than if nursery-grown trees of reasonable size were planted.

We are aware that some varieties of trees transplant with greater difficulty than others. But we do not place the Chestnut, either American or Spanish, in the difficult class. We claim to have grown and transplanted more American Chestnut trees than any one firm in the United States. We have transplanted one-year seedlings, and all intermediate sizes, up to seven feet high, and never made a failure. Although we have, in some instances, planted very late in the spring, even after the trees were partly in leaf, our experience demonstrates that they will transplant as easily as any other nut-bearing tree, and possibly as any fruit tree on our soil, which, we must admit, is peculiarly adapted to the growing of Sweet Chestnut.

In soils not as congenial, it would be far more difficult to rear from the seed than to succeed by transplanting, as all know who have had experience in the rearing of seedlings, not of Chestnut only, but of most forest and fruit trees that the most precarious time is in the germination of the seed and carrying the young seedlings through the babyhood of their existence. As familiar examples we would cite Evergreens, Larch and Mahaleb Cherry seedlings, and, in our humble opinion, it would be just about as sensible for agricultural journals to recommend the planting of the seeds of these where the trees are to remain as to recommend such treatment for the Chestnut. We have many times imported Spanish Chestnut trees from France and planted on our own grounds, and with as uniformly good success as we have experienced with other forest trees, or even Quince and Pear Stocks.

Painesville, Ohio. Storrs, Harrison & Co.

[We fully coincide in the opinions expressed by the above correspondent, for, in our own experience in raising and handling Chestnut trees, we have had uniformly excellent success in transplanting, both the foreign and native varieties. Nut-bearing trees, if subjected to the same preparatory processes in the nursery, may be transplanted with as uniformly good results as our common fruit trees, and it is an injury to arboriculturers to teach the contrary.—Ed. Rural.]

THE DECAY OF TREES IN PARKS.

The trees in Hyde Park, London, are exhibiting signs of blight and decay, greatly to the regret of all who frequent that delightful and fashionable place of resort. It is suggested in Hardwicke's "Science Gossip" that the cause of the trouble is the careful removal of the fallen leaves and fruit which form the natural food of the trees. A portion of the phosphate or oxalate of lime, which the trees have drawn from the soil, is stored in the tissues of the leaves and fruits in the form of crystals. It is this which renders leaf mold so valuable as a manure. Therefore, when the tree sheds its leaves, they should be allowed to remain around its base, in order that they may restore to the soil the important constituents which they have taken from it. When they are habitually removed, the soil becomes impoverished, and incapable of sustaining a vigorous vegetation. "Had the old forests been always cleared of the fallen leaves, there would long since have been a decay of that noble vegetation which still excites the admiration of the traveler. Rich and deep soils may afford for long periods a sufficiency of calcareous salts for the preservation of the plants, but not so shallow and poor soils. The quantity of saline matter annually taken up, even by a single tree, from the soil, and appearing as microscopic crystals in the plant, is prodigious; and, unless this saline material be returned to the earth, exhaustion thereof must sooner or later occur."

Around the Republic.

OUR GOVERNMENT SURVEYS.

The system adopted by the United States Government for surveying its territory, and dividing and subdividing into Townships, Sections and Fractions of Sections, has, by its simplicity and adaptitude for the purpose intended, received merited commendation.

The first work of the surveyor is to establish a principal meridian, which is a line run due north and south, passing, when convenient, through some marked geographical or topographical point. As this is a line from which other measurements are made, great care is taken in its establishment. Across this meridian, and at right angles therewith, runs another line called a base line.

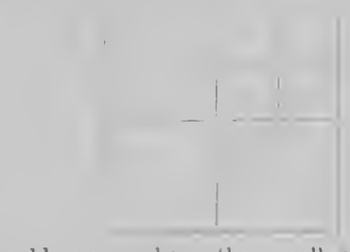
Lines parallel with both the meridian and the base lines are then run at intervals of six miles—thus dividing the area into tracts six miles square, which are called Townships. These townships are subdivided into 36 plots, each one mile square, which are called Sections, and contain 640 acres. These sections are numbered from 1 to 36, commencing at upper right-hand corner and counting across the upper row, and thence back on second row, and so on. The accompanying diagram shows a township divided into sections and the manner in which the sections are numbered:

	5		3		1
7		9		11	
	17		15		13
19		21		23	
	29		27		25
31		33		35	

The lines, bounding townships, which run parallel with the meridian are called Range lines, and those parallel with the base, Town lines. Any number of townships situate in a north and south line are called a *range*, and are numbered east or west from a principal meridian. Each series of townships situate in an east and west line are numbered north or south from a base

line. So if we are told that a section of land in any State is located in Township 10 north, Range 10 east, of any principal meridian, to locate it on a map we first look for the meridian named; then we count on the meridian from the base line north to the tenth township; thence following that series of townships east from the meridian, the tenth will be the one desired. To facilitate search, all good maps have the townships numbered on the meridians and the number of Ranges given on the base lines.

Each section is subdivided into quarter sections, and these again subdivided into quarters.



Should you purchase the small square shown at the upper right-hand corner of the above diagram, which represents a section, it might be described in your deed as the N. E. ¼ of the N. E. ¼ of Section 12, Township 10 N., Range 24 W. of the 6th principal meridian, and would contain 40 acres.

In consequence of the globular form of the earth, lines run by compass due north are not in fact parallel, but approach each other, and when started six miles apart on a base line, they are found to be less than that when measured on any township line north, and consequently the north and south lines of any township are not exactly of the same length. If the north and south lines were continued across a State, the difference in area between the northern and southern townships would be very considerable. To obviate this difficulty and have the townships as nearly of a size as practicable, new measurements from the meridian are made on township lines at intervals of five or ten townships. This occasions an offset or jog in the range line which is quite apparent on the maps. When the township lines are extended a great distance, the accumulation of offset is so great that sometimes a continuous range line is carefully run and new measurements made therefrom. Such lines are called Guide Meridians. L. A. R.

Domestic Economy.

ORIGINAL RECIPES.

I SEND you some recipes for the benefit of the ady readers of the RURAL; they are as follows:

Coffee Cake.—1 cup of cold coffee, 1 cup of sugar, 1 cup of molasses, 1 cup of fruit, 1 cup of butter, 1½ teaspoonful of soda, spice to your taste, 4 cups of flour.

Cookies.—1 cup of butter, 2 of sugar, ½ cup of sour cream, 2 eggs, 1 teaspoonful of soda.

Doughnuts.—1 pint of sour cream, 3 eggs, 2 cups of sugar, 1 teaspoon of soda, mix quite stiff.—FARMER'S GIRL.

SELECTED RECIPES.

The Art of Cooking.—The art of cooking Indian-meal has not received that attention which its merits deserve. A baked Indian pudding, with a little suet to soften and lubricate the meal, makes a dessert fit for a Governor, and almost too good for common folks. With milk, butter, eggs, and sugar, and lots of fruit, Indian-meal can be made to keep a family in the most thrifty condition. These are all produced, sugar excepted, on the farm, and on many farms we need not make an exception. When sugar is made from beets in this country—as it ought to be, and soon will be—the farmer will be almost independent of the grocer, and can snap his fingers at tariffs and imports.

Stuffing for Poultry or Fish.—1 cup of bread crumbs, 1 egg, 1 teacup full mashed potatoes, butter size of an egg, savory, sage, pepper and salt. The above with the addition of a chopped onion is excellent for goose, duck or wild meat of any kind.

To wash Dried Currants or other Fruit.—Put the currants into a colander and set the colander into a pan of water. Rub the fruit with the hands and stir it about when the dust, etc., will pass through the perforated bottom of the colander leaving the fruit clean.

Cheese Fritters.—Beat four eggs very light, season with salt, mustard and pepper. Slice thin half a dozen large sour apples, and half as many thin slices of good cheese as you have slices of apples. Put the cheese to soak in the mixture of egg and seasoning; let it stand a few moments; then fry in hot butter, like oysters, and serve hot.

Victoria Soup.—Take a couple of large or three small fat chickens, clean and skin them; take also ten pounds or more of veal, cut into pieces, and a half pound of lean ham; put these together into a very nice stewpan, with a bunch of parsley, and moisten them with clear boiling veal broth. Let this stew softly for an hour, then soak in the broth the soft part of a French roll; cut the flesh off the breasts and wings of the chickens, chop and pound it to a paste in a mortar, with the hard yolk of two eggs, the soaked crumbs, ten sweet almonds and three bitter, all blanched. Rub the compound into the soup, strain the whole, and add gradually a quart of sweet cream brought to boil by itself; boil it up, stirring till served. The seasoning should be mild, and a bit of sugar is an improvement.

To Remove Mortar or Paint from Windows.—Rub the spots of mortar with a stiff brush, dipped in sharp, hot vinegar, and paint spots with burning fluid or camphene, and sand.

Watermelon Vinegar.—Solomon Jewett, now a resident of Vermont, writes to the World as follows: About ten years ago, while on a sheep ranch, 165 miles back from Los Angelos, Cal., from whence we received our supplies, I took a 40-gallon oaken cask, and filled it with ripe, or nearly ripe, watermelons, all being bruised to a pulp or into quite small fragments, with a wooden pounder, as they were thrown in. Then the head was replaced, and every day we changed ends, one resting on the ground. In a little time the rinds of the melons changed to a pulp, and the whole mass was formed into a pleasant but not strong vinegar. But by the addition of a few quarts of molasses, we drew out occasionally from the larger cask into a smaller one, supplied with the plant, or "mother," all of which made very fine vinegar.

Hygienic Information.

SCHOOL-ROOM PERILS!

DR. RICHARD MCSHERRY, of Baltimore, writes the following to the Sanitarian on schoolroom perils. There is no bloodshed in the beginning, but there is towards the end in various forms of hemorrhage.

What else can be expected when young children are imprisoned for long and weary hours, day after day, and year after year, in close and stifling schoolrooms, where the air is habitually so foul as to be exceedingly offensive to any one entering from without, though unnoticed by those within, who are breathing it over and over again? A lady who is fond of plants and flowers, and has but a small space for cultivating them, says that in window-gardening she finds that her favorites require a goodly quantity of sun and air to thrive, which she seeks for them accordingly, while she sends those more tender plants, the children, to a horrid schoolroom, whence the rays of the sun are excluded, while the artificial heat, often itself loaded with coal-gas or carbonic oxide, is made mephitic with carbonic acid from many breaths, and all the exhalations that arise from a miscellaneous crowd of helpless and innocent little prisoners. This is not a matter of comfort or discomfort, but more clearly a matter of life or death with the children. What is the good of all the learning, such as it is, acquired in the schoolroom, and by gas-light at home, to a young girl who has a spinal curvature and a perpetual headache, and a weak chest, and indigestion, and flabby muscles, and, in short, universal delicacy in every part of her organism? How is she prepared for the wear and tear of life duties, and what kind of a help-meet is she going to make? The evil is a crying one; it is fraught with ruin, yet scarcely any but a few medical men seem to appreciate its importance.

What is the remedy? Fewer hours at school, and fewer studies at any one time. Frequent changes of position and air; a brief recess every hour to relieve the mental tension, stretch the cramped limbs, and enable the scholars to take in good inspirations of fresh air.

Let the schoolroom be cleared every hour, and thoroughly ventilated while the children play for a few minutes in the open air in good weather, or under shelter while it rains. The shelter should be provided, no matter what the cost. Life and learning are of little worth without health, but learning and health would both be promoted by these measures.

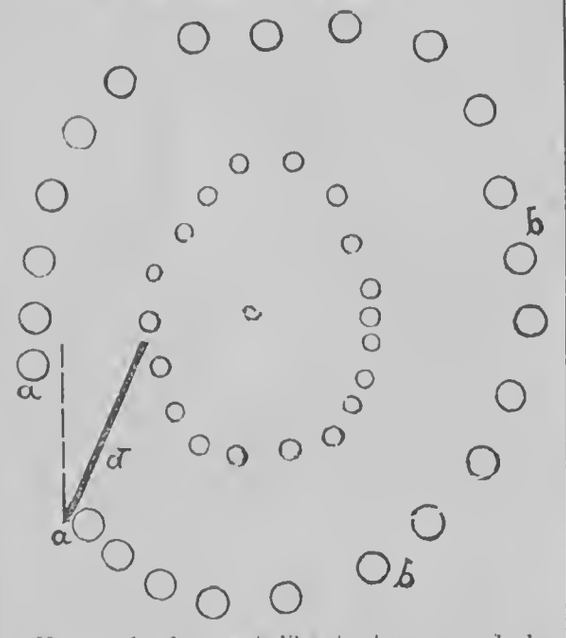
DOGS TAKE MEASLES FROM CHILDREN.

AN interesting case of this nature is described in a recent report of the Epidemiological Society. A dog licked the hand of a child lying in bed, and on whom the measles eruption was at its height. Twelve days later, the dog sickened and suffered for two days with nasal discharge, and four days later died with marked congestion of the throat and air passage. It has been held by some authorities that measles in man is the analogue of distemper in dogs—indeed, it has been urged that they are the same disease; but this case contradicts such a view, for the dog in question had, four years previously, gone through an attack of distemper, and although second attacks of the various eruptive fevers are common enough in children, second attacks of distemper are rare among dogs, while such second cases, when they do occur, are invariably of a slight and temporary nature.

The Naturalist.

A RUSSIAN WOLF-TRAP.

WE find the accompanying illustration and description of a Russian Wolf Trap in the Agricultural Gazette and, although, not new to us, it is worth describing again, as it answers well for nearly all of our larger animals including foxes and bears. Of course the bait may be varied to correspond with the game to be caught. At *a* is a door, by which Mr. Isegrim, the wolf, is apt to enter, enticed to do so by a goat, which is put into an inner inclosure, *c*. The wolf walks along *b*, *b*, *b*, arrives at *d*, which is a gate.



Now, as he does not like to turn round, he pushes against *d*, which will close up *a*, *a*, and be caught. Mr. Isegrim, sly as he is, is also very straightforward; he will not turn, he will run on, and whenever he arrives at *d* (which, perhaps, the wind may have thrown open again) he will push against it and shut it up again. Thus the night passes, and in the morning Isegrim is found and strangled with a sling, for to shoot him would not be advisable, as his "sweat" would keep off his kin. All this while the goat has been eating bean straw in her safe enclosure.

The month when wolves are particularly apt to walk into this Circean castle is the month of August, when they have to find tender food for their puppies; but they are caught all the year round, always in one and the same trap, which thus is the very best way in which to invest a few dozens of poles some 4 feet high, and it will be best not even to peel them.

CURIOUS FACT CONCERNING A FROG.

A SHORT time since a lad wished to eject a frog from an outhouse, and to do so he took up a large steel file that was lying near and touched the frog with its blunt point, but not so as to hurt it. The frog, however, emitted a singular scream, as though in pain, and continued to do so each time that it was touched with the file. The attention of a gentleman present having been drawn to the matter, he took a piece of deal lath and touched the frog with it in the same way, but the frog seemed to take no notice of the application, except to go on leaping in a natural manner. A few more touches of the lath provoking no sound, he took the file and applied it lightly to the frog, when a scream, apparently of pain, was again emitted. Is it not probable that the application of the file produced galvanism? or if not, what other reasonable explanation can be given?

The Apiarian.

BEE-KEEPING IN CITIES.

I OFTEN see the most extravagantly false statements published in regard to bee-keeping in cities; and the articles appear to me to be written in the interests of parties who have beehives to sell to city people. A writer in the American Grocer says: "Glass-hives have repeatedly been exhibited in New York, containing over one hundred pounds of honey, which has been made in the very heart of New York." A grosser falsehood was never written. Then this specimen of ignorance adds: "There is no doubt that the laboring man in cities can supply his family with rich, pure, virgin honey through the year at less than *one cent a pound*."

The writer goes on to talk of the great quantities of flowers in the yards of the people of New York, and the trees from which honey may be gathered, when it is a fact that bees gather no honey from such flowers as families have in their yards; and all the trees in New York, except fruit trees in the outskirts, are utterly non-productive of honey, unless an occasional maple tree may be found to afford a very little honey while in flower in the spring. The Grocer says: "Several mistaken writers agree in remarking that in foraging bees rarely go more than a mile and a half;" and then the writer argues, knowing that no honey can be gathered *in* New York, that bees will go "three and four miles" for it.

Now, the experience of bee-keepers in the whole world is, that the supply of honey must be *within* a mile and a half of the hive. But why don't these false writers give the names of the parties who obtained the "100 lbs. of honey in glass hives?" Why don't they cite the experience of individuals, naming them, and place of residence? Why don't we see some accounts of their success from N. Y. city bee-keepers, if they exist? T. B. MINER.

Linden, N. J.

WINTERING BEES.

THE Rev. M. MAHAN D. D. in writing to Moon's Bee World, from New Castle, Ind., gives his experience in wintering bees, which may doubtless be of value to thousands of the readers of the RURAL NEW YORKER:

Many of the most scientific and successful apiaries in the country have given special attention to winter management, and many plans have been suggested and tried, and many of them have been found unreliable. I have no doubt but that the best plan would be to winter in a cellar or repository if we could secure the right temperature and keep the hives dry. But these conditions are not easily secured, and in their absence the bees are better on their summer stands. I have observed that bees wintered in a cellar, or in a frost-proof repository, are more likely to dwindle away and perish in the spring than those wintered out of doors. I am not able to account for it, but I am satisfied that it is true.

Since I have kept bees I have had some rather costly experience. One winter I saved only four stocks out of thirty-five. That was the heaviest loss I ever sustained. Three winters I have wintered all my stocks losing none. As I have had my eyes open most of the time, and have endeavored to ascertain the bearing of all the facts connected with success and failure, I think I am able to give some advice which will help the novices in the bee-keeping fraternity to avoid very serious losses.

Of course the first thing to be looked after is a sufficient supply of honey to last the swarm until the flowers bloom in the spring. A little too much is better than not enough, though it is easy to feed in the spring, after the weather is warm enough to fly occasionally. Feeding in long continued cold weather is liable to produce disease. In this latitude a colony ought to have from twenty-five to thirty lbs. and should be looked after early in the spring, to see that the supply does not fail.

Another very important thing is winter passages through all the combs. This matter cannot be emphasized too strongly. Passages over the combs will not meet the case in long continued cold weather.

I have known whole swarms to starve to death with plenty of honey in the hive. They had eaten all within their reach, while there was plenty separated from them only by the thin partition between the ends of the cells of the comb. During warm days in winter the cluster of bees spreads out toward the sides of the hive, and when the weather turns cold, the cluster contracts.

Suppose we have a day or two of warm weather—warm enough for the bees to fly, and suppose that the frames of the hive are filled with comb from top to bottom, and from front to rear, without an opening through which a bee can pass. The bees are scattered more or less through the hive. Now let the mercury fall, as it often does in a few hours, to ten or even to twenty degrees below zero, what will become of them?

They must get together in a compact mass, or they must freeze to death. But how can they get together?

Those between the outer combs must go over or under the combs to reach the cluster, and before they can accomplish the journey very many of them will perish. And the same thing will be repeated over and over during the winter. What wonder that by spring they are reduced to a mere handful, or perish altogether?

If there are passages through the hive, many will go out when it is too cold for them to return, though the sun may shine full on the entrance; and the unhealthy may as well die out of the hive as in it, for die they will somewhere.

The margin of profits in bee-keeping is so moderate, under the most favorable circumstances, that to prevent an actual loss no small care is needed. This should be greatest in winter when the risk is heaviest.

THE PROMISED LAND.

THE wanderings of the Children of ISRAEL were but child's play in comparison with the restlessness of a large majority of our American people. The men who pass their entire lives in the country or State in which they were born, never going abroad to seek some "promised land," are so few in number that a phrenologist would at once seek for a large bump on their *caput* known to the professionals as "inhabitiveness." In fact, the restiveness of the Yankee is proverbial and neither poverty nor riches can cure him of this inherent roving disposition. His father or grandfather settled somewhere—perhaps cleared up a large farm—and then moved West; consequently, it's a trait of the "breed" to move when things or surroundings do not exactly suit him.

The lamented GREELEY moved from the home of his youth and in after years, when business fixed him to one spot, he gave vent to the inborn spirit of roving in the well-known phrase, "Young man, go West;" and many a one accepted the advice, whether to his benefit or otherwise. But there is no longer a West of unknown riches and promise, as the Yankee has met the Chinaman on our Westernmost borders, and the tide of immigration sets in from either ocean, and he who resides on or travels to the great "divide" of our Continent, can see hundreds of restless persons going in both directions, seeking the Promised Land, which teems with the necessaries and luxuries of life. That many have bettered their circumstances by these changes of location can scarcely be doubted; but at the same time we think the roving spirit has been cultivated and indulged in long enough for our good as a people; and it is time that a higher appreciation should be placed upon what may be the homestead of a family.

It may be well enough for the boys, if there are several in the family, to push out some distance from home; still, in the case of farmers' sons, they can usually find good locations near the old homestead, provided their education has been of the right stamp. The farmers' son of to-day should, with the aid of all the scientific discoveries made in agriculture during the past fifty years, be able to raise better stock, larger crops, and at less cost than his father or grandfather did from the same land; and if he fails in this, it shows that he fails to appreciate and use the means at his command. Prof. MAPES used to say that every farmer in the older-settled States had a "new farm under his old one," and all that he need do to find it was to put the plow down a little deeper. This theory may not hold good in practice everywhere, but as every farmer knows that a deep rich soil is better than a shallow poor one, he should aim to secure the former whenever practicable.

In the old and long-settled parts of Europe, where the farmers are not looking for some Promised Land when their farms are worn out by injudicious culture, they produce better crops than formerly, and there is no good reason why the same thing should not be done in this country. Of course, we have no objection to men seeking a better locality than the one in which they now reside, whether it be in the East, West, North, or South; but the idea that there is a spot somewhere—if it could only be found—where the highest accompaniments of civilization can be had without labor, is erroneous, and the sooner it is given up the better.

The young man of to-day has only to look about him to find eminently successful men in the various industries, not excepting agriculture, and he may meet them in Maine, Texas, Washington Territory, or in any intermediate locality; consequently, we are forced to the conclusion that the Promised Land is not "afar off," but ever present with those who possess the requisite energy to make the earth yield its fruits in abundance.

Not long since a farmer of poor, despised New Jersey, told us that his farm of two hundred acres yielded him, on an average, two tons of the best timothy hay per acre, and being near market he seldom failed to obtain $30 per ton, and sometimes more for his entire crop. Now this friend of ours has indeed found a Promised Land, and well he knows how to keep it; and there are many others in this happy and enviable position, and more might be if they would!

SOCIAL RECREATION.

THAT period of the year is at hand when outdoor recreation with a large proportion of our readers will soon cease, although their duties may compel them to take abundant exercise in the open air; but, more for profit than pleasure. Earning one's "bread by the sweat of the brow," is a command which is obeyed by more people than are the Ten Commandments." Whether through making a virtue of necessity it is not our purpose at this time to inquire; still, the fact is apparent that many persons work more hours than is good for them, and it is upon such that we urge the importance of social recreation.

In the country especially there is, to use a common phrase, "too little going on" in the way of social recreation and this is one reason so many young men and women look longingly to our great cities as places where they could be amused and instructed. In every school district there should be some kind of a social and friendly society, organized for the purpose of furnishing recreation for both old and young. These organizations should be very cosmopolitan in character; every member recognizing the right of every other member to his or her own individual belief, so long as it does not intrude upon the belief of another. All questions which are likely to provoke controversy ending in ill-feeling, should be tabooed at the start; but it is not necessary to draw the lines so tight or adopt rules so strict as to in any way interfere with genuine social pleasure and profit. In cities, villages and thickly-settled districts in the country, there may be enough persons found of one opinion to make a respectable gathering, thereby avoiding any necessity of adopting rules for preventing a clash of ideas in regard to the character of entertainment given; but in thinly-settled regions this will seldom occur, and the only way to insure harmony is for each and every one to respect the honest convictions of his neighbor, provided they are not in open violation of both law and the rules of respectable society.

Now we shall not attempt to name the kind of organization which would be best, or whether any is needed beyond the bare announcement in a neighborhood that the said neighbors' old and young will meet on a certain evening for social recreation and instructive amusement. In answer to this call, let every one go, and all do their best to make the occasion one to be long remembered. It is not best, in a mixed community, to make such social gatherings all prayer meeting or all dancing, or all speech-making by the village lawyer or minister, but vary the entertainment to suit the taste of old and young, gray and sedate. A man who cannot bend his "dignity" to roll a hoop, or play marbles to please a child, had better step out of the way and make room for more sensible men. Young persons want amusement, old ones instruction; but there is no need of separating the two on this account when seeking social recreation, consequently, we would urge the introduction of amusements of sufficiently varied character to please all, including the gay and giddy, thereby holding them within a circle where their follies may be corrected, instead of banishing them from what is termed the better influence of good society. It requires but a few grains of common sense to manage such matters in a way to make society in the country as pleasant and agreeable as it is in the best circles in cities and villages.

RURAL NOTES.

Pure Milk in Cities.—The noted strictness of the laws regulating the sale of milk in the cities of Great Britain are said to be producing good results and both producers and consumers are alike benefited. The certainty of procuring good, pure milk, encourages consumption of this article, and since the passage of the act prohibiting the sale of adulterated milk in England, the demand has increased in an unprecedented manner, thereby encouraging a corresponding increase in production. This is but a natural result of honesty in trade, and it is a pity that we cannot have similar laws enacted and enforced in this country. Pure milk in our larger cities, at the present time, is a rarity and must continue to be until there is a great change in the administration of their internal affairs. It is bad enough to purchase hay in bales, the center of which is composed of weeds, manure, chaff and similar rubbish; but cheating children by adulterating their food, is too mean a business to be tolerated in civilized communities and should be abated without delay.

Grasshoppers in Minnesota.—It appears from late advices, that the destruction of farm crops in Minnesota during the past summer by the Western Locusts or Grasshoppers, is a far more serious matter than was at first supposed. It is now reported that in some counties there is not grain enough to supply the actual wants of the farmers and their families during the coming winter; and outside assistance will be required to prevent much suffering, if not actual starvation. The ground where the grasshoppers were plentiful is said to be full of eggs, which will probably furnish enough of these pests next spring to take all the early-sown grain and garden vegetables. One farmer of Jackson County says that he has raised but one crop in four years, the Locusts having taken the other three. Under such circumstances, there appears to be but two ways out of the difficulty—either the people must abandon the country, or find some way of protecting themselves against the ravages of these pests.

The Earth's Center.—We have been assured by scientists for many years that the heat at the earth's center is so great that it would melt any known mineral substance; consequently, there must be a vast molten mass beneath us. But now comes Sir WILLIAM THOMSON, who tells us that all this is not true, and that we still have a solid rock foundation, with perhaps small areas of molten fluid. Who knows but that it may yet turn out that "Old Sol" is not a hot planet, but the heat given off comes from some luminous property of the atmosphere which surrounds the sun? It is really too bad to rob us of the belief in a central lava ocean, but we can stand it without flinching.

The Hawaiian Treaty.—For many years certain speculators have been endeavoring to obtain a treaty between the Hawaiian Government and our own, in order to obtain sugar from the former free of duty; this having been obtained, a capitalist more wide awake than his competitors, stepped in and bought one half the crop of sugar for $175,000 and, of course, will reap the benefit, leaving others to make the best of the dilemma in which he has placed them. The production of these islands has, no doubt, been overrated, and no one but a few speculators are likely to be benefited by a treaty with them, no matter upon how favorable terms it may be obtained.

Short-Horn Humbugs.—We notice that some of our contemporaries refer to the great sales of Short-Horns under the above caption. It is doubtless the fact that the ordinary "tricks of trade" are frequently used in disposing of cattle, but it is not fair to apply the name humbug to Short-Horn cattle, for they are a breed too long and favorably known to have their merits questioned at this time. It is very likely that influences have been brought to bear upon some fancy strain of blood to put the price far above intrinsic value; still, it often requires something extraordinary in the way of statements of value to attract attention to real merits.

California Mammoth Trees.—Now the scientists are quarreling over the age of the mammoth Sequoias of California, some trying to make out that there are specimens which are at least 4,000 years old, and others claiming that the biggest of them are only 1,200 to 1,500 years. Well, gentlemen, suppose we cut off 2,000 years from the age of the specimens now living, how many thousands of years did it take to make the soil beneath them, or how long ago were the ancestors of the present race of trees created? The present growth of saplings, however old, are but the descendants of a much older ancestry.

Bergen Co. (N. J.) Poultry Society.—This enterprising young Society will hold its first Fair in Hackensack, N. J., Nov. 22–23. It is expected that some of the finest pure-bred poultry ever seen in this country will be on exhibition, and we bespeak for the organization a liberal patronage. Those desiring to enter fowls for exhibition should address the Secretary, THOS. T. WALTON, Ridgewood, N. J.

RURAL BREVITIES.

EACH subscriber should read the special offer to ladies, to be found on page 288 of this issue. All who are at all interested in plants and flowers will there find something worth their attention.

THE Red Rust Proof winter oats, which for years have been popular in the South, are reported to have "rusted" in Texas the past season, which may be taken as an indication of slight degeneration.

MANUFACTURERS of Harvesting Implements should not forget the meeting to be held at the Centennial for the purpose of forming an Association in their interest. This is a movement which none can afford to neglect.

LORD WALSINGHAM, an extensive land owner in England, has created quite a sensation by declaring that when work is slack and laborers are discharged, those belonging to Trades Unions are the first to receive notice to quit.

WE notice that some of our contemporaries are quoting from a book on grass culture a paragraph where the author says Orchard grass is a native of America. This is an error which might be corrected by consulting any good botanical work.

THIS season's crop of Wild Goose plums seems to be as variable as ever, scarcely any two cultivators of the ever *genuine* sort having the same variety, and the question now to be settled is, who has the original, or is there any one sort entitled to the name more than another?

AN enthusiastic correspondent of the London Journal of Horticulture, in speaking of the comparative value of the Larch and Lime tree, says, "The Larch would buy a horse before the Lime would a donkey," which is an adaptation of the old adage, which reads, "Larch will buy a horse before Oak will buy a saddle."

ROSE ELECTIONS are quite popular in England and do much toward bringing the best sorts into notice. An invitation extended to all rose growers to send in a list of the names of what they consider the best twelve, twenty or more varieties and when all the lists are in the result is published, and this is called a "rose election."

CUI BONO.

WHAT is hope? A smiling rainbow
Children follow through the wet;
'Tis not here; still yonder, yonder;
Never urchin found it yet.

What is life? A thawing iceberg
On a sea with cunning shore;
Gay we sail; it melts beneath us;
We are sunk, and seen no more.

What is man? A foolish baby.
Vainly strives, and fights, and frets;
Demanding all, deserving nothing;
One small grave is what he gets.

[*Carlyle.*

FASHION NOTES.

NEW YORK, Oct. 21, 1876.

OWING to the admirable stuffs and cheap prices now offered in our New York stores, notably at Messrs. LORD & TAYLORS', I have given some illustrations that, I trust, will serve as a hint as to the most appropriate and stylish manner in which to make up your fall wear.

The ladies' polonaise, with basque front and tablier, (No. 4604), is a deep cuirass front and a rounding, wrinkled *tablier* combined. The model shows the use of two materials in its composition, the darkly-shaded portions representing black silk, and the lighter sections a pale lava tint of gray camel's hair, a striking contrast that is very stylish this fall. The basque skirt passes around to the side seams, while the body fits closely and gracefully with two bust-darts and a cross-seam in each front, and the *tablier* has a front or center-gore, with two side-gores that are gathered on the back edges and drawn up high to be united under the polonaise. A vest facing of the dark goods, broad at the neck, curving in at the waist and widening a little toward the bottom in order to gain a shapely contour, is laid upon the lining and met by the light material, which is joined to it by concealed stitches to produce the remainder of the fronts. The bottom of the cuirass is finished with a piping of black silk, and the *tablier* is encircled with a wide silk fold and a fine side-plaited ruffle of camel's-hair. The polonaise back consists of five divisions, the joining seams that descend from the shoulder continuing to the bottom of the skirt. This number comprises the extended side-backs, side-back gores, and one center-form, by which a center-seam is avoided. Black silk serves for the construction of the side-back gores, and the remaining parts are of camel's-hair. The under-arm edges are closed in a seam with the basque, below which the lower part of the polonaise back has a simple hem and depends solely upon its novel arrangement of drapery for additional elegance. It is permitted to hang long and loose on the right, while a shawl-shaped outline is given to the margin of the other side by taking the extremity up to a point higher than the termination of the left side seam, where it is fastened and sustains a rich knot of gros-grain.

The cut paper pattern gives directions that cover all details. It can be furnished in 13 sizes for ladies, from 28 to 46 inches bust measure. Price 50 cts.

The material delineated in the ladies' cutaway jacket with fitted adjustable vest (No. 4595) is *drap d'ete*, but the model is none the less appropriate for heavier cloakings that might be found

4604

suitable for winter wear. The jacket fronts are cut low at the neck, and fall over a high vest-portion, which is fitted by a deep dart in each side and sewed in with the under-arm and shoulder seams. These jacket fronts are straight at the closing edges, but the under-arm seams are curved so as to draw them apart for quite a distance from the closing to the bottom, displaying the vest to good advantage. The back is gracefully adjusted by gores extending to the shoulders and by a curved center-seam. A line of fine silk braid passes about the neck near the edge, and is continued down the jacket front, being crossed and recrossed in basket style to form a square at each corner. It is also carried along the lower edge of the garment, and arranged in a similar square at the center-seam. The sleeve is in coat-shape, quite high at the top, and broad enough at

FIG. 1.

the wrist to pass easily over the dress sleeve, without crushing the trimming of the latter. It is completed with a deep cuff trimmed to harmonize with the remainder of the garment, and the vest is closed to the bottom with button-holes and silk buttons, while the jacket fronts are fastened at their point of meeting, with an ornamental button.

If the jacket is made of smooth-faced cloth, the trimming and vest may be stylishly formed of silk. When suit goods are employed, linings should be used. Silk fringe or *passementerie* gimp is a very fashionable trimming for such garments at the present time, and either of these, or

4595

bands of fur have a rich effect. The pattern is in 13 sizes for ladies, from 28 to 46 inches, and will be mailed on receipt of 35 cents.

Figures 1 and 2 give an idea of the most stylish hats. Description is scarcely necessary, as I only intend these to serve as hints. In my next article I will give a description of new dress stuffs, and more patterns, that must be excluded from this number for want of space. FROLIC.

The Story-Teller.

THE HAUNTED MAN.

IN a whisper, mind—in the gentlest, the most sighing of whispers—I tell you this. In fear and trembling, too, all the time, for *it* might hear me.

You observe, I say *it*; for I cannot apply actual distinction to the weird little entity that torments me. At the same time, though, I find that I have often called it *him* and, in a misty, wandering way, associated the *thing* with the trieksy-looking sprite who stands with his hands upon his hips in the Landseer picture of "Midsummer Night's Dream."

The fact is, I have been haunted for the past five years—I, the simple-minded, calmly living, seventh-rate literary man who pens these lines—and my innocent bachelor life has been made a torment to me by something, of which, as you see, I only dare speak in a whisper.

You are shaking your head! Don't say you are not, for I can feel it mentally; and my perceptions are now those of the most acute. Let me hasten, then, to reassure you—to enlighten you upon the point you are quietly discussing.

No; there has not been the slightest manifestation of insanity in my family.

Again; my pulse gives with calm regularity the proper number of beats to the minute.

My blood is of the normal temperature.

It is not incipient *delirium tremens*, for I was never inebriated but once in my life, and then I was so dreadfully ill the next day that I made a vow, which I have religiously kept, and am always considered an abstemious man.

So, once more, in a calm whisper, I declare to you that I am haunted—bewitched—ill-wished—evil-eyed—overlooked—or in some way suffering from a spell. In fact, there must be something in the matter not hitherto dreamed of in my philosophy and I tremble lest ill should come of it.

But let me explain—let me give you a sample of the kind of annoyance to which I am subjected and during which it always seems to me that I can hear the silvery tinkle of a very small kind of laughter floating about the room.

It was only yesterday that I required my daily remembrancer—the diary in which I record the trifles of my life and note my engagements. It was gone.

That book lies on my study table and I was put out by its loss. I searched book-case, drawers, in folios, among papers, turned out my desk, got into a violent perspiration, went and bullied the servant, rose into a towering rage; and at last, quite exhausted and fuming with annoyance, I threw myself into my chair—and found that diary!

Where did I find it?

I'll tell you. That little book lay in its usual place upon the study table.

Now, you may argue for a week and you will not convince me that some sprite had not hidden that book away until it was tired of laughing at me, when the book was replaced.

Another specimen.

I have a custom, drilled into me in childhood, of carefully folding my clothes before retiring to rest. I never kick one thing here and another there, after the habitude of the reckless, but place each garment ready to be donned in the morning. Now, I am ready to make affidavit that those things are all right at night; but when I have left rising till the last moment, just leaving myself sufficient time to dress and catch the train by which I am going with a friend, there is invariably something wrong. Now it is a button off my trousers. If I get them on and find them all right, the tongue is gone from my brace buckle. Or it may be a stud dropped from my shirt; the button-hole of my collar split; or, more likely, a button grown overripe and ready to drop, swinging only by one thread from the most prominent portion of my coat.

At another time I hear the servant come up with my boots, as I lie in bed. She bumps them down, as servants will bump boots down and, in that pleasant, semi-unconscious way in which one lies of a morning before rising, I seem to see those boots and I wonder whether they have been carefully dried, for the previous day was wet and I have had a horror of damp boots ever since I read somewhere that they were a prolific cause of catarrh. Then I wonder, too, why it is that servants have such peculiar notions respecting the anatomy of the human foot masculine and credit it with abnormally turned-out toes, from the way in which they always reverse male boots—the right on the left side, the left upon the right. They never do so with boots feminine. I lie, then, seeing those misplaced boots there; and when I have made my plunge out, done my tubbing, and have arrived at the stage when I want those boots, I open the door to get them and they are not there!

Now, I am certain that they were there; I heard the girl bring them; but all the same, after a few minutes' interval I ring sharply and the maid comes and knocks.

"My boots!—I'm waitin' for them," I say.

"Plec, sir, they're out here," says the girl, in an ill-used tone.

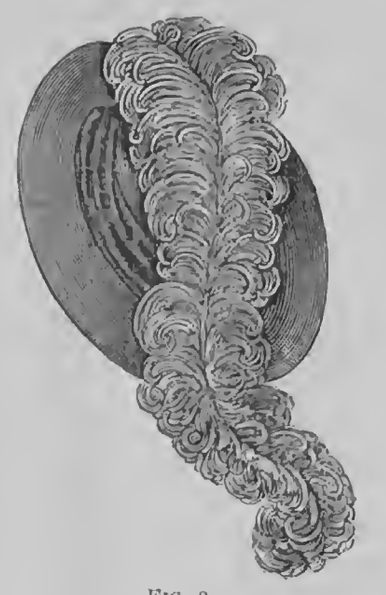

FIG. 2.

Whereupon I go indignantly to the door with a brush in one hand, into which I have savagely driven the fellow brush so that they adhere together, and my hair all down over my forehead.

Yes, there are the boots; and put wrong as to rights and lefts, as a matter of course.

Now, how did those boots get away and how did they come back? For I'm sure the girl did not bring them back this time.

I told you how particular I am about folding my clothes at night. This extends to garments that I do not wear every day—dress coat, for instance, left in the drawer during a tour or shooting expedition.

Now, *it* won't leave those garments alone; and whenever I take them out after absence, they invariably look as if they had been used for the raising of money and suffered from the pawnbroker's roll, so evident too often in the British workman's Sunday coat, which is creased from top to bottom.

There is another way in which I am terribly annoyed. Being a regular 'bus man—of course I don't mean a driver or a conductor, but a traveler by omnibus, from motives of economy, I have noticed the nuisance that the fair sex—especially the fat fair sex, which never travels without a large bundle, which they plant on somebody's knee when entering—is to conductor, driver and fellow passengers, by keeping the vehicle waiting while money is dislodged from a pocket somewhere in the region of folds, or from the corner of a handkerchief, in which it is tightly tied in a knot which won't come undone; while one lady always produces her cash wet—out of her mouth. I have noticed all this, I say, and in consequence I provide myself with a threepenny piece, a fourpenny, or six pence, and place it in my waistcoat pocket ready for alighting and paying without requiring change. Do you think that I can find that coin when I require it? If you do you are mistaken. I grope for it with my glove on; I hunt for it with my glove off; I dodge first in one

4604

corner, then in the other, and each time along the intermediate channel; but no—there is no coin, and the conductor ironically asks me if I want to keep the 'bus all day.

Of course I don't; and I feel very much provoked as I produce my porte-monnaie, drop my umbrella in the muddy street where we are standing, fumble out a two-shilling piece and wait for change, with all the passengers craning forward to look and the driver shouting to his mate to "Look alive, there!"

I get my change—I have already recovered my umbrella—and I bound to the pavement shore, out of the muddy river, after narrowly escaping a run down from a Hansom when, to my annoyance, I am minus a glove and—yes, there it lies, in the middle of the road, ground into the mud by the Hansom wheel.

Of course I have to go on, buy a new pair and as I pay for them, having grown cool in the shop, I mentally say, "I wonder what became of that fourpenny piece," and my hand involuntarily goes to the pocket of my vest and—yes, there it is—I can feel it plainly enough through the cloth.

I merely say, where was that little coin before I mentioned my loss? and that naturally brings me back to gloves—a covering for the hands in which I have been nearly ruined.

With my customary practice of neatness, I double my gloves together, especially the white and lavender kids—which, between ourselves, I always make last as long as possible—and then send them to be cleaned. Now, the home of my light-kid gloves is in my left-hand tail coat-pocket and I fish them out just as I am going into the theater or "at home;" and this is always the case:—I put on one, get it buttoned and am about to put on its fellow, when I find that if it is a white glove *on* my hand, I hold a lavender glove *in* my hand, or *vice versa*. They are sure to be odd ones, and I am certain that I put them away in pairs.

4595

"Why don't I look before I start?" you will say. Because I don't think to look, and one does not feel it necessary after regular precautions. And again I say, How is this?

If it be not the workings of some sprite full of mischief, what is it?

Again, I find myself putting chlorodyne on my handkerchief, because the bottles have been changed; and when, in a fit of passion, I dash down the nasty, ethery, pepperminty pain-easer, take a clean pocket handkerchief and scent that, I find I am doing it with the tincture of myrrh, or the gummy stuff the fellow bored me into buying when last my hair was cut.

Only a week ago I had my breakfast spoiled by a letter which came by post. It was as follows and there was an inclosure:

No. 12 JERMYN ST., Friday.

SIR:—I am at a loss to understand the meaning of this note and I should be glad if you would explain, for I am a man who makes it his rule neither to borrow nor *lend* money. If you had any ideas of the latter kind in sending it, believe me that a frank request would have been better. I am your obedient servant,

J. WELLSBY PURNOW.

TO T. WOOLLY, Esq.

I was amazed and sat with the note in my hand, unable to comprehend it. I had asked Purnow to come and dine with me at the Curacoa Club and wouldn't have asked him for money for the world. Besides, I didn't want any—just then.

At last, by way of solving the mystery, I took up the inclosure, to read, in my own hand:

No. 144 BYE ST., Monday.

DEAR OLD BOY:—Let me have that ten pounds, there's a good fellow. You promised it before Christmas and it's now May. Time,

T. WOOLLY.

Yes, I wrote that; but it was to Jack Snorter, who owes me no end of borrowed money, which I get back a little at a time. But how did Purnow get it? Stop—no—yes—no—to be sure I did. I wrote to both at the same time and the notes must have been put—yes, I deliberately say in a whisper, mind—*put* in the wrong envelopes!

I was aghast for a time—it seemed so horrible; but at last I recovered myself sufficiently to take my hat and got to the telegraph office to send a message to Purnow, telling him it was a mistake and that he must come directly, for I had ordered a capital dinner at the club.

I got that message very cleverly within twenty words, got out a shilling and was just going to hand both to the pleasant-looking young telegraph clerkess, when a horrible thought ran through me like a chill and I stood as if transfixed. Jack Snorter had got Purnow's note and *he* would come to the club to dinner! Worse still, to me, as we sat together with coffee and cigars, he would borrow another ten-pound note of me, or perhaps be kind enough to take it in two fives.

What was I to do? I dare not bring those two men together. I did not want Jack. Oh! It was dreadful. But the dinner was ordered and might just as well be eaten; so I went away—making the pleasing-looking young telegraph clerkess look upon me as very strange in my ways—and wrote an explanatory letter to Purnow, appointing another day for the dinner; but he declined to come, and I feel sure he believed my note to be a try-all for money.

But Jack Snorter came and ate my dinner; and as I said, so he did—he borrowed two fives over our coffee, which sum he will never pay.

It's an awful position for a man to be in, and I suffer from it at every turn. I have found my gun unaccountably rusty; my fishing lines horribly tangled and my top joints broken. I have found my choice cigars moldy, my soda water without a fizz left in the bottle, my tea disappear; and the number of umbrellas that have deliberately gone away, I dare not enumerate, for my sake—not yours.

Enough. I am the Haunted Man, and my sprite will not leave me. He puts fuel in my pockets, rubs my hat nap the wrong way, blunts the edges of my razors, breaks the teeth out of my comb, and in one way or another reduces me into the state of a hypochondriacal dyspeptic. As before said, I tell it you in a whisper, lest evil should come upon me seven-fold; for mine is a malignant sprite and to you, good reader, I wish a happier fate.

Ha, ha! By Jove, what fun! I've just turned this out of my desk, where it's lain for six months. I meant to send it to a magazine, and here it goes at last, if any one will have it. But, I say, the spirit's exorcised; gone, vanished—everything's in its place and there's a place for everything. Apple-pie order and sunshine; unity, peace and concord. *E pluribus unum—Hont soit qui mal y pense—Deus et fatamen!* Excuse my high spirits; it's all due to St. Lydia, who took pity upon my forlorn lot and married me, driving all sprites away.

I say, though, only think! Jack Snorter has come in for a plum and no sooner did he hear that I was going to be married than he clapped a check for a cool hundred into my hand, saying that he didn't know how we stood, but we'd cry quits and that would pay the trip.

This comes unknown to St. L.—*Once a Week.*

ARTISTS' MODELS.

IN his own mother Raphael found the model for his unsurpassed maternal creations. The Fornarina was his model for the possessed boy in the "Transfiguration," and her image is recognized in others of his works. Michael Angelo, for a figure which Charon is driving from his back into Hades, finds his model in one of the cardinals—one of his greatest detractors and bitterest enemies. Andrea del Sarto and Correggio are said to have painted their Madonnas and angels from their own wives and children. Leonardo da Vinci chose as his model for Judas an ill-favored man in power who was trying to ruin him. The sister of Napoleon I. was a model to Canova. The distinguished poetess and noble princess, Victoria Colonna, it is said, influenced Michael Angelo in his type of female heads.

Among the old painters, had I space, I could find pages of similar instances, if I chose to consult historical references. Of the modern painters I have room for only two instances, though hundreds could be found if desirable. Trumbull, who went to England during the War of Independence, was thrown into prison as a spy; during his imprisonment he occupied himself in painting a picture representing the sortie of Gibraltar. Among the principal foreground figures was a young English officer, wounded and dying. The artist found it difficult to satisfy himself with the action of this figure. Sir Thomas Lawrence, then commencing his career, came one day to the prison to visit the rising American artist. Trumbull expressed his dissatisfaction in regard to that particular figure, when young Lawrence threw himself into the action of the wounded Briton. The artist, pleased with his pose and form, painted from him the most touching incident in that remarkable picture, thus profiting by Lawrence as his model and perpetuating a portrait of him at the same time.

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 269.]

NEBRASKA.

BY action of Congress in 1854, the Territory of Nebraska was formed, covering the area between latitudes 40° and 43°, and from Minnesota and Iowa west to the Rocky Mountains. From this was set off in 1861 to Colorado, the portion west of longitude 104 and south of latitude 41, and to Dakota all above latitude 43 and the Niobrara River, and to it was added a triangular piece bounded by the Rocky Mountains, latitude 41° and longitude 110°. In 1863 there was set off to the Territory of Idaho the parallelogram bounded by the 41st and 43d parallels and the meridians 104 and 110. This left the Territory with boundaries as follows, viz.,—north, the 43d parallel and the Niobrara River; east, the Missouri River; south, the 40th parallel to longitude 102 and the 41st parallel between the 102d and 104th meridians and west by 102d meridian between longitude 40 and 41 the 104th°, between longitudes 41 and 43—which, in 1867 having complied with the requirements of Congress, became a State.

COLORADO.

As early as 1858 the discovery of gold in the vicinity of the present site of Denver induced immigration to this part of the public domain, which increased rapidly and in 1861 the population had become so numerous as to render it advisable to organize a Government, which was done in 1861. A Territory was formed, comprising such portions of the then Territories of New Mexico, Utah, Nebraska and Kansas as were included between the 37th and 41st parallels of latitude and the 25th and 32d meridians of longitude. Subsequently, several attempts to frame a State Constitution were made and petitions for admission to the Union were sent to Congress, but all were without effect until the present year, when Congress passed an act which, being ratified by the people of the Territory, Colorado became a State on the 4th of July, 1876.

NEVADA.

In 1861 a portion of the eastern part of the State of California and that part of the then territory of Utah west of the 38th meridian, were given a Territorial Government and named Nevada, and in 1864 it was made a State, to which was added in 1866 another portion from Utah and also about 12,000 square miles from Arizona. This left the State with its present boundaries, viz.,—north, the 42d parallel; east, the 114th meridian and the Colorado River; and south and west a line drawn from the Colorado River in latitude 35, to Lake Tahoe in latitude 39; thence north on the 120th meridian to the 42d parallel.

It is proper to remark that California has not yet ceded that portion of Nevada that was formerly included within her boundaries.

DAKOTA.

In 1861 all the public domain between the western lines of Minnesota and Iowa and the Rocky Mountains lying north of the present State of Nebraska and of the 43d parallel west of longitude 104, was constituted the Territory of Nebraska. By the formation of Idaho, Montana and Wyoming at different times, the area of Dakota was successively diminished, enlarged and again diminished by changes in boundary lines too complicated to be easily described or readily understood without diagrams. The present boundaries of the Territory are—north, the 49th parallel; east, the western lines of Minnesota and the Big Sioux River, dividing it from Iowa, south by the Niobrara River and the 43d parallel and west by the 104th meridian. There is also belonging to Dakota a tract of about 2,000 square miles lying west of Wyoming in the northwest angle formed by the 44th parallel and the 111th meridian.

ARIZONA.

In 1863 that part of the Territory of New Mexico south of latitude 37 and west of longitude 109, was erected into a separate Territory and named Arizona. Subsequently, in 1866 that portion of the Territory west of longitude 114 and the Colorado River was detached, becoming part of Nevada.

IDAHO.

The Territory of Idaho, as constituted by act of Congress in 1863, included all that portion of the Louisiana cession lying between the eastern boundaries of Washington and Oregon and the 104th meridian, together with the area lying between the 41st and 42d parallels and the 106th and 110th meridians. The boundaries of the original territory have been changed at various times. As now constituted, it is very irregular in form, having for its boundaries on the west longitude 117° 04' and the Snake River, touches the 49th parallel on the north to longitude 116, then on that meridian south to latitude 47 45, thence following the course of the Coeur d'Alene and the Bitter Root and the Rocky Mountains through their various curves and windings, till they reach the 111th meridian in latitude 44 32; thence down that meridian to latitude 42, which parallel forms its southern boundary. This irregular boundary was made from the fact that the mountains on the easterly side are almost impassable.—[To be continued.

The Literary World.

THE NOVEMBER MAGAZINES.

HARPER'S.—The current number fitly closes the LIIId volume, and the prospectus of the succeeding volume is replete with attractions which, we doubt not, will be more than realized by fortunate subscribers. The initial paper in this number is a handsomely illustrated fairy tale—Magnus and Morna—by Mrs. MULOCK-CRAIG. Next following is an article on Mediæval Furniture. A Puritan Gentleman in New England is descriptive of the life and career of JOHN WINTHROP, and in An English Woman among the Himalayas we have a pleasant narrative of travel. The short stories are not as good as usual, but the serials maintain their interest. This is especially true of A Woman Hater; quite the most brilliant novel of the day. Mr. CURTIS in his Easy Chair is as felicitous as ever, and the Drawer is a perpetual warning to sour dyspeptics.

SCRIBNER'S.—We are not as yet sufficiently calm and in our usual editorial mood to speak rationally of this magazine. How any one can resist the exquisite illustrations and the appropriate letter-press that accompanies them is beyond our ken, as is also the conundrum, How can they make such a book for the money? The leading paper is by C. H. CLARK on The Charter Oak City. Well,—well don't listen to our maundering but buy the magazine, and read an instructive paper on The Beginnings of Life, and after admiring Pictures from Rome, just say if you can how it is that Dr. HOLLAND contrives to bag such capital short stories. The poetry is plentiful and above the average, and if any one can read in Bric-a-Brac, the touching story of The Fair Isolinda, whose fame it was

"—— the young Oronoco, in doublet and hose extensive,
Who stood by the grim portcullis with mien extremely pensive.
Yes, stood by the castle moat, as handsome as one could wish, with
A gilded dagger in hand, that he haughtily cleaned a fish with."

without a feeling of "contemporaneous human interest," then he is base indeed! Altogether this number is charming, and if you mean to do without it, we can only reiterate Punch's advice on another occasion,—"Don't!"

ST. NICHOLAS.—The girls and boys have the usual feast of good things spread before them, with a promise of more of the same kind to follow.

ATLANTIC.—Mr. HENRY JAMES, Jr., continues to make his serial, The American, most absorbingly interesting. It is a pure luxury to revel in the language, alone. An Old Woman's Gossip is assuredly very pleasant reading. Would there were more "old women" like FRANCES ANNE KEMBLE, and that Mr. HOWELLS had a reversionary interest in the labor of their brains! The Ascent of Takhoma, Miller Michel, The Battles about Atlanta, In Two Worlds, Pottery at the Centennial and other papers go to make a number that yields profitable as well as pleasurable reading.

GALAXY.—Those who vainly imagine that a magazine cannot be made interesting without the aid of pictures should buy the November Galaxy. Its conductors well maintain the spirit of its name, by keeping in their firmament "stars" of the first magnitude only. Mr. COAN tells all about Fighting by Machinery, and if warriors could only be molded as are bricks, the Peace Congress might appropriately delights in war. Strange to say, this magazine has omitted something seasonable about household art. Queer that they, too, have not seized a copy of Violet-le-Duc and expatiated on hard-seated, stiff, straight-backed chairs! We yearn for more information concerning a fireplace that would serve equally well for a barbacue or blast furnace. J. G. SWISSHELM speaks of American Character, and R. G. WHITE contributes his second paper On Reading Shakespeare. The Silent Wooer becomes audible, and Mr. RHODES asks What Shall We Eat? FANNY R. FEUDGE has something to say of Oriental Legends, and the Editor's Ideas are quite luminous as seen through the Nebuke.

Sabbath Reading.

CHURCH MUSIC.

SOFT, through the rich illumined panes,
All down the aisle the sunlight rains,
And sets in red and purple stains.

And mid this glory from the skies,
We hear the organ-voice arise,
Its wings the waking spirit tries:

It flutters, but it cannot soar.
Oh! heavenly music, let us pour
Our woes, our joys, in thee once more.

All wilt thou take. Thou mak'st no choice,
Hearts that complain, hearts that rejoice,
Find thee their all-revealing voice.

All, all the soul's unuttered things
Thou bearest on thy mighty wings
Up, up until the arched roof rings:

Now soft—as when, for Israel's king,
Young David swept his sweet harpstring:
Now loud—as angels antheming.

Oh! tell what myriad heads are bent.
Oh! tell what myriad hearts repent.
He will look down: He will relent.

It dies. The last low strain departs.
With deep "Amen" the warm tear starts.
The peace of Eden fills our hearts.

[*Katherine Saunders.*

UNSELFISHNESS.

IT is difficult to find in these days of bustle, crowding, money-making and money-spending a thoroughly unselfish person, one who thinks more of his fellow-man than himself; who stands ever ready to assist the poor, raise the fallen, cheer the sick and comfort the sorrowing, and yet it seems to me that there cannot be a more desirable disposition or more lovable character; this would be a very different world if the spirit of unselfishness were thoroughly and extensively cultivated. There would be more charity for the sinner, more prayers for the straying, more Christian love, more filial devotion, more tender mothers, more home-loving husbands, less delight in scandal, more horror of guilt and pity for the tempted.

How the dark places of life would brighten, and paths never known to sunshine and virtue gleam with awakened radiance were the world to grow and blossom with the plant of unselfishness. True, it is here we see the fruit sometimes, and not always in the rich man's palace. There are plain, verdant Irish girls toiling in our kitchens who might well set before us examples of unselfish devotion. Have you ever noticed how the hard-earned wages of some unlettered servant-girl just from Ireland are hoarded up to be sent to the absent parents in the "ould counthry?" how she will deny herself many a needful article in order to send the money to the loved ones?

Not he who gives the most to the Church, or subscribes loudly in causes of charity, whose name is praised for his benevolent gifts, not he always possesses in its serene purity that pearl of great price, unselfishness. See that lonely woman in yonder tenement house, watching over a sick neighbor in the silence of the night, when the world is asleep and unconscious of the waves of sorrow rolling over it—expecting no return, for her neighbor is as poor as herself. She will receive the reward at last, when perhaps, the giver of thousands will be classed among the selfish ones of earth. I suppose a mother's love for her babe approaches the nearest to our ideal of unselfish human affection. What sacrifice will she not make for her child, the little helpless being that can give no return? When pain enwraps its little frame, how strong she is to carry the poor, suffering one, hushing in her never-wearying way the pitiful cry of distress; no thinking of self then; that thought comes when care and watching avail no more, and she sees her darling lying in its coffin, the baby soul gone home to God, to a deeper, sweeter love even than a mother's.

In traveling through Oriental lands one would readily suppose, after a brief sojourn in Egypt, that the natives were wholly and completely engrossed in self, for the incessant cry of the Arabs in the street is "Bakshoosh;" it meets the foreigner on his first arrival in the harbor of Alexandria, follows him to the thronged bazars and narrow streets, assails him on the banks of the Nile, rings after him on the steps of the Mosque and summit of the Pyramids, and mingles with his memories long after the Egyptian shores have faded in the past. But those who have had a longer and more personal acquaintance with the inhabitants of the land of the Pharaohs, know that they never let a fellow-being go hungry; they share their humble meals with those poorer than themselves, and if the parents of a child die, some woman, generally a childless one, comes forward and adopts the little one as her own. They have no need of orphan asylums on the banks of the Nile. While the people are thus unselfish with each other, they will call for a "present" the moment a foreigner shows his face or his purse.

Exalted above all other pictures of unselfishness to which the world can find no parallel, is that of Christ's life and death on this selfish earth, leaving us such an example of perfect unselfishness as no human power can surpass. With such an example before us, how can earth bring forth so many barren souls—murderers, drunkards, liars, forgerers, misers, scandal-lovers?

Would that we might take this divine pattern more into our hearts, and so shape and mold the restless course of our lives that they may grow more and more like the blessed original given us to imitate, even the Redeemer of the sons of men, our guide to a path of pure, cheerful Christian unselfishness.—*Sara Keables Hunt.*

Ladies' Portfolio.

ONLY.

ONLY a blonde head resting
Quietly here on my breast,
Only two blue eyes gazing
Into those they love best.

Only a soft sigh breathing
Out from those rosy lips,
Only a small hand pressing
Mine with its finger tips.

Only a slight form nestled
Close to the one it loves,
Only two mortals cooing
And billing like turtle doves.

Only the moments flying
Swiftly and surely away,
Only the silver moments
That make up the golden day.

Only a small note written,
Then a little sigh;
Only farewell, and darling;
Tear-drops—then good-by.

MAPLE BUDS.

No. VI.—The New Family Bible.

BY MAY MAPLE.

"I WANT to show you our new Family Bible," said Mrs. HARPER to her Aunt RUTH, as she unrolled the elegant volume from a snowy napkin. "Did you ever see such fine engravings; besides, here are notes and references, to make the mysterious passages all plain.

While they were admiring the fine plates, little JOHNNY came in from his play, and asked his mother to allow him to see the pretty pictures.

"No, no, JOHNNY; you cannot have this book. There is an old book that has pictures enough for one little boy. Now you need not go off crying about it—if you do I shall certainly punish you," said the mother, who really had not the least idea of being unkind.

"Why not let the child look at the volume a little while?" said Aunt RUTH. Mrs. HARPER gazed at the speaker with an air of the most profound astonishment.

"Why, Auntie! you don't mean me to infer that you would let a ten-year-old boy have such a book to amuse himself with?"

"Most certainly I do."

"Why, that book cost my husband $12. Rather too expensive a toy for him yet. It would not be a week before he would have it all pinned up on the wall."

"Then I fear you have not used your parental authority. A child of his years certainly ought to know better than to spoil even a primer."

"Well, he does know better and, in fact, has every one of his gift books in as fine order as when he received them, although he reads them frequently. But the idea of letting him have anything so expensive as our new Family Bible, is perfectly preposterous."

What is the use of those Family Bibles? Is a question I often ask myself. Almost every third family is in possession of one of the splendid volumes. Not one in a dozen is ever opened except for exhibition, or to have the family record filled out by some ornamental penman.

Year after year it lays rolled up in a napkin put far away in some private drawer; or else it is placed exactly in the middle of the marble-top center table in the darkened parlor till mildew, dust and rust corrode the gilding and the binding becomes food for moth. One might better take the bread and butter from the children's mouths and let them live on cannaille than to keep those illustrated Bibles from them. Those steel engravings reveal stories of those early days, that are quite as attractive and far more instructive than those fictitious narratives of the "Arabian Nights" and ÆSOP'S fables.

Parents say the children can read the old books; and so they can. But go where you will, neither parents nor children read the old books with such a living interest as they would the new one that contains correct representations of the country KING DAVID inhabited; and the wayside notes and comments of the region round about Jordan, where "HEROD diligently sought the young child's life," and the hills where the shepherds watched their flocks by night and beheld His star in the East.

Many a child will have reason to testify against the parents who have loved him fondly but not wisely, for his utter ignorance of the laws of GOD. The light that would have guided him safely to the haven of eternal peace, has been hidden from his sight, and when he has asked for bread *a stone has been given.*

CARE FOR YOUR MOTHER.

BY BELLE WAFFLE.

YOUNG lady, don't dwaddle in the parlor, spend your time in fooling and flirting with the soft-headed, soft-hearted young FITZFOODLE and weep over the imaginary trials and sufferings of the never-was, never-to-be-heroine of the last novel, while your poor, weary, worn-out mother is drudging her life away in the kitchen, unwept and unthought-of. Don't dress yourself up in fine laces, silks and muslins, while she wears old faded calicoes. Don't take all the holidays and pleasure trips and leave her none. Don't turn up your nose, toss your head, or make unkind remarks at her old-fashioned ways and notions and keep her out of the room when your friends call and you have music, games and jollity. Do you never think who it is that keeps you in your finery and idleness? that sees that your wants and wishes are complied with—that everything is in order and readiness for the pleasure and privileges which you enjoy? Ah, the time is coming when you *will* think! When you have taken upon yourself duties and responsibilities of which you know nothing, and have gone away among strangers to struggle with your ignorance and inability; when you stand beside a still, cold form, with the tired hands folded forever, in rest, your thoughts will be full of the past, and your soul will cry out in agony for your mother.

Young man, don't lounge about and let her do all the chores herself. When she bids or admonishes, don't strut away as though her words and wishes were not worth minding. Don't speak disrespectfully of her to your companions and call her "the old woman." Don't take all the silly, simpering, do-nothing young ladies of your acquaintance out riding, to the lecture, concert or theater, and swell up with indignation at "the idea of taking *her*."

No matter how tall or how wise you have grown, you are her boy, her child still, and she still thinks of you, cares for you as no other can or will. If you were to leave the home-roof and set up in business for yourself, she would watch you rise or fall with an interest or anxiety no other would have. If you were overcome by adversity, trial or temptation, or deep in sin, misery and wretchedness, and all the world had turned against you, *her* heart would still be open to you, ready to take you back and let you begin over again. If you were prostrated by sickness and Death hovered over you, she would watch with and wait upon you, would fight back the grim monster as no other would. Oh, young man, *care for your mother!*

PUBLIC SUICIDE OF A WIDOW IN CHINA.

THE Overland China Mail gives an account of a strange suicide which was lately committed at Fuh-chow Foo. It seems that a young lady, an inhabitant of that city, who had the misfortune to be left a widow while yet in her teens, was urged by some injudicious relatives to enter again the bonds of wedlock. The thought thus suggested of supplying the place of her late husband was so repugnant to her feelings that, in order to escape from the persecution of her advisers, she determined to "ascend in heaven on the back of a stork," or, in other words, publicly to commit suicide.

Having arrived at this determination, a day was set for the ceremony. Early on the fatal morning the lady, dressed as the Queen of Heaven and surrounded by a large following of admiring relatives and friends, started from her late husband's house in an open sedan chair for the scene of her self-inflicted death. By the way she visited her parents, to bid them farewell, and stopped occasionally on the way to taste the viands which were placed at intervals by the side of the road, as at a funeral. On arriving at the open space at the back of the Hai-chaou Temple she mounted on a scaffolding which had been erected for the purpose, and, having bowed to the vast crowd which had assembled to witness the proceedings, she cried with a loud voice, "Heaven and earth, and my friends! I am quite satisfied to die in this manner."

Having said this she stepped onto a chair on the platform and thrust her head through the noose of a red cord, which hung suspended from a cross-beam above her. At the same moment a red cloth was placed over her head and face, and then, without the least hesitation, she jumped off the chair. Death was almost instantaneous, and she expired without the least apparent struggle.

Unfortunately the effects of this young lady's self-devotion did not end with her life, for so deep an impression did her conduct make on some boys who had witnessed the spectacle that they amused themselves on the following day by making believe to follow her example. By a misadventure, while one of them was adjusting the rope round his neck, his playmates ran off, and on their return they found that he likewise had "ascended to heaven on the back of a stork."

"DUAL GARMENTURE."

THE Free Dress Reform Club of Philadelphia has boldly declared that "The garmenture for women's legs should be of dual form." And then there would still be the same old formal duel who should wear the "garmenture." And the Reform Club did not settle the question whether this "dual garmenture" would be fastened around lovely woman's waist with a pin, or held in place by a suspendature. Nor did it resolve that the buttonature of women's dual garmenture should be kept in a more perfect system of repair than is the case with the more manly trowsature. And, if the Reform Club adopts the style of garmentature worn by the sterner sex, they will have to fly a balloon jib art to accommodate the bustleture.

AMONG the really useful women of the age may be mentioned Mrs. Vansittart, of England, a daughter of Lowe, the inventor of the screw-propeller. She exhibits the "Lowe Vansittart Screw-Propeller" at the Centennial Exposition, which she advertises as the "non-vibrating, full-backing," as fitted by herself for the British navy and merchant service.

A PARIS fashion writer describes a ball dress made entirely of flowers. The garment is really an overdress, although it is so long as nearly to cover the other. From beneath the edge falls some drooping flowers, like fuchsias, and covering the upper part, generally made of muslin, are flowers of one species, or mixtures of all kinds.

Reading for the Young.

WHAT THE OWL KNOWS.

Nobody knows the world but me;
When they're all in bed I sit up to see;
I'm a better student than students all,
For I never read till the darkness fall;
And I never read without my glasses,
And that is how my wisdom passes.

I can see the wind. Now who can do that?
I see the dreams that he has in his hat;
I see him sorting them out as he goes—
Out at his stupid old trumpet nose.
Ten thousand things that you couldn't think
I write them down with pen and ink.

You may call it learning—I call it wit.
Who else can watch the lady-moon sit
Hatching the boats and the long-legged fowl,
On her nest the sea, all night, but the owl?
When the oysters gape to sing by rote,
She crams a pearl down each stupid throat.

So you see I know—you may pull off your hat,
Whether round or lofty, or square or flat—
You can never do better than trust to me;
You may shut your eyes as long as I see;
While you lay I will lead you, and then, I'm the owl,
I'll bury you nicely with my spade and shovel.

[George Macdonald.

FAMILIAR SCIENCE.

No. 2.—The Oak Pruner.

MY DEAR NEICES AND NEPHEWS:—Our last talk was about infusoria, those minute aldermen of the sea, the polyps, and I would fain believe that

the brief outline then given has led some of you to investigate the subject. It is a specially interesting theme at this time, when we are all talking of reform. The polyp is the greatest reformer in existence. You may cut him in two and he reforms, or you can continue the subdividing process indefinitely, and the little brute goes about his reformation work without preamble or resolutions.

Now the accompanying picture tells the story of our friend, the Oak Pruner. He is what you might call an optimist among beetles—that is, he takes a serene view of life and believes in the greatest good to the greatest number—but I should add, perhaps, that his idea of the greatest number is No. 1. How closely he does resemble some of our friends!

It is scarcely courteous to proceed further without introducing the young fellow in due form, so I hasten to present to the Young Folks Mr. ELAENIMON VILLOSUS. You would suppose from the name that our friend was not an American, but he is. This name is merely a piece of foreign affectation that it pleases him to assume. It is even hinted that it was Mrs. E. VILLOSUS that put him up to the caper, and that at home, among their friends, they are known as "those PRUNERS," with a sneering inflection on "those." I will go even to greater lengths and state that farmers have been heard to say, when viewing his ravages, "Ah, ha! PRUNER, old boy, I have thee foul." It needs no explanation to show that such a sentence is malicious in tone. Why should it be? I will tell you.

The piece of wood you see in the cut is a part of the branch of an oak. It was sent to the RURAL Office by a subscriber who wanted to know what it was that caused such tremendous destruction to his trees, whereupon Mr. FULLER, your Editor-in-Chief, went to his Entomological cabinet, produced the miscreant, and I have had him reproduced from life for your instruction and pleasure.

It would seem that our friend has substantial tastes, as he chooses oak timber for his domicile. In its adult state the Oak Pruner is a slender, long-horned beetle, just as you see him, and his size corresponds to the scale that runs parallel to the cut. He is a fastidious dresser, affecting quiet colors, dull-brown, sprinkled with gray spots composed of very short close hairs. He is not quite as tall as a steeple, varying in length from four and a half to six-tenths of an inch. But the mischief he can do!

About July, Mrs. E. VILLOSUS gladdens the heart of old PRUNER by intimating that, perhaps, it would be quite as well to look for some suitable dwelling for their son and, presto! one fine day a tiny egg is deposited close to the joint of a twig or a branch. His grubship is thus set up in business for himself and soon he penetrates to the pith and continues his course to the trunk of the tree. The grub is that quiet, slippery-looking fellow up in the right-hand corner, and you can judge of his boring capacity by looking at the hole in the branch. He devours the pith and, ungrateful youth, there are good reasons for believing he does not give even a passing thought to his parents!

Towards the end of summer he concludes to change from a grub to a pupa—that is, he becomes a sort of half-and-half between a grub (as shown in the upper right corner) and a full-fledged beetle, as seen to the left. And now a momentous question presents itself. This timber merchant will want to go down to the ground shortly, but he don't care to leave such comfortable quarters. How does he do it? Why, he quietly eats along until he reaches the stem of the tree and gnaws away until he leaves only the rim of the bark untouched; then leisurely retreating, he makes himself comfortable *inside* the branch and whistles for a wind, which comes along presently and, of course, precipitates the branch to the ground. The leaves break the force of the fall and behold! our friend as snug as a bug in a rug, until he gets good and ready to emerge in the spring. The consequence is, branches of five and six feet in length are thus severed from vigorous trees and incalculable damage done. Now with this brief description of one insect injurious to vegetation, see if you cannot go out in the woods and detect E. VILLOSUS at his tricks, and by gathering up the branches and using them for fuel, cremate his beetleship and prevent a repetition of this two-act comedy in the spring. UNCLE TRUE.

LETTERS FROM BOYS AND GIRLS.

What!—Suppress Him!

RESPECTED EDITOR AND THE RURAL CAMP FRATERNITY:—After reading the two columns of the Cousin's letters in a late number of your journal, after perusing the letter of YOUNG POET and some various sentiments about quilting, (if another "I" had been substituted for the "t," I would have been more interested,) and after wading through the comments on the letter of YOUNG EDITOR published some time since, I have the audacity—yes, really—to write this epistle. I say audacity, because it rarely happens that you can call out any of us junior eds., because we're afraid some of your sharp-witted critics might undertake to overhaul us about some unsuitable expression in our letters. But I cannot keep still without going into the war and striking out. So I've put my musket on my shoulder, a quill behind my ear, and with a few *Italic* (I want to be *emphatic*) type in my pocket,—I'm here. Now, dear Cousins, don't think I am imposing upon you, for really I am a disciple of *black ink and lye*. No, I'm not a "devil" in a down-town job office, but actually have a sprightly sheet, which shows its beaming countenance every month. But just as I shake your hands I must depart. Will call again.—YOUNG EDITOR No. 2, *Typeville, State of Literati.*

P. S.—Won't UNCLE TRUE give us another exercise to compete for a prize? We latent fellows will do better next time.—Y. E.

[Now here is a young fellow after his Uncle's heart. How lively he would make it for a hornet's nest! Neices, up and at him! Don't tolerate this departure from the beaten path.]

"Storm," and Some Thunder.

HELLO, boys! Wake up! what are you all about? Why don't you write oft'ner? I've been reading the "Letters from Boys and Girls" for some time. Some of them I like very much, but others I don't like at all. This is the first letter I have written to the RURAL, so you see I'm a stranger among you. I don't mean to describe myself. If any of you have any curiosity as to what kind of a boy I am, however, just look at the description of BELLE E. F. in the RURAL of September 9th, and you will have me exactly. I like her letters, as also ONE OF THE BOYS, very much. I also hope the latter will not permit the girls to quiet him if they *should* put on the war-paint. Advise him to fire back every time. They can't do him much harm, any way. I hope BELLE E. F. will give us another of her red-hot letters. A few more like hers would make our little column so much more interesting. At present, the boys and girls, when they write something about somebody else and the party takes it up and fires back, the former thinks he has got the worst of it and draws off, and that is the signal for every new beginner and, in fact, for almost every one that writes, to have a crack at him. Now boys, when the girls find fault with anything you write, don't stop, but write again. No difference if you do get a little snubbed, the boys will take it up and give the girls as good as they send, and increase the interest of our column at the same time. I'm sorry none of the boys wrote about JOAN OF ARC. I agree with ONE OF THE BOYS in saying that the boys could beat any of the histories written by the girls. I hope UNCLE TRUE will give us another chance. I might perhaps have made my letter look better if I had said something about YOUNG TOM OR YOUNG BACH; but as that subject has been worn about out, I guess I can do without it. I don't want to be one of the Cousins—*they agree too well.*—STORM.

[Here is a young gentleman who is a born agitator. Water will never stagnate as long as he has a pole! I don't feel encouraged to give out the subject for another sketch, in view of the fact

that neither girls nor boys have shown any disposition to correct the errors or judge of the merits of those published.—U. T.

Hoop La!

DEAR RURAL COUSINS:—Uncles MARK and TRUE, jointly and unconsanguineous-like, have discarded one of their young. They have slighted his MS. in *two* cases, extraneous alike to the present fullness of soul that induced and blended them and to the ties of filiation which bind us together in cousinhood; and therefore I submit this attestation of their alienity towards me to your sympathy and ask whether I should "advertiz 'em," as the Michigan man once threatened the American Agriculturist with for finding in its columns a spurious and fortuitous advertisement. However, in looking over the annals of paternity, more than one kinsman is found who neglected nearer and dearer relations, and therefore if they publish this I will forgive Uncles MARK and TRUE. Unlike the majority of you RURAL readers I am a city pumpkin, playing my part in the theater of life in this busy "Babylon," but have a princely garden where nature not only sheds the usual refulgence of temperate climates, but has also hills and woods and orange groves, like those which formed the unrivaled landscapes of Granada—but it is in my brain.—W. C., *New York*.

Why Not, to be Sure!

DEAR RURAL:—I have been watching the letters from the Boys and Girls for the past five years with great interest, and I am sorry to say I rarely see one from a Canadian. I do not know the reason of this, but probably they have been like myself, always waiting for some one to start first. Now I think we have some young folks in Canada who are as capable of writing a short essay as the Americans, although they are sometimes styled "slow Canadians." Have any of the RURAL Cousins ever visited the Dominion? If so, I would like to have them tell what part. I live in the County of Elgin, twelve miles east of St. Thomas. I was disappointed about going to the Centennial, so if any of the Cousins have been there, we would like to have a description—or probably UNCLE TRUE will favor us. If this merits a place in your valuable paper, I will write again. Hoping you will initiate me as one of your Cousins, I am —D. B., *Aylmer, Canada*.

A Resolution and Question.

DEAR UNCLE:—We just received the RURAL tonight and I made up my mind that I would certainly write now, as I have written two letters and neglected to send them. We do not take the RURAL, but are members of a Reading Club and therefore have the use of it. I think Cousin GYPSY BELLE is just right about piecing quilts. I have pieced five and think of piecing another. I should like to ask ANNA MCM. how she occupies her time after school, and in winter? I would say to the Cousins that the boys thought they could not write about JOAN of Arc *any better*, and so they kept silent. Isn't that so, Uncle TRUE? Will some of the Cousins tell me how to prepare autumn leaves for bouquets, please? I am sitting by the south window, the sun is just setting and the clouds are tinged with gold and look beautiful.—FLORENCE DELANO, *Iowa*.

The Puzzler.

HIDDEN FRUIT.

1. STOP, Lu, mother has prepared a lunch for us.
2. The ugly cur ran too fast to be caught.
3. To prosper, Simmons, is utterly impossible.
4. I love a foreign clime.
5. Rolf, I grant your request.
6. Richard ate something that made him sick.
7. A do not care a snap, please your honor.
8. Give me a glass of water, Melony.
9. While sick I loathe bread; fruit of all kinds I crave.

PUZZLER ANSWERS.—Oct. 14.

BIBLICAL ENIGMA.—"Whoso curseth his father or his mother, his lamp shall be put out in obscure darkness."

DOUBLE CROSS-WORD ENIGMA.—Danube, Thames.

DOUBLE ACROSTIC.—Primals, Wolf; finals, Bear.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.90 for the two, may select any two of the following-named plants and a paper of the seed of the Molucca Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory or garden. Its growth is rapid—small plants attaining the hight of five feet during the summer months. In the fall it may be cut back to any desirable size and potted for the winter, when it will quickly recover its symmetry and resume its ever-blooming habit. Its quick and exceeding popularity is a sufficient guarantee of its merits.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is as yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class. It is difficult to select a more attractive plant than Marie Lemoine when freely blooming. Every truss is in itself a bouquet. The leaves are large, zoneless, vigorous. The plant is compact and, like *Abutilon Boule de Neige*, is invaluable, either for the conservatory, window or garden.

Hydrangea paniculata grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It has stood 26° below zero unharmed. It begins blooming in early August, continuing until after hard frosts. The thyrses of flowers, first greenish-white, then white, then rose, often measure a foot in length and twenty inches in circumference. Every stem being thus terminated, the striking appearance of an entire plant may be conceived. There can be no doubt that this is one of the most valuable of all perfectly hardy shrubs.

Variegated Ampelopsis or *Vitis heterophylla variegata*.—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green, much as *Abutilon Thomsoni* is variegated with green and yellow. From its racemes of flowers are formed fruit as large as currants, each one of which is a different color in shades of claret, azure-blue and green. These berries, which are first as soft as a currant, become finally as hard as bullets.

The pretty stems are also variegated, green, whitish and rose. The roots are perfectly hardy, and the vine's growth so rapid that it will cover twenty-five feet square in a season. For conservatory walls or pillars, for trellises or rockeries, it cannot fail to please. It has been growing in the RURAL EXPERIMENTAL GROUNDS for several years without the least protection.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the singular Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

News of the Week.

HOME NEWS PARAGRAPHS.

THE Grand Jury of Salem, N. J., has found a true bill of murder against James Weedon, Samuel Collyer, John Clarke, Richard Goodwin and "Fiddler" Neery, the men concerned in the killing of Walker in the prize ring.

Mary Maguire journeyed from Ireland six years ago and settled in Bayonne, N. J., with her son John. He died and she was sent to the Snake Hill Almshouse. Recently she returned to Bayonne and begged for money to send her to Ireland, where she could die surrounded by her friends. She is over 70 years old. Chief of Police Whitney procured her the passage money, and on the 17th visited the residence of a friend where the old lady was living. She could hardly restrain her joy when told that he was to conduct her to the steamship. After she had bade farewell to her hostess and was on the threshold of the door, she uttered a slight scream and fell to the floor. She died before medical assistance could be procured. Death, the physician said, was from excess of joy.

M. Cazeneuve recently entertained a company of gentlemen in a small room at Chickering Hall, this city, by doing many surprising things of the kind performed by so-called Spiritual mediums. He was so tied that neither head, hands, nor feet could be moved, according to ordinary laws of motion; and his shirt cuffs were sewed to the bandages about his wrists in such a way that the hands could not be slipped from their confinement without severing the threads. So bound he rang bells, blowed on a penny trumpet, and beat a drum, all at the same time; or somebody or something did behind a curtain drawn across the front of a cabinet. He filled the large eye of a needle with short threads from a spool laid upon his lap, cut paper into curious shapes, wrote on a slate the words which members of the assembly had privately written on cards, gave the marks on a domino secretly selected by some one present, took off his own stockings and placed them in his lap, while his boots remained on, and his feet securely tied above the ankle, took off the coat of a gentleman who, blindfolded, sat beside him in the cabinet, with one hand on the performer's breast and another over his forehead, to detect any movement, kissed another gentleman who sat beside him in the same manner, transferred that gentleman's watch and chain from his vest to the prestidigitateur's pocket, and did other marvels.

A large number of cotton-seed oil factories are being erected in Georgia, Alabama and Mississippi.

A man with $8,000 in his pockets was picked up helplessly drunk in the streets of East Cambridge, Mass.

At an auction in Thomaston, Conn., 700 bushels of potatoes were sold for $18, or a little more than 2½ cents per bushel.

A negro woman was arraigned before the Mayor of Raleigh, N. C., accused of bewitching a child. The Mayor, however, being a sensible man, would not entertain the charge.

Mrs. Jane M. Walker, ex-President Polk's sister, who died at Columbia, Tenn., a few days ago, left just 100 grand and great-grand-children.

The value of the natural and manufactured products of Rhode Island for the year 1875 was over $500 for each man, woman and child in the State.

The sandstone slabs containing the fossil tracks of a man and a bird, discovered at North Canton, Conn., are believed to be bogus, as the man who had them disappeared when a committee of scientific gentlemen agreed to examine them critically.

After reading Gov. Chamberlain's proclamation to rifle clubs, demanding the surrender of their arms, the Club at Rock Hill, S. C., procured a box, placed in it an old horse-pistol, a flint-lock rifle and an army musket, and marking the box "C. O. D.," shipped it to the Governor. The expressage was $18.

A Newfoundland dog in Toronto, sixteen years old, wears three medals, each representing a human life saved. He is gray and toothless, and is carefully provided for by the mother-superior of a convent.

A new law has been promulgated in Prussia by which Baptist congregations can obtain rights of incorporation in that country, and be recognized as religious bodies, each congregation to apply for it separately.

Owing to the vandalism of tourists and atmospheric causes, the sculptured monument over the grave of Bunyan, at Bunhill Fields, is rapidly disappearing. It has stood nearly 200 years, and it is hoped it will be restored.

During the year which ended last June seventy-six newspapers and magazines were started in Japan.

An agent representing several companies of English capitalists, has written to the Tennessee Bureau of Agriculture, Statistics and Mines, asking whether or not there are 300,000 acres of coal lands in the State for sale and, if so, to inform him at once, that his principals might purchase.

Dispatches from Charleston, S. C., dated Oct. 22, state that riotous demonstrations of negroes, generally supposed to be the result of the Cainhoy affair, are reported from various points of Charleston County. A serious demonstration of negroes in Mount Pleasant village, opposite Charleston, is alarming the white residents, who will petition Gen. Ruger for troops.

The record of the fall of rain kept by the Signal Service Bureau shows that for the first nine months of this year it has been much larger than the corresponding months of last year, being 39.03 inches, to 34.75 inches.

Mayor Stokley has been informed by the Duke of Richmond—the head of the British Commission to the Centennial Exhibition—that her Majesty's Government intend to present St. George's House, at the Centennial grounds, to the City of Philadelphia after the close of the Exhibition.

Advices from San Francisco, dated Oct. 22, state that the masters of the abandoned Arctic fleet express uncertainty as to the number of the men who remained with the ships or returned to them after beginning the homeward trip; but so far as can be ascertained it seems probable that fifty or sixty were left behind, many of whom were Kanakas.

The loss on New Bedford whalers in the late Arctic catastrophe is said to aggregate nearly $500,000, and is covered by insurance, principally in the Boylston, New England, Washington, and Manufacturers' Companies of Boston, and the Orient of New York.

FOREIGN NOTES.

THE German society for the introduction of cremation has paid 15,000 marks to the town of Gotha for the erection of a cremation furnace. Strict police regulations have been published for the examination of bodies offered for burning, and no corpse is to be cremated unless the deceased has expressed a wish to that effect, and his relatives have declared their concurrence.

As an example of the almost incredible prices paid for good building sites in London a transaction just completed is cited. The demolition of Northumberland House and the formation of a new approach to the Thames embankment at Charing Cross have left two plots of eligible land vacant. The plot on the east side of the new avenue has been let on a building lease for ninety years at a rental of £58,000 a year. The land comprises nearly an acre, and is triangular in shape, though only two sides could at best be used for shops.

Two hundred members of the Russian sect of "Old Believers," who had been banished to the Ural because they refused to join the Orthodox Russian Church, have been treated by the Russian authorities with a cruelty which has hitherto been supposed to be only characteristic of Turks Having been ordered for service in the penal regiments at Petro-Alexandrovsk, on the Caspian, they were so ill-used that many perished on the road, and others jumped into the sea to avoid their oppressors, and 100 only arrived at their destination.

Switzerland is joining in the outcry at the slackness of trade, and says its peculiarly national industries are being stolen from it. Geneva has no longer a monopoly of watchmaking, as this trade is being developed at Besancon; milk condensing is being largely carried on in England, and cheeses are made in and exported from America.

The Spanish Minister for Foreign Affairs has announced that all that is required in the way of passports from foreigners entering Spain is that they shall be provided with some document to establish their identity. The readiest means of identification, however, all over the European Continent, is the possession of a regularly-authenticated passport.

An Australian has taught a canary bird to sing "Home, Sweet Home," by suspending it before a looking-glass near a music-box which performed that melody. Supposing the bird in the glass was making the music, the bird finally caught the notes and now warbles the whole tune.

The London Field states that in the first fortnight in September the Maharajah Duleep Singh himself shot 2,350 partridges. On one day he shot 780. They were not the wild partridge, but "hand reared."

When any one is run over in St. Petersburgh the carriage causing the accident is confiscated, the horses are taken to the fire brigade for public use and the driver is imprisoned and flogged. Hence, fewer accidents than anywhere else.

It is understood that David Mills, member of Parliament for Bothwell, Canada, has been appointed to the vacant seat in the Dominion Cab-

The heat at Barcelona, in Spain, was fearful on inct caused by the recent appointment of Hon. Mr. Laird to the Lieutenant-Governorship of the Northwest Territory.

The missionary societies connected with Spain sent an address to Lord Derby, representing to him the dangers to which the Protestants in Spain were exposed in consequence of the intolerance of the clergy and authorities, and suggesting that he should invite the co-operation of other powers, especially Germany and the United States, to protest against the continued persecution of Protestants and to afford them protection. In reply, Lord Derby says: "Our Minister at Madrid is taking such steps as he properly can to induce the Spanish Government to put a lenient construction on the eleventh article of the constitution so as to secure full religious liberty to Protestants in Spain."

A special dispatch from Rome to the Daily News says: "Cardinal Antonelli's secretary has apologized to the Spanish Ambassador for the discourtesy shown him by the committee which superintended the reception of the Spanish pilgrims by the Pope, recently, in refusing to admit him and his attaches, but the Ambassador, having telegraphed an account of the affair to Madrid, has received instructions to demand an explanation from the Holy See."

The London Post says it bears from a trustworthy source that the Egyptians altogether lost 2,700 men in the recent Abyssinian campaigns.

The heat at Barcelona, Spain, was very great on the 1st of October. The vintage of black grapes, however, is very promising, and the wine presses are at work.

Harborton, N. J., Oct. 16.—We have had a rather, inauspicious season, owing to heavy storms, in the spring and fall, and a severe drought throughout the summer. On Saturday night, Oct. 14th, we had quite a fall of snow, followed next day by a cold northwest wind. Pasturage has been very scant, most of the season, but we had rain enough in fall to make nearly an average crop of corn and stalks. Wheat is yielding fairly for last years crop and the growing wheat looks well. Oats below average. Potatoes scarce. Hay rather a short crop, of good quality.

Prices of Farm produce are: Wheat, $1.25 ₩ bu.; Corn, 60c.; Oats, 30c.. Potatoes, $1.00 ₩ bu.; Hay, $15 to $18 ₩ ton; Butter, 35c. to 37c. ₩ lb.; Pork, 7c. to 7½c. ₩ lb.; Apples 50c. ₩ bu., for winter apples, (for windfalls of which there are a great many) no sale.—D. J. BLACKWELL.

STEINWAY'S VICTORY AND LAURELS.

THE following official report of the Judges of Awards shows *conclusively* that the HIGHEST HONORS in the gift of the Centennial authorities were *unanimously* awarded to *Steinway & Sons*. The report speaks for itself, and an attentive perusal and a critical comparison with other published reports is respectfully solicited.

THE ALL-IMPORTANT JUDGE'S REPORT.

The undersigned, having examined the Grand, Square and Upright Pianos exhibited by STEINWAY & SONS, respectfully recommend the same to the United States Centennial Commission for award, for the following reasons, viz.:

For greatest concert capacity in Grand Pianos, as also highest degree of excellence in all their styles of pianos, viz.: largest volume, purity and duration of tone, and extraordinary carrying capacity, with precision and durability of mechanism; also, novel disposition of the strings and construction, and bracing of the metal frame.

Improvements applied by Steinway & Sons were the following:

I. A DISPOSITION OF THE STRINGS IN THE FORM OF A FAN, placing the bass string across the steel strings, and materially elongating the sound-board bridges by moving them nearer to the center of the sound-board itself, thus setting greater portions of the latter into vibratory action, and so producing a greatly increased volume of sound.

II. A DUPLEX SCALE, patented in 1872, brings into action those portions of the strings which heretofore lay dormant and inactive, thereby increasing the *richness, pliability* and *singing quality*, as well as the *carrying capacity* of the tone, especially of the upper notes.

III. A CUPOLA METAL FRAME, patented in 1872 and 1875, with its new system of a crossbar and bracings, giving *absolute safety* against the pull of the strings, and increasing the capacity to stand in tune. The space gained by the use of the Capo d'Astro bar permits the use of more heavily felted hammers, whereby a *pure, rich* quality of tone is retained much longer than heretofore.

IV. A CONSTRUCTION OF THE SOUND-BOARD, with its system of compression, (as shown in the patents of 1866, 1869 and 1872,) preventing that relaxation of the sound-board which is the natural result of its constant concussion, caused by the strokes of the hammers against the strings, and by atmospheric influences.

V. A METALLIC TUBULAR FRAME ACTION (patented in 1868 and 1875), being entirely impervious to atmospheric influences, in conjunction with the new system of escapement, resulting in *unerring precision, power and delicacy of touch and durability.*

VI. A TONE-SUSTAINING PEDAL (patented 1874) extends the capacity of the piano for the production of new musical effects, by enabling the performer, at pleasure, to prolong the sound of a single note or group of notes, leaving both hands free to strike other notes; is of simple construction, not liable to get out of order, and its use easily acquired.

Steinway & Sons exhibit in "Machinery Hall" samples of METAL PARTS and HARDWARE, and FULL METAL FRAMES of Grand, Square and Upright Pianos; also samples of their PATENT METALLIC TUBULAR FRAME ACTIONS, all produced at their foundry and metal works at Astoria, Long Island.

These articles of composite metal show the *highest perfection of finish and workmanship* and the *greatest* firmness and uniformity of metal structure, a steel-like and sounding quality with a tensile strength exceeding 5,000 pounds per square centimetre, as demonstrated by actual tests. The full metal frames of cupola shape, possess an *unequated degree* of resistance, permitting a vastly increased tension of strings without the slightest danger of break or crack in said metal frames, thereby *considerably increasing the vibratory power, and augmenting the lasting qualities* of their instruments.

Signature of the Judge: H. K. OLIVER.

Approval of Group Judges:

J. SCHIEDMAYER,	P. F. KUPKA.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 21, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	83,838	Molasses	86
Whisky	2,924	Rice, bbls	2,581
Corn meal, bbls	1,324	Cut meats, pkgs	13,422
Corn meal, bags	1,860	Lard, pkgs	5,310
Wheat, bush	619,914	Tobacco, hhds	1,691
Corn, bush	1,079,648	do. pkgs	4,661
Oats, bush	329,886	Butter, pkgs	26,364
Rye, bush	13,733	Cheese, bxs	41,610
Malt, bush	19,797	Cotton, bales	37,243
Barley, bush	410,401	Rosin	1,409
Beans, bbls	9,340	Suts. turo., bbls	963
Grass seed, bush	19,988	Dried Fruits, pkgs	2,578
Beef, pkgs	805	Eggs, bbls	5,676
Wool, bales	2,348	Peanuts, bags	281
Hops, bales	2,917	Leather, sides	45,214
Pork, bbls	2,029	Sugar, hhds	—
Tallow	879	Oil cake	11,963

EUROPEAN news during the week has had a sword in it, and when it threatens an uplifted movement, a rise is also apt to occur in all prominent items of produce suitable for exportation. There has been considerable advance in breadstuffs and provisions, more attributable, however, to the excitement created by the rapid and various war-like dispatches received than to an earnest speculative demand. Cautious dealers in foreign interests do not respond hurriedly to the brightened ideas of holders; in fact, property has gone largely abroad and many European buyers feel it to be better policy for them to wait until a more tranquil basis appears than the immediate outlook affords. True, many impetuous operators bought heavily in grain upon the first signification of national embroilment abroad; but later transactions have been of a more sober character. Gold, which is a good barometer of ocean commerce, has shown tamer fluctuations than was expected, though there was considerable flurry on receipt of the early belligerent news, and the fact has had considerable influence in checking feverish business on 'Change.

BEANS AND PEAS.—Exports beans past week, 600 bush.; since Jan. 1, 474,400 do.; same time last year, 137,611 do. In beans the demand is steady for new crops. Old also sell well when of suitable quality. Receipts are not of a satisfactory high grade. Canadian peas have advanced. Green, firm. B. E. easier. Black or Turtle soup beans lower.

Beans—New medium, $1.55@1.60; do. marrow, $2.25 do. pea, $1.65@1.70; white kidney, $2.15@2.225; red do., $2; Old Beans—Medium, prime, $1.40@1.45; other, $1.20@1.35; marrow, prime, $2.10@—; other, $1.80@2; pea, prime, $1.50@1.55; other, $1.30@1.40; white kidney, prime, $2@2.10; other, $1.65@1.80; red do., prime, $1.70@1.80; other, $1.40@1.60; black, $2.75 Canadian peas, new, ₩ bbl., free, $1.12@1.14.; do. bulk, 93@94c.; green do., new, $1.45@1.50; do., S. B. E. peas (2-bush. bag), $2.20@2.25.

BEESWAX.—Trade is very slow at present and prices unsettled; Western quoted 30@31c., and Southern 31@32c.

BROOM CORN is coming in more freely, but is hard to sell. Quoted at 7@8c. for short green brush, 6¾@7¼c. for green hurl, 5@6c. for medium green, and 3@4c. for red and red-tipped.

BUTTER.—Exports past week, 1,910 packages. The scarcity or want of fine State butter is making the range wider in creamery and fine pails. These sell almost upon arrival. The market may be also called active for fine high grades half tubs and firkins with a good demand for entire dairies when they have a good showing of fresh ends. Welsh tubs are more largely inquired for than they have been in several past years. Fresh flavored Western is in demand. The under grade, drag and seem to be at the mercy of low buyers. Exportation has fallen off very seriously.

We quote:—Choice pails, 35@—c.; prime, 33@34c.; poor to good, 25@30c.; creamery pails, choice, 37@38c.; good, 34@37c.; sweet cream pails, 30@36c. State firkins, choice, 32@33c; fair to good, 25@30c.; do. half firkin tubs, choice, 32@33c.; fair to prime, 25@30c.; do. Welsh tubs, choice, 32@33c.; other, 24@28c.; inferior State, 15@20c.; Western creamery, choice, 35@35c.; other, 32@34c.; do. firkins, best, 21@22c.; other, 14@18c.; dairy tubs, choice, 24@26c.; other, 15@18c.; factory choice, 22@24c.; other, 14@18c.

State dairies quotable at 30@32c. with full tubs Welsh tubs, dairies, 26@31c.

CIDER.—Prices are unchanged. Casks quoted at 8c. ₩ gal., small pkgs., fresh 10@12c.

CHEESE.—This has been another very dull week. Strictly fancy late made factories being in small stock are held at 13½c. and to 14c. for some exceptional lots, but it is difficult to get even the lower rate, while the under grades are especially depressed. The foreign markets offer no encouragement at present.

Fancy factory, 13½@13¾c. for fancy September; do. job lots, 11@14½c.; 12@13c. for fine August; good and prime, 11@12c.; fair, 9½@11¾c.; State farm dairy, fancy, 11¾@12½c.; good to prime, 10½@11c.; fair and good, 9@10c. Western factory, good and prime, 11@12c.; fair lots, 9½@10¾c.; do. cheddar, choice, 12@12½c.; do. flat, choice, 12½@13½c.

Exports for the week, 10,973 boxes.

COTTON has been depressed and lower, by the break in the markets on the other side, occasioned by the war rumors.

The latest quotations are:—October, 10 13-16@10 37-32c.; November, 10 15-16@10 31-32c.; December, 11 53-32@11 3-16c.; January, 11¾@11 13-32c.; February, 11 29-32c.; March, 11 25-32@11 13-16c.; April, 12@12 1-32c.; May, 12 3-16@12 7-32c.; June, 12¾@12 13-32c.; July, 12 17-32c.; August, 12¾@12 11-16c.

Quotations for spot cotton, based on American standard of classification:

DRIED FRUITS.—Apples have some little export demand and firm in price. Peeled peaches scarce, higher and strong. Blackberries and cherries doing better, with small supplies.

Apples—State, sliced, 6¾@7¼c.; do., quarters, 6¼@7c.; Southern sliced, new, 6@7c.; choice do. 7¼@8¼c.; fancy, 9@10c.; do., new quarters, 4¾@4c. Blackberries, 8½c. Peeled peaches, new, nominally 14@16c.; unpeeled peaches, halves, 7@8c.; do. quarters, 6@7c. Plums at 12@13c. Raspberries, 26@27c. Cherries, 17c.

Exports of apples quite free—802 bbls. for the week.

EGGS.—Light arrivals have vitalized the market and the higher rates are firm. The grocery demand is not heavy but hotels, &c., are enlarging purchases. There is a little more movement in limed since fresh advanced.

Near points, 26@28c.; State and Penn., 25½@26c.; Western, prime, 25c.; do. other, 24@24½c.; Canadian, 24@25c.

State limed, 20@21c.; Western, do., 17@20c.

ESSENTIAL OILS.—There are no new features. Peppermint—Western and State oil offered freely at $2.25 ₩ lb. Spearmint, asking price, $2 ₩ lb. Sassafras in fair demand at 45c.

FLOUR.—The disturbed condition of affairs on the other side, with possibilities of war, gave considerable excitement to the market and, under large dealings, prices run up 30c. to 40c. ₩ bbl. At the close a quiet feeling prevailed, but holders not inclined to concede.

Sales at $4.70@5.00 for poor to very choice superfine State; $5.45@5.60 for very common to fair extra do.; $5.30@5.85 for good extra do.; $5.40@5.50 for fancy do., and $5.65@6.75 for fancy to very choice extra; $4.70@5.00 for superfine Michigan Indiana, Iowa, &c.; $5.45@5.65 for shipping extra do., the inside price for inferior, and $5.70@5.80 for choice to very fancy extra do.; common to choice white wheat extras, $5.85@6.75; fancy do. $6.80@8.00; winter wheat, good to choice family $6.50@8.25; round-hoop Ohio, $5.45@5.60, and trade brands of do. at $5.65@7.00; St. Louis, $5.50@6.65 for common to fair extra, and $6.70@8.50 for good to very choice; Minnesota "straight" at $6.75@8.00, and patent at $8.25@9.50; mixed stock at from $5.25@5.25; city mill extra for West Indies at $6.25@6.80; do. English brands, $5.50@—; do. trade and family $7.00@8.50; No. 2 at $3.50@4.25. Corn meal—$2.85@3.15 for yellow Western, and $3.35@3.40 for Brandywine.

FRESH FRUITS.—Exports of apples, past week, 5,442 bbls. Low prices and fine quality induce exporters to ship freely to Liverpool and Glasgow, all suitable steamer room having been largely taken at 4s. per bbl. With so large a crop of apples as we are to handle this season, this is a fortunate outlet, especially as the purchases include lines or mixed lots of varieties that have not been largely introduced in the British markets. Until within a few years the Newtown pippin was about the only American apple that was taken in commercial quantities. Lately prime Baldwins and showy Greenings have an encouraging inquiry. The home demand is good, and prime winter stock may do better when the perishable sorts are out of the way. Still, dealers do not look for a sudden advance. Some good lines of pears remain, and prices are firm for them. California forces out the supply of table. Grapes are selling steadily, with some extra call in market. Cranberries do not sell up to arrival. Chestnuts doing better. Hickory nuts not wanted much until later on. The past two weeks have given us the largest supply of Louisiana oranges ever received. We quote:

Apples, State, ₩ bbl., fall and winter, $1.50@1.75; mixed, $1.37@1.50; good to fair, $1@1.25; common open heads, 50@85c. Pears—Duchess, $6@10; Seckel, 8@12; Virgalieu, $4@10; Vicars, 4@6; cooking, $3@4; California, Duchess and B. D'Anjou, $4 ₩ box; B. Clairgeon, $4.50; W. Nellis and E. Beurre not yet wanted. Quinces, fancy, ₩ bbl., $12@14. Cranberries, crates, $2.00@3.12; reg. bbls., $8@10. Grapes Catawba, ₩ lb., 7@7½c.; Isabellas, 5@6c.; Cal. Tokay, $6 ₩ 30-lb. case; Malaga and Muscat, $3@4 do.; Black Prince, $3@4. Chestnuts, ₩ bush. $1@1.50. Hickory nuts $1.50@1.75; Va., fancy, $1.50@1.75; other $1@1.60.

GRAIN.—In wheat will the gloomy appearance abroad, and anticipated troubles growing out of the Turkish question, there has been a disposition to operate on speculative account as well as by exporters, and under heavy transactions and an excited temper; prices ran up about 7c. ₩ bushel, but with a more peaceful position in the later dispatches, the market at the close is very quiet; new No. 2 Chicago spring, $1.28 bid and $1.30 asked; new No. 2 Milwaukee held at $1.30; old No. 2 Milwaukee spring sold at $1.20; winter red Western at $1.23@1.28; Rye at 72@75c. for Western, 87@92c. for Jersey, State and Pennsylvania. Corn is active at a slight advance; sales at 58½@62½c. for mixed Western. Oats are a trifle higher; sales 32@50c. for mixed Western and State, and 32@50c. for white do.

HAY AND STRAW.—There are large receipts and prices are easier.

Bale hay 60c. for shipping; 70@90c. for retail qualities; clover, 50@60c.; salt, do., 35@60c. Straw quoted at 70@80c. for long rye; 50@60c. for short rye, and 50@60c. for oat.

HIGHWINES selling at $1.16.

HOPS.—Exports for the week, 1,414 bales. Trade has been moderate this week and, on a little pressure to sell on instances, lower prices made. The disposition now is to await results from recent shipments abroad.

New Yorks, good to choice, new	35 to 37
New Yorks, low to fair, new	25 to 32
Eastern, new	25 to 33
Yearlings	10 to 20
Olds, all growths	4 to 8
California, new	35 to 38

POULTRY AND GAME.—Live is quoted at losing prices; market badly overstocked.

New Jersey turkeys, 13@14c. ₩ lb. N. J. fowls and chicks, 13@14c.; State and Penn., 10@11c.; Western, 10@12c.; Southern, 9@10c.; roosters, 8@9c. Geese, N. J., ₩ pair, $1.75@2; Western, $1.37@1.62. Ducks, N. J., ₩ pair, 81@87c.; Western, 50@65c. Live pigeons for 25c.

The market is generally weak. It is rather early for large receipts, and qualities are not above what city killers can supply. Still, perhaps, it is well to get rid of the coarse stock early. Turkeys will be very plentiful after such a favorably dry summer.

Turkeys, N. J., 15@16c.; State, 13@17c.; Western, 15@16c. Chickens, dry-picked, 14@15c. N. J. chicks, 13@17c.; State, 12@14c.; Western, 11@13c. Ducks, N. J., 15@18c.; State, 13@17c.; Western, 13@20c.; common turkeys and fowls, 8@9c.

Game.—The weather has been comparatively warm, and game does not turn out showy. Prices generally easy. Venison has a fair demand for restaurants. It is early for market trade. Wild ducks are abundant and lower, and irregular in quality.

Wild ducks, mallard, ₩ pair, 50@60c.; canvas-back, $1.25@1.50; red-heads, 35@70c.; teal and other, 25@30c. Quail, ₩ doz., $2@2.50. Partridges, ₩ pair, 50@75c. Grouse, ₩ pair, 90c.@$1; Hare, ₩ pair, 50@60c. Rabbits, 25@30c. Venison, whole, 11@12c., saddles, 18c. Woodcock, 50@60c.

PROVISIONS.—Under a sharp, speculative feeling at the West on the foreign advices of probable war, prices ran up here sharply, but closing quiet at some decline. Mess pork quoted at $16.85 for spot, $16 for November, $15.80 for December. Bacon at 9¾c. for long clear and 10c. for short clear. Western steam lard at $10.20 for spot; $9.95 for November; $9.90 for December and $9.95 for June. Stearine at $11c. for Western; beef hams at $20. Tallow at 8¾c. for prime. Beef barrelled lots quoted at $5@10 for plain mess, $10@11 for extra mess, $13.50@14 for packet. Tierced quoted nominal for prime and India mess. City extra India mess at $27.

SEEDS.—Grass are very firm and fairly active; strictly prime clover has sold at 15¾c., and is held at this rate, but most bids are not over 15c. Timothy brings $2@2.15.

TOBACCO.—Exporters are dealing largely in seed-leaf and at strong prices. Western leaf is depressed and dull. We quote:

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.
Common lugs	5¾@6	6 @7¾
Good lugs	6¾@7¼	8 @9

VEGETABLES.—Exports of potatoes past week, 2,673 bbls. There is a good steady market for potatoes at $2@2.75; the latter for extra peach blows. Sweet are drooping again, with a large supply of Virginias. Onions are firm, war news can affect them favorably. Other items quiet. We quote:

Potatoes—Peach Blows ₩ bbl. $2.50@2.75. Early Rose, prime, $2.25@2.62; other, $2.12; Peerless, bulk, $2@2.25; sweet, Del. $2@2.12; Va. $1.75@2. Cabbages, ₩ 100, $5@6. Tomatoes, ₩ bush., $1.12. Marrow squash, ₩ bbl., 50@$1. Egg plant, ₩ 100, $3.50. New Russian turnips, ₩ bush., 75c.@$1. Onions—Yellow, ₩ bbl., $2; white, $2.25@3.; red, $1.50@1.62. Cauliflower, ₩ bbl.; $2.50@4.

WOOL.—The market has been quite active again this week, on demand from manufacturers, with some speculative margins. Western fleeces, combing and delaine stock, California, Texas and pulled all sharing in the trade and at strong figures. We quote:

Mill feed strong at $14 for shorts, $16 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 35c. ₩ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Oct. 21, 1876.

THE cheese market this week has not been very brisk, and prices are lower than last week. Dairymen came into the market expecting 14c. for September cheese, which is of fine quality, but buyers claimed that 13c. ought to be top price and were not eager to buy at much above that figure. Nearly 500 boxes of farm dairy cheese was on delivery and sales were made at from 11¾c. to 12¾c., with one or two lots extra fancy going at 13c. The bulk of sales may be quoted at 12@12½c. Factories were well represented, the aggregate of offerings amounting to 10,000 boxes. Sales ranged from 12¾c. to 13½c., about 4,000 boxes changing hands. One lot brought 14c., the sale having been arranged at that figure the previous week. Owing to the dullness of the market and the dullness in prices, a large number of factorymen refused to sell, preferring to hold over their cheese for the present.

Butter is coming forward in considerable quantities, the sales this week ranging from 26c. to 28c. for farm dairy, and from 29c. to 30c. for extra lots and creamery. The weather is cold, with frosty nights, and flurries of snow on the hills.

We have advices from abroad for the first week in October. Our London correspondent reports that Break Cheddar and Wiltshire double are wanted. Fancy American cheese sells well at 58s. to 63s. ₩ cwt. for August make, which are better this season than for the last twenty years. The stocks to hand have, when fine, sold for 66s.

American, extra fine, 65@66s.; fine, 63@64s.; good, 56@60s.; Common and low grades, 36@52s.; English cheddar sells for 80@92s.; Wiltshire, double, 72@78s.; Cheshire medium, 44@48s.; fine, 70@84s.; Scotch, 61@70s. Dutch cheese—Edams, 66@70s.; Gundas, 54@58s.; Derby slaps, 60@64s.

The change in the weather has given tone to the butter market and Continental and American varieties have sold at quotations. We give prices:

Clonmels, 115@130s.; Corks, 115@128s; Dorsets, 106s.; Jersey, 120@130s.; Friesland, 140@144s.; Normandy, extra, 120@150s.; American and Canadian, 90@130s.; ₩ cwt.

Oleomargonin or artificial butter sells for 96@112s. per cwt.

LIVE STOCK MARKETS.

NEW YORK, Oct. 21, 1876.

Totals this week	11,205	11	1,351	28,807	32,340
" last week	10,533	23	2,356	23,630	22,983

BEEVES.—Trade opened slow on Monday last, at reduced rates. There was a heavy run of cattle and the quality was not good enough to force sales. Prices ranged from 7@11c. ₩ lb.; weights, 56@10 cwt. The markets closed weak, with a large number of car-loads unsold. Wednesday, trade extremely slow on a heavy run of cattle, ranging from poor to fair; prices, 6¾@10¾c. ₩ lb.; weights, 1¾@9 cwt., strong. Thursday, trade dull, at 7¾@11¾c.; weights, 1¾@8¾ cwt. Friday, the markets closed weak at 7@10¾c.; weights, 5¾@8¾ cwt. From 51@57 lbs., net, has been allowed, with a few top steers sold on 58 lbs. net. Spanish herds, direct from the Plains, 6¾@8¾c. ₩ lb. Native steers, 7@10¾c.; grade do., 10@11c. Dry cows, 8c. Bulls, live weight, $2.30@3 ₩ cwt. Oxen, rough quality, 7¾@8¾c.

MILCH COWS.—On extremely light arrivals trade is slow, with a fair demand for fair quality cows, which is not met. Seventeen cows, calves included, sold at $45@75 ₩ head; 13 Springers at $17.50@57.

VEALS AND CALVES.—The smooth quality veals to hand are so low in number that they do not influence trade. Such have been sold from 7½@11c. ₩ ₩., and have been quoted from Central New York, save a few head from Pennsylvania. Coarse quality calves are in heavy supply and very slow of sale, at 4@6c. ₩ lb., also at $3.75@11.50 ₩ head. State calves sold at $10@11.50 ₩ head. Coarse quality Western do, 5c. ₩ lb., also at $6@7.50 ₩ head.

SHEEP AND LAMBS.—Monday last trade in sheep was slow at ½c. ₩ lb. reduction on our last quotations, and ½c. ₩ lb. on lambs, which were in still less demand. Sheep sold at 5@6¾c. ₩ lb.; lambs, 6@7c. Wednesday, no improvement in trade, sheep sold at 5@6¼c. ₩ lb.; lambs, 6¾@6¾c. Thursday, trade dull; sheep, 4@6c. ₩ ₩.; lambs, 5¾@7c. Friday, the markets closed weak; sheep, 4@6¾c. ₩ lb.; lambs, 6¾c. State sheep sold at 5@6¾c. ₩ lb.; Ohio, 5@6¾c.; Indiana, 5@5¾c.; Kentucky, 5¾@6c.; Canada, 5¾@6¾c.; State and Western bucks, 4@5¾c.. Jersey ewes, 5@5¾c. State lambs, 6@7c. ₩ lb.; Pennsylvania, 6¾@6¾c.; Canada, 6¾@7c.

HOGS.—Only one car load of Ohio hogs has been sold since our last report; price, 6¾c. ₩ lb., average live weight, 203 lbs. ₩ head; city dressed, 7¾@8¾c. ₩ lb. Trade uncertain at reduced rates.

HORSE MARKET.—City trade fair in low-priced animals. Ninety-two head poor quality light harness horses sold at $30@100 ₩ head; general sales at $62@75 ₩ head; 10 ordinary quality do. $10@20 ₩ head; 11 pairs of family carriage horses, $300@550 ₩ pair; 3 pairs stylish do., 1,000@1,200 ₩ pair; 7 saddle horses, quality poor, $30@125 ₩ head; 30 coarse quality heavy draft horses, $62@110 ₩ head; 9 pairs do., $300@400 ₩ pair; 2 pairs choice do., $500 ₩ pair; city railroad horses sold at $90@125 ₩ head; city stage line do., $130@130 ₩ head.

PERSONAL ITEMS.

CANNING spent over $100,000 in one election.

THE Empress of Brazil is going to Egypt for the winter.

GEN. BLUMENTHAL will succeed Moltke should the latter resign.

IN the polite circles of Morocco the word "death" is not used.

TANGIERS people keep tame snakes to drive mice out of their houses.

THEY swear witnesses on a volume of "London Punch" out in Colorado.

THERE is another rumor that Mr. Delane will retire from the London Times.

WHAT piece of carpentry becomes a gem as soon as it is finished? A-gate.

THE President has pardoned Jake Rehm of Chicago whisky frauds notoriety.

AN Australian, named Evans, has a large cannon placed on his breast and fired.

THE head of the St. Lawrence is said to be larger than its mouth—an unusual symmetry in rivers.

THE statement that Mlle. Albani was to marry a Gye was emphatically denied by that lady at Birmingham.

PROF. TAYLOR LEWIS of Union College is in feeble health, and may not be able to lecture during the present term.

GEN. W. F. BARTLETT of Pittsfield, Mass., has had a serious relapse, and but little hopes of his recovery are now entertained.

VIRGINIA proposes a monument to Henry A. Wise. We suggest as an appropriate inscription; "Go thou and do like-Wise."

ONE hundred and fifty pounds of female trapezist fell from the bar to the stage, alighting on a supe. He is sick unto death.

THE Rev. T. DeWitt Talmage has resigned his position as editor of the Christian At Work. Rev. W. M. Taylor will succeed him.

LIEUT.-GOV. Dorsheimer is lying sick at Rochester. A cold contracted in Indiana has resulted in congestion of the lungs.

THE stranger who bought a quince at a Detroit grocery under the idea that it was a "Spanish apple," is red-hot for a war with that country.

GEORGE ELIOT is not so bastidious as some writers. In Middlemarch she speaks of Sir James Chettam as pulling down his waist-coat.

A PERSONAL advertisement in a Cincinnati paper says:—"A young blonde widow would like to correspond with a middle-aged coal merchant."

A NEW JERSEY woman, eighty-seven years old, was determined to get married, but had a stroke of paralysis as the ceremony was being performed.

GRACE GREENWOOD rode on the cow-catcher for forty miles, and when she was helped down it took her half a day to get the wrinkles out of her nose.

WHAT'S the difference between a tardy mark at school, and a high private in the *Corps d'Afrique?* One's a dilatory mark, the other's a military dark.

CARDINAL MANNING'S solicitor has run away with $150,000 which he had as trustee for Catholic charities and associations. The Cardinal himself loses $10,000.

"WHAT," said Bonaparte to Las Casas, "is more overbearing than weakness which feels itself protected by strength? Look at women, for example."

THE official statement of the Secretary of the State of Maine shows that the majority for Governor Connor, Republican, over Talbot, Democrat, is 15,037.

THE rising operatic star in Paris is Mlle. Etelka Gerster, a young Hungarian girl aged nineteen. She is described as not beautiful, but "pure-looking" and classic. Her voice is a soprano.

SAID a fancy farmer to some guests at his country seat on the Hudson:—"Will you have milk or champagne, my friends?" adding, somewhat sadly, "one costs as much as the other."

GERMANY orders 90,000 American revolvers. Although during her last war she forbade the exportation of German horses, she has no objection now, it seems, to the importation of American Colts.

"PROFESSOR" DIXON, who performed the "living burial" feat recently at Belvidere, S. C., died of fever a few days ago, and was buried in the identical coffin which he had used in performing his trick.

GOV. BEVERIDGE, Prof. David Swing, and Gen. John M. Palmer have been elected as judges of the next contest of the Illinois Intercollegiate Association. Ex-Senator Schurz was chosen as alternate.

THE cold winter of 1875, the doctors said, gave nearly everybody seeds of consumption; the hot summer of 1876 has left the air full of malaria and fever, so it is declared. It is a wonder how we exist at all.

WALTER SAVAGE LANDOR, it is said, entering a ball-room, saw therein a young lady who pleased his eyes. He cried, "The prettiest girl in the room; I'll marry her!" And marry her he did, straightway.

BRET HARTE, in "Gabriel Conroy," vented his spite on California and made several people feel uneasy, and now California pays him back by suggesting that in that State the great genius was a dead beat.

WE have often thought that these mammoth circus posters contained a good deal that was hard to swallow, and now it turns out that a cow actually died from eating one off a wall last week at Boonesboro', Md.

SAYS Max Adeler:—"Professor Huxley proves conclusively that the alligator was once a bird, walking about on two legs, and to this day it lays eggs. We are glad it was never domesticated and made a barn-yard fowl."

A SISTER of the late ex-President Polk died a few days ago at Columbia, Tenn. She was the last surviving member of her immediate family, which consisted of nine brothers and sisters, President Polk being the eldest.

ADELINA PATTI is not in good health. Some say that her throat is affected, others that her lungs are threatened; at all events, her physicians have forbidden her to brave the rigors of the Russian winter the coming season.

BAYARD TAYLOR says the cross-purpose arguments of the evolutionists and their opponents impress him very much as if one should ask, "Do you like peaches or a Mansard roof?" and another should answer, "I prefer railroad stock."

MR. CHARLES P. HUNTINGTON has been examined on the affairs of the Central Pacific Railroad, and has a convenient forgetfulness. Yet there is no doubt that the Construction and Finance Committee of that road made their money by deep fraud.

THAT six months' armistice in Servia is not remarkable. The soldiers on both sides threw down their arms and ran for the nearest telegraph office, swearing they couldn't fight while the returns from Indiana and Ohio were coming in so lively.

MONS. COLOMBIER, a merchant of Paris, recently deceased, has left 30,000 francs to a lady of Rouen, for having, twenty years ago, refused to marry him. "through which," says the will, "I was enabled to live independently and happily as a bachelor."

THE Bishop of Manchester, in a recent public address, said it was not for him to say whether Mr. Irving's reading of "Hamlet" was the true one or not; but he knew Mr. Irving was a great actor, and it was an ennobling thing to see "Hamlet" played by him.

THE town of Gotha has granted a site for the cremation of bodies, the Duchy of Saxe Gotha having allowed the rite to be established. Previous to cremation, however, all bodies are to be examined by competent medical officers, that the cause of death may be properly ascertained.

A MATCH between George Washington Childs and Martin Farquhar Tupper has been arranged to come off in Philadelphia some time during the ensuing month. In any other age than this, both these famous poets would have been driven from Parnassus into the undertaker's business.

THE Duchess of Edinburgh is to spend the winter at Malta, where her affectionate sponse will join her, and if rumor be true perfidious Albion will be blessed with but little more of the light of Marie Alexandrovna's countenance. Eastwell Park is in the market, and even the Duchess' personal effects are undergoing purification in France.

The announcement that Don Carlos is about to start a newspaper should satisfy the rancor of even his most vindictive foes. With a moral certainty of being reduced to beggary in a twelvemonth, and with a wife and several small children on his hands, he may yet regret the non-acceptance of our offer to secure him the pea-nut stand at Fulton Ferry.

RALEIGH (N. C.) News says:—Allowing that each of the 275 visitors to the Centennial from Raleigh, yesterday, leaves at least $25 in Philadelphia, it is easily seen that the alarming sum of $6,875 will be taken from Raleigh, for which she will hardly get one cent in return. Now, the question arises, which does the most good or takes away the most money—centennials or circuses?

THE motto for the week on a little girl's Sunday school card was:—"Get thee behind me, Satan." There were gooseberries in the garden, but she was forbidden to pluck them. Pluck them she did. "Why did you not," said the mother, "when you were tempted to touch them, say, 'Get thee behind me, Satan?'" "I did," she said, earnestly, "and he got behind me and pushed me into the bush."

A BOSTON printer advertises that his boy is lost. Any one seeing a "full face" boy with a "small cap" will please return him to his anxious parent.—[N. Y. Commercial Advertiser. Said parent will then "chase" the boy, "put a head on him" and "lock up his form."—[Binghamton Republican. And unless the truant promise to do so no more it might be well enough to take a "stick" and "plane" him down so that it will leave an "impression" on his "frame." Whose next "take" is it?—[Elmira Advertiser. He has been found "setting up" on an empty "case" with his hand full of "pi."—Boston Com. Bulletin.

GARRETT TOWNSEND and Jim Bruce went out in the country to practice singing bass for the big Tilden and reform jubilee. They made the woods "howl!" for miles around, until a granger with a double-barrelled shot-gun on his shoulder, and blood in his eye, put in his appearance; "I'm lookin' for a bull that has been bellerin' around here all day. Have either of you fellers seed one anywhar?" Jim looked at the granger, then at Garrett, and said, "Mister, the bull you're lookin' for ain't fur off," and the man with the gun went on through the woods, as Jim turned and said, "Let's git, Garrett; that bass voice of yours 'll git us killed." And they walked back to the city in forty minutes.

Implements and Machinery.

Centennial Year of American Independence.

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you samples of the Celebrated Watches, manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION. These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, the Ruby Jeweled, set in Chaton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

Manufacturers,
NEW HAVEN, CONN.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper* and in Premiums to Agents.

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

A. Culbertson.—The long, slender, pinkish-colored caterpillar you send is the larva of some species of moth belonging to the *Geometridæ*, popularly called Geometers or "span worms." There is an immense number of species, and it would scarcely be possible in the present state of entomological science to undertake to name them all or any considerable number from the larva or caterpillar. In fact the larvæ of many of them are unknown, although the moths or perfect insects have been described and named. The one you send was probably feeding on the leaves of the rose-lush when found,

The fowls known as Plymouth Rocks are an American breed of recent origin and not very widely disseminated, it being more popular in the Eastern States than elsewhere. It is supposed to have been produced by crossing the Cochin China and some variety of the Dorking. It is claimed that the Plymouth Rocks are hardy, very prolific layers, and the hens excellent mothers. They come to maturity early and their flesh is excellent.

D. P. Rare.—The heads of Bermuda Grass are received, but we can find no seed within the chaff, the grain being false, as in all the dozens of specimens lately received from correspondents in the South.

J. L. Cockburn.—The grass you send as "Bermuda" is not that species, but the common Southern "Crab Grass," (*Panicum sanguinale*) an annual species, which seeds freely everywhere. It furnishes a very fair amount of food for stock late in summer, often appearing quite abundantly in grain fields and old pastures during the dry weather of July and August.

Wm. McL.—We have waited several weeks for the arrival of that "bird or some other thing," mentioned on your postal card, but it has not arrived. Consequently, we cannot give the desired information.

L. R. M.—Salt may be sown upon grass lands at almost any season, but early spring or at the approach of fall rains is the usual time of applying. Coarse or fine salt may be used, and that which has been used for packing pork and fish is worth as much for fertilizing purposes as that which comes directly from the salt works. In sowing salt upon meadows or grain, care should be given to the distribution of it over the surface, for if dropped in large lumps, it will do injury to the plants. Six to eight bushels is sufficient per acre for each dressing. If the salt is sown just previous to putting in grain it will answer just as well as afterwards, and there need be no fear of "burning" as when sown upon the growing plants; but on meadows it must, of course, be scattered over them.

Florist.—*Spirea Japonica* (*Astilbe-Holeia*) is excellent for forcing. *Dicentra spectabilis* also forces readily without any particular preparation. Among shrubs, *Deutzia gracilis*, *Weigelas*, *Rhododendrons*, *Kalmias* may be mentioned. Pot now.

M.—One of the best (or, rather, least objectionable) preparations for the hair is made as follows: Two-thirds pure castor-oil; one-third alcohol, perfumed with oil of rose, rose-geranium and patchouly—allowing that to predominate which is most pleasing.

Strion., Grand Rapids, Mich.—Pampas Grass is readily grown from seeds and, with good care, will bloom the third year. It is not hardy here without protection and not always with.

B. C., Pa.—There is no better time than the present for transplanting the Swamp Azalea (*A. nudiflora* and *viscosa*) and there are few showier plants during their period of bloom. Observe the conspicuous, reddish, scaly buds in some nursery or garden and you will recognize them readily in the woods.

C. O.—We are asked if the origin of the expression "the most unkindest cut of all" is known.

ANS.—It occurs in Shakspeare, but we cannot say whether he originated the phrase or not.

Planter wishes to know if apple and pear trees will thrive as well in sodded as in cultivated ground and how large the holes should be dug for trees three years old? ANS.—We should prefer cultivated ground. The size of the holes may be determined by the quantity of soil and amount of labor at his disposal, since he need not fear making them too large. Holes four feet in diameter and two and a half feet deep are the minimum limit. Even then before they fruit, the roots will be found to have extended considerably beyond the circumference.

New Yorker.—In another column will be found our views as to the pros and cons of spring and fall transplanting. But there are exceptions to all rules. This is our Centennial year and those who have not planted a tree or trees should do so, even though it be necessary to build a glass house over them and hire a man to look after them during the winter.

Dry Goods, &c.

LORD & TAYLOR

CONTINUE TO SELL THEIR IMMENSE STOCK OF

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred names*, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend as a present, at our lowest club rate—only $2.00, including postage.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

MOORE'S RURAL NEW-YORKER contains Sixteen Quarto Pages weekly, finely and profusely Illustrated and neatly printed. Only $2.50 per year, $2.00 in clubs of ten or more, postage paid. Great Inducements to Club Agents. Specimens, Premium Lists, &c., sent free.

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lakes of Life.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

Wit and Humor.

TWO WAYS OF DOING A THING.

A FRENCHMAN, while at Naples, was introduced at an assembly of one of the first ladies by a Neapolitan nobleman. While he was there his gold snuff-box was stolen from him. Soon after, being at another house, he saw a person taking snuff out of his box. He turned to his friend:—

"There," said he, "that man in blue, with gold embroidery, is taking snuff out of my box, stolen yesterday. Do you know him? Is he not a professional sharper."

"Take care," said the other, "that man is of the first quality."

"I do not care for his quality," replied the Frenchman. "I must have my box again. I'll go and ask him for it."

"Pray be quiet," said his friend," and let me get it back for you."

Upon this assurance the Frenchman went away, after inviting his friend to dine with him next day. He came next day, and as he entered, exclaimed:—

"There, I have brought your snuff box."

"Well, how did you obtain it?"

"Why," said the Neapolitan nobleman, "I did not like to make a noise about it, so I picked his pocket."

SPARKS AND SPLINTERS.

A YOUNG man recently inquired in a music store for a scared song-book, which he said was advertised.

DON'T abuse a local editor for not telling the truth. He may begin doing so the very day you are fined by the Recorder.

ONE old fellow says it is no use talking about hard times; most everybody in New Bedford seems to have money enough to go to see the centurion.

GEORGE asked Alphonso: "Why didn't you buy a waffle?" and the answer sparkled in Alphonso's eyes as he promptly replied, "Because I wasn't so waffle hungry."

"I suppose," said a quack, while feeling a patient's pulse, "that you consider me a humbug." "How odd it is," responded the patient, "that you can so accurately tell a man's thoughts by feeling his pulse."

A miss of 10 or 11, on her way to school, was heard saying to herself: "A noun is the name of any person, place, or thing, and if any of the girls have hooked that apple from my desk I'll raise a fuss with the whole school."

As a clambake was recently embarking for Palmer's Island, a gentleman on the wharf observed that the Jennie was not large enough to accommodate all. "No," was replied by another; "probably some will go by another convenience."

THERE are nearly a score of school-slate manufactories along the Delaware river, between Easton and the Water Gap. Five of them, at Slatington, make about sixty thousand cases of slates annually. This particular industry explains why the State was called Pencilvania.

AT the restaurant: Guest, who misses his usual waiter—"What has become of Auguste?" Proprietor—"Do not mention the name of the wretch, my dear sir; he used to polish the plates with his handkerchief. There is another like him. I know—I've been on his trail for a month—just let me catch him at it, that's all."

THE intelligence that a potato-bug was seen crawling up one of the Hamburg docks has been telegraphed all over Europe. The Paris Bourse is much agitated, and the representatives of the great Powers have temporarily suspended their negotiations of a peace between Turkey and Servia, and are taking tonics at short intervals.

THE judge asked an Irish policeman, named O'Connell, "When did you last see your sister?" The policeman replied, "The last time I saw her, my lord, was about eight months ago, when she called at my house, and I was out." The judge: "Then you did not see her on that occasion?" The Irishman answered, "No, my lord, I wasn't there."

"A RANDOM SHOT."

"AH PONTO, old fellow! How's the lumbago and how's all at home?"
"Better, thanks. I'm a bachelor just at present—wife's visiting her mother."
"Ah! then you're a fish out o' water?"
"Precisely—*hot* water."

1850 Twenty-Eighth Year 1877

OF THE

RURAL NEW-YORKER.

THE GREAT ILLUSTRATED AGRICULTURAL AND FAMILY WEEKLY has

REDUCED ITS SUBSCRIPTION PRICE

For 1877.

It is the Standard Authority on AGRICULTURE, HORTICULTURE and DOMESTIC AFFAIRS, and is replete with news and improvements of value to

The Farmer,	**The Dairyman,**
The Horticulturist,	**The Housewife,**
The Stock Grower,	**The Girls and Boys.**

In addition to these Practical Subjects and its Market Reports, several pages are devoted to Household Recipes, pleasant Stories, Reading for the Young, Sabbath Reading, Fashions, News, and all topics of interest to the family. Thus it comprises

TWO PAPERS IN ONE,

and cuts like a two-edged sword into the affections of the ladies and children, as well as the members of the family who seek instruction in their daily avocations.

A. S. FULLER, the celebrated Horticulturist, is Editor-in-Chief, assisted by E. S. CARMAN, the well-known Floriculturist and writer on Rural Topics, and X. A. WILLARD, the great practical Dairyman, who call to their aid as special contributors, S. B. PARSONS, Floriculturist and collector of rare exotics; WILLIAM ROBINSON, Editor London Garden; Col. F. G. SKINNER, Editor Turf, Field and Farm; Prof. CHAS. V. RILEY, Missouri State Entomologist; HERMAN STRECKER, Lepidopterist; WM. J. FOWLER, writer on Farm Economy; THOS. MEEHAN, Editor Gardeners' Monthly; JAMES VICK, the great Rochester Florist; GEO. SUCH, Floriculturist, JOSIAH HOOPES, noted Botanist; S. B. PECK, M. D., writer on Hygiene; HENRY HALES, the practical Poultry Breeder; L. A. ROBERTS, writer on Historical Subjects; and a host of other gentlemen equally celebrated and learned, as well as an efficient corps of Special Reporters, to keep the readers informed upon all subjects of interest to the Rural population.

From the pens of such celebrated writers the Practical and Scientific Departments receive life, while the Literary and Family Departments are under the careful supervision of a corps of experienced Editors and Contributors, who successfully devote their energies to making this Journal the superior of any in the land.

It contains each week sixteen pages of instructive and interesting reading, embellished with fine engravings upon all interesting subjects.

The Reduced Price is only $2,50 a year, postage prepaid by Publishers, and in clubs of ten or more only $2 a year.

The RURAL is so well known that little difficulty is experienced in forming a club in any locality, and every one is invited to form a club—thus securing their paper cheaper and benefiting their neighbors.

Every one can have a specimen copy FREE, and, if they desire to form a club, a list of Premiums to Club Agents, by addressing

Industrial Implements.

THE WEED MACHINE.

Among the various display Pavilions at the Centennial Exhibition, none is more attractive than that of the Weed Sewing Machine Company of Hartford, Connecticut, in Machinery Hall. Many of the other companies have filled their spaces with cabinet machines inclosed in cases of elegant workmanship which are replete with polished wood and gilt. Not so however, with the Weed Company. They display only such machines as are actually used, showing all their excellent points of utility and household excellence without endeavoring to attract attention to any gilded or silvered cases. Their chief display is in the work actually performed by their machine. As will be seen by the illustration given, they exhibit as one of the specimens the picture of the Battle of Bunker Hill—one of the finest pieces of workmanship ever done on a sewing machine. It embraces all the various kinds of work of which a machine is capable, and shows that in the various improvements which have arisen in this line during the last quarter of a century, the Weed Company has kept constant pace with the times.

The Centennial Judges appointed to investigate this branch of industry comprised men who have made this subject the study of their lives and who were conversant with every detail, good or bad, possibly existing in sewing machines. After a thorough examination and a series of severe tests of all the working parts, and a complete investigation of what it could perform, the Committee of Judges awarded to the Weed machine the Highest Honors awarded by the Centennial Commission, viz., the Grand Medal of Honor and a Diploma of Merit. In addition to this, the Judges made a Report in which they set forth the basis of such award, which was, among other things:

An excellent Shuttle Machine, possessing originality and simplicity of constructive detail, fine quality of workmanship and materials, and great adaptability to both cloth and leather stitching. This Report was also officially signed by J. R. Hawley, President; A. T. Goshorn, Director-General; Myer Asch, Assistant Sect'y. Those who are at all familiar with mechanics, will at once see by the construction of this machine that the claims of its manufacturers and the Highest Award of the Centennial Commission are based upon no pretexts, but upon a solid foundation. Some of the points of superiority are: (1) It has a link device, by which the needle and shuttle are brought to their respective extreme points at exactly the same instant of time, thus insuring perfection in each stitch entirely independently of the one preceding it, and this being done without the use of the cam, also insures greater speed with much less friction, both for work on cloth and leather—on light or heavy work: (2) The Weed Cylinder Shuttle carries much more thread than most machines, thereby saving both time and labor: (3) The upper tension is so arranged that the thread passes under a leaf, which oscillates so as to bind it at one end while it relaxes at the other, thereby obviating the incessant halts and stoppages caused by knots and kinks in the thread, which passes through without breakage or hindrance. The upper and lower tensions are so perfectly arranged relatively to each other that the difference in the appearance of the stitch from a full or nearly empty bobbin is entirely imperceptible: (4) It has an exceeding convenient spooler, whose simplicity enables it to be easily worked by a child: (5) By reason of all the principal bearings being capped, lost motion from wear and tear can be readily taken up and the machine kept constantly in perfect running order, thus avoiding the expense of replacing worn parts: (6) The feed is positive in itself without the aid of springs: (7) All the parts are thoroughly tested and passed upon before the machine is set up, so that there is no danger of getting any but a perfect machine. (8) Each individual part of the machine can be easily replaced.

CENTENNIAL EXHIBIT OF THE WEED MACHINE CO.

The above points of excellence in mechanical construction and device are the results of years of study, thought and experiment on the part of the experts in the employ of the Weed Company, and it must be a gratification to it to know that the Judges at the Centennial have indorsed their labors and expenditures by confering upon them the Highest Award which has been issued by the Commission. In addition to this, they have based their award largely upon the crowning glories of the machine, which are its "simplicity of construction," its "fine quality of workmanship and materials," and last, but not least, its "*adaptability to both cloth and leather stitching*," thus combining two machines in one, both being perfect in their results. The Rural has sent out to its agents as premiums for getting up clubs hundreds of these machines without the receipt of a complaint from one, and our files are today filled with letters of praise and thanks for so useful and excellent an adjunct to the home circle. So profuse have been the words of praise extended to it that the Company has named its machine the "Favorite," not as a catchword, but as a just recognition of the commendation accorded to it by the many people who use and admire it. And the past enterprise of the Company in improving the "Favorite" is a safe guaranty that the future will develop equal progress and entitle it to the motto "Excelsior."

Farm Economy.

WILL POTATOES RUN OUT?

BY PROF. W. J. BEAL, MICHIGAN AG. COLLEGE.

AGAIN, as usual we have raised many varieties of potatoes—this year about two hundred and fifty. Two moderate sized tubers of each kind were used as seed for six hills. They were planted on sod ground which had been seeded for several years. The ground was in good condition and had yielded two crops a year of orchard grass, clover and lucern. The soil was a sandy loam, plowed in the fall, cultivated and top-dressed with fine manure in the spring. In ordinary seasons the crop would have been a good one, but this year it was very light. The weather was very favorable till sometime in June when it suddenly changed from cool and cloudy to hot and plenty of sun light. Potatoes almost stopped growing on account of the sudden change.

In former years the potatoes in small quantity, here noticed, were planted on old garden soil. I mean on soil which had been in cultivation for some years in succession. They have been manured in a variety of ways, not very heavily, but generally with a good dressing of fine manure and ashes. The potatoes have never been planted on the same piece of ground in two successive seasons, but they have been shifted about on similar soil, on different parts of about five to eight acres. Two years ago the number of varieties was much increased. Previous to that time, for some six years, there had been fifty to eighty varieties in the garden. For some years the yield has been carefully noted, usually by weighing the tubers of each hill, or each set of hills. Of course we should expect a variation in the yield for different hills in the same year of the same sort, even if we treated them in all respects as nearly alike as possible.

The chief object in planting so many kinds in this manner, is to watch the changes from year to year in yield, health, quality, etc. We all know for family use, that we cannot measure the value of a crop of potatoes by the scales or bushel-basket, still the yield is of great importance. The ideal potato must, at least, be productive of even-sized tubers close together in the hill, with few or no small ones. It must have full eyes and even surface, a light or red color or spotted, must be of good quality for all seasons of the year; and now that the beetles have become so troublesome, the model potato should ripen early in the season.

It would require needless space to give here the weight of each sort. This season, the greatest yield for six hills was nineteen pounds and seven ounces; last year 21 pounds and 1 ounce for three hills. On no two years has the same variety headed the list in productiveness. This year it was Long Pond; last year, Early White; the year before it was Climax. In comparing the yield for the past two seasons, I find all those yielding well this year, yielded well last year; and that those yielding lightest last year, hold somewhere near the same rank this year.

In the report for 1868, before I came to the college, the comparative yield is given of fifty-five varieties of potatoes. With few exceptions the tubers of these have been used on the garden ever since. They have all decreased in yield, notwithstanding the garden is now much more productive of most crops than it was eight years ago. In 1868, Casco was reported as yielding, at the rate of 340 bushels to the acre; last year three hills produced about half an ounce, although it was a remarkably good year for the yield of potatoes in our locality.

This year it ran out entirely. We did not get one tuber, not even a small one. In 1868, Colebrook gave at the rate of 155 bushels to the acre; Davis Seedling, 276 bushels; Prince Albert, 262 bushels; Coppermine, 176 bushels. Last year they yielded respectively, for three hills of each variety; Colebrook, 2 pounds 9 ounces; Davis Seedling, 5 pounds 6 ounces; Prince Albert, 1 pound 11 ounces; Coppermine, 4 pounds 9 ounces. This year, Colebrook yields for six hills, (twice as many hills as reported last year) not one tuber, large or small; Davis Seedling, not one tuber; Prince Albert, one-fourth of an ounce—a few very small tubers; Coppermine, 1½ ounce. Other examples could be added of a similar nature.

The question as to whether varieties wear out has long been discussed. Mr. KNIGHT, the famous English horticulturist, maintained that they did, and gave what he supposed were good illustrations to prove it. Others, since his time, as well as his cotemporaries, believed otherwise. I have seen Indian corn which had been kept for ten or more years on the same farm. Although the farm was a good one and the land well managed, the ears of corn grew shorter, the kernels shorter and rounder at the ends. The corn mentioned was the White Dent, in the latitude of Lansing, Michigan. I should be glad to hear from others who have kept the seed continuously on the same farm for many years. It is a common notion that sheep do better when changed occasionally from one farm to another or from one neighborhood to another, even where they were under the care of a good master before changing.

It would be interesting to know whether any of these varieties of potatoes which have been kept here for some years would revive, if their seed were sent to distant portions of our country and well treated. To test this point, last spring, I sent tubers from our garden to Kansas Agricultural College and another set to Ohio Agricultural College, at Columbus. The Professors of agriculture in each the same as we have treated them of those two institutions agreed to treat them and report the result this fall for comparison. It may be said that the potatoes in the cases noticed above, ran out because they were not fairly treated, that they were not properly fertilized or cultivated, yet I do not think this the only cause. Of the newer sorts of potatoes, as lately of Early Vermont, Compton's Surprise, Brownell's Beauty, etc., planted on similar ground with similar treatment, we have raised excellent crops nearly every year. In this connection, I may mention a fact, though some will doubtless find other explanations than the degenerating of varieties. In many parts of Southern Michigan the wheat crop is lighter than it used to be. The usual explanation given is that wheat has been too often raised on the same ground. But, in many instances which have been noticed by our most observing farmers, a newly-cleared piece of timbered land for its first crop does not produce nearly so well as in early times, say thirty years ago when the country contained much land cleared every year.

INSECTS OR BIRDS, WHICH?

IT is often very difficult to determine which are the most destructive to farm and garden crops, the insect-eating birds or the insects themselves. It sometimes happens that the birds in searching for insects destroy the infested plants at the same time, and then the question arises, Which of them are the more injurious?

A writer in a late number of the Mark Lane Express, in describing the ravages of certain insects upon the turnips in England, gives an illustration of the damage insectivorous birds may do to crops when searching for their natural food. The grubs found in the roots of turnips are much sought for by the rooks and other birds, but singularly enough, however valuable their services may be at other times in devouring the larvæ of noxious insects, they cannot at this particular time be permitted to alight among the plants, as their doing so would prove certain destruction to the portion of the field on which they remained but for a very short time, and if allowed to come and go, without restriction, in extreme cases, they would not leave a single plant.

In searching for food every plant at all injured by the grub or worm is broken off, and those perfectly sound and as yet free from attack are pulled up by the root, every plant being taken in succession, and the inevitable consequence of permitting them to remain is a broad space of red earth utterly destitute of vegetation. Nor are the rooks the only birds, usually the farmer's best friends, that will perpetrate incredible mischief at such a critical time, as the missel-thrush is equally fond of haunting the turnip fields, particularly during the earlier stages of growth, when the plants have attained the rough leaf, and they can be caught hold of firmly; and again when newly thinned and only beginning to recover.

At these periods, a flock of missel-thrushes, numbering not more than from twenty to thirty birds, will in two hours from daybreak, clear a quarter of an acre as effectually as if a turnip had never been sown there, so indefatigably do they work in their destructive operations. On examination it would almost appear as if each bird took a line for itself, and made a point of examining every plant as it went along; this too minute examination of course resulting in the total loss of the crop.

From the above view of this very important matter, it will be seen that by protecting the fields from birds at the very time the grubs are committing the damage, there is some chance of a part of the crop being left on the ground, whereas, if they are permitted to alight and remain undisturbed, the united action of both will be apt to destroy all. If rooks, particularly, get the habit of remaining on a field on which grubs are present, without danger of disturbance, it is in vain to resow the patches which have been cleared, or plant swedes, cabbages, or any other available esculent, as every thing will be pulled up before it has time to get hold of the soil, and the labor and cost must go for nothing.

It is quite as reasonable to expect that there will be a stage in the growth of root crops, when it will be dangerous to permit such strong and active birds to approach them, and necessary to ward them off accordingly, as it is to assume that the most highly-esteemed songsters, whose melodious strains are the delight of every dweller in the country, will for a few weeks during the fruit season become a source of very severe loss to the horticulturist, and must be kept away by protecting the trees with nets, or if very extensive, as in a cherry orchard, by the use of the gun almost continuously.

Notwithstanding that the services of birds are inadmissible in clearing the soil of grubs and worms, while the plants which they are destroying remain young and delicate, the farmer may do a great deal in self-protection by hand-picking—a process which can be much more easily carried out than might appear likely at first sight. The first break in the cuticle of the incipient bulb is instantly followed by a curl on the extreme point of the foliage, caused by the sap being checked in its upward course by the cutting of the vascular tissues, this slight change in the appearance of the plant infallibly betraying the whereabout of the destroyer.

Taking this change as their clue, a couple of smart lads, provided with a short piece of pointed stick, and a tin or other light vessel in which to deposit and carry away the grubs, will save a vast number of plants in one day, the value of the food thus saved from total destruction being far and away out of all proportion to the slight expense incurred by this simple process. The grubs are got without the slightest trouble—the removal of a small portion of earth round the root at once exposing them, a minute being scarcely occupied by each operation. The young plant has a wonderful power of recuperation, as even although it has been pretty deeply cut, the wound becomes at once cicatrized, the leaves again sympathise, become erect, and recover their bloom; and in about a week the entire plant has recovered the hue of health, and grows vigorously.

Various reasons have been assigned for the presence of grubs in such immense numbers, but all more or less local in their character, as for instance, over-rich manure, large applications of bone dust, the decaying turf of very old grass-land recently broken up; but as they have appeared this season under every possible condition and character of soil, manured and unmanured alike, on land several years broken up, as on that from which only one crop has as yet been taken, after lying in grass for twenty years, the whole question as to how they can appear in such myriads, and be so universally diffused over an immense extent of surface, must be referred to the entomologist, who makes such abstruse subjects his life-study.

FARM MATTERS IN NORTH CAROLINA.

RIDGEWAY, Warren Co., N. C., Oct. 16, '75.

THE number of years that I have been a subscriber and reader of the RURAL is sufficient evidence of the appreciation which myself and family feel for it, and as a partial remuneration for the benefits received, perhaps a few lines from this section may be interesting to some of your readers.

This county was, before the war, famed for its fine crops of wheat and tobacco, those two being the principal market crops. Since the war the lands have been mostly cultivated by the freedmen, the landlord drawing one-fourth the crop as rent. The *rotation* is corn one year, corn the next year, corn the third year and so on to the fifteenth, unless the poor over-worked soil refuses to produce "nubbins," when it is turned over to the blackberry bushes &c. for rest. There are thousands of acres of cheap lands here for sale, plenty under cultivation and in tracts of from twenty-five acres up to thousands. We want men with capital and good, sound, common-sense ideas of farming. Men who understand the breeding and care of cattle, sheep and swine, and the making and preserving and application of manure, can make money here, provided they *have* the capital and judgment to start aright, and the energy and perseverance to carry it through. We buy too much commercial manure, the whole crop of cotton, in some instances, being required to pay for it, throwing away labor entirely.

Wheat this year is a good crop, from 10 to 25 bushels per acre. Cotton light, now selling for 2¾ to 3 cts. per pound in the seed. Tobacco short, from scarcity of plants and drought at planting time. Dairy products bring good prices, and the business might be made profitable by managing it on northern principles. The common cows are very inferior for both milk and beef. For the information of Mr. WILLARD, if he has never been through the South, I find the people here say and believe that a cow yielding from six to eight quarts of milk per day "gives a heap" and of that the calf or "starter," which is often a year old or more, gets one-half. It seems surprising to many that the milker can get any milk at all unless the calf draws its share at the same time.

Our State Fair occurs this week. Perhaps I can send you some notes thereon, if you have no one there more competent. M. B. PRINCE.

The Herdsman.

GOAT BREEDING AND REARING IN NORWAY.

GOATS may not be very profitable animals for America, still there are countries where they furnish a large amount of valuable food for the inhabitants, and considerable for export. Any one who has eaten a good goat's milk cheese, will probably agree with us in saying that there is none better, and little as good. In speaking of Goat-Breeding in Norway, the London Field says:

"Side by side with the sheep and cow, the goat is still extensively raised in many parts of Norway, especially on those farms containing a considerable area of mountain pasturage and wood. With a view to render its fleece more valuable, a cross with the Angora has here and there been tried; but the common unimproved breed of the country, of somewhat angular appearance and hardy constitution, is the one still generally met with. In those instances in which milk is the most important product, the goats are not unfrequently kept along with the sheep, sharing in winter the same shed or stall, and being treated much in the same way. When, however, the flock is sufficiently numerous to render it worth while to separate them from the rest of the live stock and put up accommodation better suited to their wants, the building in which they are housed is both larger and loftier. The goat needs a good deal of air, and, provided it is dry, it can stand cold well. What does not suit it at all is a moist and vitiated atmosphere. Now and then the practice is followed of tying up the animal, and occasionally the stable is divided into a number of stalls.

In selecting the goats for stock purposes, the preference is given to the biggest framed and finest specimens, with large, well-formed horns, and, if possible, the breeding season is so arranged that all the kids are born as near as may be about the same time.

As a rule, the kids are allowed to suck their dams for a month or six weeks; but during that time the herdsman now and then milks the latter—more particularly the young mothers—in order to accustom them to be handled by him, and (by drawing out the last drops in the udder) to promote an increased lacteal secretion. He can generally manage to attract them by offering a small quantity of salt, and after a time, when the weaning is over, they come to the milking place regularly of their own accord. The operation of milking is performed by the goat-herd placing himself astride and backwards way on the animal's back, and bending down so as to reach the udder.

Kids destined for the butcher remain with their mothers somewhat longer than those not intended to be sold early; but where this can be done without detriment to them, the farmer endeavors to wean all his young stock before the period arrives for the flock to be driven to the distant pastures. The herbage of the latter is much sweeter and richer than that of the grass lands in the more immediate neighborhood of the homestead, and it is for this reason that it is desired, if possible, to arrange for the goats to be on them during the time they are milked for the dairy. The kids which have not been weaned when the flock leaves its winter quarters follow their mothers to the lower slopes or "almen," and very soon begin nibbling the herbage and green foliage of the trees. It is an old rule not to have recourse to the "mouth-piece"—a piece of wood fixed in the kid's mouth to prevent sucking—until the trees and bushes have put on their spring mantle of green.

The roaming habits of the goat render the shepherd's (or rather goatherd's) task on the almen no easy one, and he is anything but the idyllic pipe-playing being known to us on canvas. At night he has to drive the flock into an inclosure, and during the day to milk the goats twice, the first time before turning them out in the morning.

The quantity and, of course, also quality of the milk yielded varies with the mode of treatment, character of the pasture, and milking properties of the individual animal; from 1 to 2 kilogrammes (2¼ lb. to 4½ lb.) per diem, the goats remaining in milk five to six months. A goat furnishing less than 2¼ pounds, or its equivalent liquid measure (Mr. Thesen, our Norwegian authority for the facts in this communication, only gives the quantity in kilos.), would not be considered worth keeping.

As to the peculiar smell and flavor of goat's milk, which is doubtless due to the presence of capric acid, this is stronger in the case of some animals than in others, and depends, to a great extent, on their food. It is most marked when the latter consists chiefly of the young shoots and foliage of trees, and much more observable in cream and whole milk than in skimmed ditto. In spite of the comparatively large proportion of cream in goat's milk, and the facility with which

it could be separated and kept fresh, by the application of the "cold-water" system of dairying adopted (in the case of cow's milk) in many parts of Norway, butter is rarely, if ever, manufactured from it, the common plan being to add it to the whey in making "mys" cheese.

Occasionally "mys" cheese is manufactured from the whey of cow's and goat's milk mixed, and the milk is sometimes allowed to turn sour. The addition of cow's milk whey facilitates the process of manufacture, but the article thus produced has a less piquant flavor and fetches a lower market price. To make a good genuine "mys" cheese of sweet goat's milk whey only, or of the latter supplemented by its cream, requires considerable care and judgment, and the difference in value between the best quality and the ordinary product shows that the additional attention bestowed on the former is appreciated by the consumer.

Dairy Husbandry.

THE MILK SUPPLY OF CITIES AND LARGE TOWNS.

The supply of fresh milk to cities and villages is occupying a good deal of attention in this country and in England. The plan of keeping large dairies in the immediate neighborhood of the city, as is now practiced to a considerable extent, is open to serious objections. The lack of space often causes the animals to be overcrowded, and from want of exercise and proper ventilation, together with a defective diet, the herds not unfrequently become diseased, and their milk, of course, is not a healthful article of food.

The fact that cows in such establishments require to be changed frequently on account of failing health, their places being filled by animals fresh from the country, is good evidence that disease or a low tone of the system has been prevailing for some time before it becomes apparent to a casual observer. This plan, then, on sanitary grounds, cannot be commended. The sale of milk to city contractors has been the source of great dissatisfaction to milk farmers, and strenuous efforts have been made, from time to time, to regulate the trade on a fair basis. But somehow the contractors always get the best end of the bargain, and the milk farmer, in the end, yields to the situation.

In England there is an effort being made to organize a new plan for milk supplies. Mr. Livesey, in a recent letter to the Hereford (Eng.) Times, says:

"We all know that farmers are loth to make changes and slow to get out of the old ruts in which they have traveled so long, often enduring manifest loss rather than resort to any change which seems to some extent to revolutionize the long-existing arrangements. This, coupled with other matters, shows that if our large towns and cities are to get an abundant supply of genuine milk, the consumers must make the first move in the matter and induce the sellers to follow."

And he suggests that the best way to do this is the establishment of milk-supply companies, where the shareholders might be very largely the customers and supporters. He gives a brief account of the Aylesbury Dairy, which has become noted for its reliability in furnishing a large amount of *genuine milk* to its customers in London. This Company has a share capital of £50,000 ($250,000). It has one factory at Swindon, another at Bourton, near Shrivenham, and a splendid building in London, which is the headquarters of the selling department. Above 1,000 gallons of milk are distributed daily in London to about 5,000 families, 30 light carts being employed in the delivery of the milk. Besides the retail trade, a vast quantity is sold to the trade at the railway station, the total quantity used by the Company being about 22,000 gallons daily. The milk is furnished from over 50 farms, the contracts with the farmers being models of stringent dealings for the security of cleanliness and purity. No milk from any cow out of health, or just calved, or just deprived of her calf, or just bought, is to be sent. All milk is to be cooled in a Lawrence refrigerator, before dispatch, to 60° Fahr., and none is to be sent which has been bought. The sender is to be liable for all damages arising from neglect of any of these conditions. But this is not all the precaution taken for the security of customers in preventing milk from filthy farm-houses, or where the people or cattle are diseased. To meet these conditions a Sanitary Inspector is employed by the Company, whose duty it is to make inspections of all the farms from which milk is furnished. The Company also have, in addition, a Medical Board that meets quarterly to receive the reports of the Inspector and to make such suggestions on these as may occur to them. The Company have also a well-arranged system for preventing those who deliver milk by retail from diluting it. Thus, it will be seen, every possible precaution is taken by the Company for securing genuine and wholesome milk. Mr. Livesey urges that the Aylesbury plan be adopted on an extensive scale, and that the milk be purchased from farms distant from the place of consumption and lying in the vicinity of the railways, since the milk can be produced more cheaply from such farms than from those near the city, where land is expensive.

The establishment of factories along the line of the railways where the farmers deliver their milk is an important feature in this plan, the advantages of which we have heretofore urged in the Rural, because, as will be seen, all surplus milk, not needed from time to time for consumption, can be utilized at the factory by being converted into butter and cheese. By this plan the milk farmer is protected from the abuses to which he is now subjected by the contractors, who, to avoid loss on surplus milk, either return it to the farmer or dock him in damages, on the ground that the milk is not sweet or is otherwise defective.

Again, some plan is needed whereby consumers can be protected from the dilution and adulteration of milk. It has been estimated that to the total supply of milk in New York City water is added to the extent of one-quarter, thus making consumers pay one-fourth more than they would if the milk were pure and unadulterated. The frauds practiced in this way upon consumers have become so onerous that attempts have been made to check the abuse by applying the lactometer test. But it is believed that only the worst cases are thus reached, and that we must look to some more substantial method for breaking up this unmitigated swindle. We should be glad to see the plan suggested inaugurated in this country, and we think a company furnishing good, honest milk could be managed so as to return good dividends to stockholders.

Another important feature in the plan proposed is the capacity to furnish cream in considerable quantities. At the factories a certain portion of the milk may be set for cream and the skimmed milk converted into skimmed cheese.

We believe the time was never more favorable than now for inaugurating this movement. The great desire in cities to obtain pure milk and the knowledge that milk is grossly diluted, together with the low price of cheese, rendering it easy for milk to be obtained in the country at comparatively low figures, would all seem to favor the success of such a movement. Let all the precautions be taken to put upon the market genuine milk in the best possible condition and it will be a boon to consumers, while all parties interested, from the seller to the milk farmer, can be amply remunerated.

THE GREAT CHEESE SHOW IN CANADA.

The Canadian Cheese Fairs seem to have been a success from the first. They are held under the auspices of the Ontario Dairymen's Association, which receives annually an appropriation from the Government for premiums and for the advancement of dairy husbandry in Canada. The recent Show at Ingersoll, from all accounts, appears to have been one of the most successful of any ever held by the Association. There were 200 entries made for competition in the various classes, and as the cheese generally was of the finest quality, the competition was sharp and the awards not easily made. The first prize of $100 for the six best factory cheeses—two made in the months of July, August and September, respectively—was given to Peter Dunn of Ingersoll; the second prize, $75, to Jas. Elliott of Brownsville; the third prize, $60, to J. A. James of Nilestown; the fourth prize, $50, to H. Parrington of Norwich; the fifth prize, $40, to J. Anderson of Wyoming; the sixth prize, $30, to A. J. Herrick of Acacia; the seventh prize, $20, to C. E. Harris of Newry; the eighth prize, $10, to E. Hunter of Mt. Elgin; the ninth prize, to J. E. Hupkins; the tenth prize to Wm. Augur; the eleventh prize to Adam Bell; the twelfth prize to Wm. Waddell; the thirteenth prize to R. Facey; the fourteenth prize to E. N. Hupkins—each receiving $5.

For the best two cheeses (colored) made on the 17th and 31st of August, the first prize, $25, was awarded to A. J. Herrick; the second prize, $15, to Jas. Elliott, and the third prize, $10, to Peter Dunn.

For the best two cheeses (white) made on the 15th and 20th of August, the first prize of $25 went to John Wilkinson of Verschoyle; the second prize, $15, to Peter Dunn, and the third prize, $10, to E. N. Hupkins.

For the best three cheeses (colored or white) made at any date—first prize, $25, to A. J. Herrick; second prize, $15, to Peter Dunn; third prize, $10, to A. Bell of Innerkiss.

For the best five Stilton cheeses—first prize, $20, to E. Harris; second prize, $10, to John Rowart of Nilestown.

Best five Loaf or Truckle cheeses—first prize, $20, to C. B. Lambert of St. Thomas; second prize, $10, to Philip Andrew of Cromarty.

Best two cheeses, any make or date, artificially colored—first prize, $20, to Margaret Morrison of Newry; second prize, $10, to John Rowart.

Best three dairy cheeses made any time in August—first prize, $20, to Mr. Ballantine of St. Mary; second prize, $10, to R. Facey of Hornettsville; third prize, $5, to Thomas Hawkins.

Best two firkins of butter, first prize, $50, to Wm. Dunn of Ingersoll; second prize, $30, to Jas. Lund of Oxford Center; third prize, $15, to V. Picht.

Best crock of butter—first prize, $20, to Robt. Nicholl; second prize, $10, to Benj. Thompson of Florence; third prize, $5, to Wm. Harris of Mt. Elgin.

Best basket butter, plain roll or print—first prize, $20, to Robt. Nicholl; second prize, $10 to Daniel Hayes, and third prize, $5, to Benj Thompson.

It will be seen the prizes were quite liberal and sufficient to induce a large competition. Cheese Fairs, when properly conducted, are of great advantage in stimulating exhibitors to excel, and such good results have come from them in Canada, in promoting improvement in dairy manufactures, that the Canadian Government has had the good sense to make liberal appropriations for this object.

The cheese Shows of Canada are managed for the benefit of Canadian dairymen, while on this side the Dairy Exhibition at our great Centennial has been prostituted for the benefit of a "Ring" and will be of no advantage to the dairy interest of the country, either in stimulating to improvement or in giving us a reputation with foreign nations.

COMPARATIVE VALUE OF MILK FOR CHEESE IN ENGLAND AND AMERICA.

In England, when cheese is worth 70 shillings sterling per cwt., the dairyman gets about 13¼ cents per gallon for his milk. This is a little over 3¼ cents, gold, per quart for milk when made into a good quality of cheese. In comparing prices abroad with prices in the United States, we find that milk nets the dairyman considerably less money here than in England. If we assume that 10 pounds of milk on an average make one pound of cured cheese, and that 11 cents per pound are realized for it, after deducting the expense of making, boxing, etc., to fit it for market, we can easily calculate the value of our milk when it is made into first-class cheese. A gallon of milk, wine measure, weighs 8 pounds 9 ounces; consequently 10 pounds would make one gallon and one-third pint of milk. The milk, then, would net the dairyman a trifle less than 2½ cents, currency, per quart—a difference of over ¾ cents per quart in favor of English dairymen. But the latter complain that cheese-making at these figures leaves only a narrow margin of profits, and hence that all low-priced cheese will not pay. As the best American cheese has ranged in England during the past year at an average of from 60 to 66 shillings, sterling, per cwt., the effect has been to send down the price of common grades of English cheese to quite a low figure. We notice that Cheshire medium was quoted on the 1st of October at 44 shillings, sterling, the cwt. It is evident that cheese at such rates, on the high-priced lands of England, cannot pay, and hence we are not surprised to learn that an effort is being made to change to some other branch of farming.

The time is not distant, we think, when cheese-making in England will be narrowed down to "fancy" or high-priced qualities. Our efforts should now be directed to the manufacture of an article that will take its place alongside of the fine English cheddar, which sells at from 80 to 92 shillings per cwt. There is no good reason why we should not be able to produce as fine goods as any in the world. We already have the skill in making, and what we now most need is skill in curing and better curing-rooms.

THE CHEESE SHOW AT FROME, ENG.

We have reports of the great Cheese and Butter Show at Frome, Somersetshire, England, in September. The cheese was exhibited in a monster tent 170 feet long by 45 feet broad. Four stages ran the full length of the tent and one across the end of it, and on these were placed from 700 to 800 cheeses. Here were found the very finest cheeses that the County of Somersetshire produces. Some of the cheddars exhibited were 16 and 17 inches deep and of the finest flavor that cheese can possibly attain. There was a great variety of goods on exhibition. Besides the cheddar, there were the Stilton, the Lancashire, the Gloucestershire, the Wilts, the Dorsets, and others.

The inhabitants of Frome take great interest in these Shows, and this year large arches, profusely decorated with evergreens and flowers, bearing a variety of mottoes and surmounted with flags, spanned the principal streets, while pendant from almost numberless windows were flags of various styles, shapes and colors. The fronts of some of the shops were festooned from the lowest to the highest stories with evergreens, intermixed with flowers and flags.

The Judges for cheese at this Show were Messrs. J. D. Corman and S. S. White of London, W. Livesey of Preston, and H. S. Underhill of Oxford.

The Naturalist.

OSTRICH FARMING.

A correspondent of the London Times in speaking of Ostrich farming at the Cape of Good Hope says:

"Permit me in your valuable paper to make a few remarks on one of our most lucrative employments at the Cape, and which is so little known of in England, and that is "ostrich farming." Taming the ostrich and making it a domesticated bird has only been attempted of late years; formerly they used to run about wild on the plains of South Africa. They were shot by the traders and natives for their feathers until they had almost become extinct. I have often heard my native servants talk about the number of birds they have killed and eggs they have eaten, but that is a thing of the past. They are now watched by the farmer most accurately until the young are hatched; these are then taken from their mother; the eggs that are not hatched are taken home and generally put under blankets to complete the incubation. The birds are generally sold when they are a week old for £10 each to those farming them; they are fed on lucern, clover, or any grass stuff from the garden; they are housed at night time, and are put out during the day when the sun is warm. When a month old, they are taken out by a boy to the fields, on a pasture peculiar to the country, and will feed about the homestead with the poultry to the age of two years. After that age they have to be kept in paddocks.

The birds commence laying at the age of three and four years. They are attended to the same as wild birds; but when we find a hen has more eggs than she can cover, they are placed in an incubator, where it is interesting to study the process of incubation.

Birds are kept solely for the feathers. They are plucked every eight months, and will average at each plucking £10 worth of feathers after the first plucking, which are chicken feathers, and are not so valuable.

The Cape never offered a better time than the present for enterprising young men, as farms are being let at a nominal price; but I should advise those who intend going ostrich-farming to rent part of a farm from one who is engaged in that pursuit, because it does not require much ground, and at the same time he will be able to gain information."

THE PLACE OF ANIMALS.

A writer in Our Dumb Animals very pertinently remarks that the doctrine that animals are mere automatons—bundles of "instincts" to be wrought out into actions in a mechanical way—cannot explain all the observed phenomena of their lives. It is sometimes urged that we publish too many anecdotes of animals; that these things may do to amuse children or excite the sympathy of the sentimental, but have no substantial use. The reverse is true. These anecdotes, illustrating the conduct of animals under exceptional circumstances, bear directly upon the problem of their true place in the scale of life. Whenever it is shown that any creature under pressure of new conditions puts forth special powers, however feeble, to meet those conditions, a gain has been made; something we call reason, in talking of ourselves, has been manifested. The action has ceased to be automatic. The animal is not a machine; a mere blind force working through an organism would do nothing of the kind. Our file of anecdotes is an arsenal of facts, showing that within the range of their physical adaptations all animals do think—the mental phenomena, though limited, are in kind the same as in men. To illustrate would be to reproduce these anecdotes. It is better to ask our readers to observe the life that is going on all around them; the closer they observe, the surer will be their conviction that this must be the case.

Showers of Frogs and Worms.—Something similar to the meat showers of Kentucky are the worm showers in Norway. The *Morgenblad* of Christiana states that this singular phenomenon was observed there after a recent violent storm, a number of worms were found crawling on the snow, and it was impossible to find any crevices in the ground from which they might have crept out, as the earth was frozen. Both the frogs or lizards were lifted up by wind-storms, having their centers in distant localities, carried up in the air and dropped again in other places.

The Poultry Yard.

POULTRY KEEPING IN ENGLAND.

DEAR RURAL:—Though far from home, I receive my RURAL regularly, and on breaking its wrapper, as I sit in my cozy breakfast room, I almost imagine that I can scent "a breath from home," from between its fresh pages I am glad to see that you have opened a corner of your paper for the "Poultry" interest, and its excellent articles have been read here with much pleasure, and, I may add, freely but pleasantly commented upon.

In the English agricultural papers—I cannot say "our" papers—for fifteen years in England have not made me less an American—the poultry interest figures largely, and it has often occasioned remark, here, that the matter is not, apparently, one of greater interest to American farmers. Here, one of the first things to strike the attention of the "city" visitor in an English farm, is the fine appearance made by the barnyard poultry, and the farmer's wife, or daughters, will tell you, as they point with pardonable pride to the handsome flock, that "'usband an' I, an' children, we thinks all an' all on our chicks, we do; an' they be 'an'some, ben't they, zur?" They are, indeed, and well may "usband an' children" and wife be proud of their broods.

They will tell you, too, that they are well fed and cared for, and when you ask "does it pay"—the universal American standard—the good wife will answer, "Aye zur, it do, an' pay well! We fill 'e potato pot for chicks, and chicks they fill it twice for us with eggs. Aye, zur, it do pay."

"We fill 'e potato pot for chicks." There lies the secret. The chicks are *well fed*, and it would be well for our American farmers if they would learn this lesson from their English cousins. A few days since I was at Bingley, a quaint old town in Yorkshire, and remained over night at a snug little inn—"The Golden Fleece"—where I was accommodated with a room, looking out on the pleasant, cheery inn yard, with its stables and kennel, its dove-cote and its moss-thatched well. One of the first sounds I heard, as I lazily drew my curtains in the morning, was the gleeful cackling of the chickens in the yard, and the merry call of the children of the household, as the flock was summoned for its early breakfast. I pulled to one side the heavy curtain and looked out on the scene, and a pretty one it was. The chicks had run in from the hedges and mossy lanes close at hand, and were clustered about the children whose little legs were half bared as they held up their short dresses half filled with grain and "bits" with which to feed their pets.

In England the fowls are largely, the care of the children, and admirable little matrons they are in watching their charge. The fowls are not left in the cool autumn mornings to look for their breakfast, in the chance droppings from the manger, or any "odd luck" upon which they may come, after long search, as is too often the case on the American farm, but a hearty meal is given them in the early morning, and then they are sent out, light-hearted and cheery, to begin their rambles for the day, and to search the fresh hedges and lanes for "a good digestive" to their morning meal!

How different is it on many American farms, where the farmer is too likely to leave the chickens to shift for themselves. He seldom throws them more than a handful of grain, and yet complains that "them 'ere chickens is always hungry!" They must forage from dawn till dusk, and "keep on the run" too, in order to earn scanty daily food, and yet he expects them to lose an hour of that precious daylight, laying eggs for him! He searches high and low for stolen nests, "for them 'ere chickens is off to the woods the first thing every morning" he says, not remembering that the poor, hungry things must travel far and near for that which is denied them at the stable door—enough to eat. "Them pesky chickens don't lay worth a cent and I wish all their heads were off—for chickens don't pay nohow! They're off in that bit of timber now, and I can't find one of them, and I believe the hull lot has got nests hidden up there just to spite me!" And while he is cursing his hungry flock they are all hard at work at the bottom of little ravines and cuts looking for a scanty meal in these cool autumn days.

The good wife's plans were the best. "Fill 'e potato pot for chicks, and chicks 'll fill it twice for us with eggs—aye, zur, it *do* pay." And it *does* pay. Try it, and see for yourself. I have tried it, and the answer was in the affirmative, and a decided affirmative too.

London, Eng., Oct. 5. GEORGE DERBY.

BREEDING FOR QUALITIES NO. 1.

EVERY observing breeder will notice some peculiar tendency in each variety of his stock, to breed to certain colors or admixtures of colors, some of which he wants to avoid entirely; others he would regulate to certain proportions or markings, in order to come nearer the points laid down in the standard of excellence; or to the qualities generally accepted as constituting fine fowls of any variety.

Breeders of white fowls have black and yellow to contend with. Breeders of black and white varieties, as Silver Hamburgs, Silver Laced, Houdans, Silver Polands &c., have the proper proportions of each color to maintain. Of black fowls, that strong brilliant metalic shade, is the objective point, also to avoid splashes of white. Those breeds of yellow, red, brown and black, such as Game, Brown Leghorns, Gold Laced, Golden Hamburgs, Partridge Cochins, Brahmas, &c., are all liable to breed more or less "off feathers," as it is termed by fanciers. Black-breasted birds, as cocks of Silver Gray Dorking, Dark Brahmas, Duck-wing, Game, &c., are very liable to white splashes on the breast. The hackle feathers of Reds are liable to run yellow near the tips. Obtaining and maintaining the desired uniformity is the breeder's aim. It is my object to look into the laws of nature as far as we know them, and to follow out as far as possible those which tend to the desired ends.

There is no doubt that our fine breeds of domestic fowls are all descended from one common origin, as time and science have proved of the domestic pigeon. The theory of crossing with other species of birds, to produce a breed, is fast giving way. Some people still cling to the theory, that game fowls are improved by crossing with the Pheasant, common Ducks with the Musk or Brazilian Duck &c.; but after careful watching for many years, I have never been able to find a single instance of such a crop, ever breeding again. I know this is hard for many to believe who have not taken the trouble to investigate, especially in these Darwinian times, when so many are ready to believe in the commingling of species, yet *not one* single specimen bred from animals so crossed is shown as a result of their scientific experiments.

H. HALES.

HOUSE SCRAPS FOR FOWLS.

As the weather gets colder, fowls are cut off from many insects, fruits, seeds, &c. To compensate for this, it is necessary to supply your birds with an equivalent in *nice bits*. This can often be done with scraps from the table, leaves of vegetables, &c. This is especially required if fowls are limited to a small run, for though every one who keeps fowls may not own a five-acre lot for them to run in, yet he can keep them in health and with profit to himself, by giving them proper attention.

When fowls are supplied with the change of food they require, they seldom peck off each others' feathers, but if they once commence it is very hard to break them of such a habit. Pieces from the table are used with more profit to feed poultry than pigs, and they supply that variety which nature requires. H. H.

Farm Machinery.

THE GRANGE MILL.

THE cost of grinding grain is one of the heavy expenses of the farm, and the loss is still greater if it is used or fed unground. A really effective and easily-managed mill is one of the most profitable machines a farmer can use. We illustrate in this issue the GRANGE MILL, made by HENRY H. SWIFT, Millbrook, N. Y., which has been devised to combine efficiency with cheapness and convenience. It is capable of a wide range of work, and can be used with any sort of power and readily regulated to use a greater or less amount.

This mill is recommended, by responsible parties who have used it, to do all that is claimed for it. Any farmer can readily sharpen it when worn or dulled by long use, which is a great advantage, in a pecuniary point of view.

THE GRANGE MILL

We recommend our readers to investigate the points of superiority claimed for this mill, and the most direct way to do so is to write to the manufacturer for any information desired, which, we have no doubt, will be furnished promptly and cheerfully.

The Vineyard.

PACKING GRAPES.

A CORRESPONDENT of the Vinton Co. O. Record gives the following advice, in regard to packing grapes:

"I wish to offer a few suggestions to the grape growers in reference to packing grapes for shipping to market. The manner of packing has much to do with the price obtained.

In the first place grapes should never be gathered when wet with dew or rain. The best method that I have tried for gathering grapes is to take a pair of sharp shears (pruning shears answer very well) or a sharp knife with hooked blade; take hold of the bunch with one hand and cut the stem of the grapes with the knife or shears held in the other hand, and take off all decayed or green berries; lay it carefully in a basket, then proceed to the next; when the basket is full, carry it to the place of packing, which should be under a roof; the next operation is to pack the bunches in boxes, which should be both light and strong; twelve by eighteen inches, and four or five inches deep is a convenient size. Such boxes will hold from sixteen to twenty pounds if properly packed. To do this aright will take some experience.

I would recommend that the boxes be set on a table of convenient height, having the back end of the box elevated three or four inches by placing something under it; then commence at the end next to you and lay the bunches in carefully, pressing them together gently, but not hard enough to break the berries. When the bottom of the box is covered one layer deep, commence at the front again, put in a second layer, placing the larger bunches in the low places, thus keeping them as level as possible. Proceed in this manner until the box is full, being careful to have the box as level as possible when done. Cutting bunches to fill up cavities is not a good practice, as large bunches sell best.

When the box is full set it aside and proceed to fill another, and so on until all are full. The boxes thus filled should be allowed to stand until the stems of the grapes are wilted and become pliable, which will take from six to twenty-four hours; then take a board and cover the box, placing one hand under the box and the other on the cover, then set the box on one end, holding the cover securely in its place with one hand, then shake or jostle the grapes till they settle compactly together, which is easily accomplished after the stems are wilted; this will cause a cavity at the upper end of the box, which should be carefully filled with grapes that have had their stems wilted, in order that they may pack closely.

Great care should be taken to avoid rubbing the bloom off the grapes, as it injures their appearance, and it is thought they will not keep as well. Care should be taken to hide the stems of the last layer and have the stems look level and even on the top. Grapes should not be allowed to stand in the sunshine after they are gathered. Grapes transported according to the above directions can be carried a long distance without injury."

THE COLORING AND FINISHING OF GRAPE VINES.

A CORRESPONDENT of the Farmer (Eng.), in writing of what he terms the coloring and finishing of grapes, throws out some ideas which may be useful to our vineyardists and those who grow grapes under glass:

It is of much importance to know the best means of coloring grapes. These are very simple, and may be epitomized into a rather low temperature and a moist atmosphere. Of course, low temperature must be taken in a limited sense. Grapes, for instance, during their swelling period will enjoy a temperature of from 75° to 85°. After they begin to color, 70° is a sufficient maximum. From 65° to 70° may be accepted as the best coloring temperature. Exciting treatment, the basis of which is a high temperature, generally tends to finish black grapes of a claret hue, and to make white grapes green instead of golden. It may be difficult, perhaps impossible, to explain the cause of this. But of the fact there can be no doubt whatever; experience establishes it beyond controversy. If any doubt it, let him try to finish grapes in a high temperature, and they will reap colorless or imperfect color. Perhaps the great artist, Nature, can neither mix nor apply her colors only in a rather cool medium; assuredly it is so in autumn-tide when the sun is losing power, and the nights become long and dewy, that the majority of fruits are colored; and we can hardly do better than follow the lead of Nature in the matter. Some only copy half her example, and fail. They depress temperature, but forget the dewy nights. Nay, they reverse this lesson, and keep their vineries abnormally dry during the coloring stage. Of course, anything like a saturated atmosphere is to be avoided. The grapes are too near maturity to bear any excessive amount of moisture with impunity. And some grapes are sensitive to any excess of vapor, such, for instance, as the Madresfield Court, Joslin's St. Albans, the Golden Champion, and others. But in avoiding an excessive humidity, we must beware not to run into the opposite extreme of aridity. Anything approaching this will arrest coloring, or render the process thin and imperfect.

Neither must the temperature be so low as to arrest growth, any check at this stage will interfere with the coloring of the grapes. Little growth of wood or leaves may be made; but it is needful to keep the fluids of the plants in motion. During the coloring of the fruit that motion is compound—downwards as well as upwards. Possibly the downward motion is most potential, and that color is the product rather of the descending than the ascending sap. If so, that partially explains the reason why a lower temperature is needful. Withdraw the two stimulants of heat and vitality and the law of gravitation comes into full play, and brings down the highly elaborated sap to complete or perfect the coloring of the fruit. Be that however as it may, a rather low, regular, unexciting temperature, with a moderate amount of moisture in the air, seems that best adapted to the perfect coloring of the fruit. It may be well to explain somewhat definitely what is meant by a moderate amount of moisture in the air. No one of experience would think, for instance, of syringing grapes overhead during the coloring stage. That would ruin the fine bloom of grapes by mechanical abrasion, as well as throw an excessive amount of moisture into the atmosphere. But during dry weather paths, stages and inside borders might all be damped down with advantage, say at 7 A. M. and 5 P. M. In cases, too where the stems of the vines are trained near to hot water-pipes, the stems should be kept moist during the coloring process by frequent syringing.

The greatest strain is probably on the vine throughout the coloring of the grapes. Nothing, perhaps, proves this more than that mysterious disease, shanking. No doubt this is caused at times by other causes. But another explanation is that it is a natural provision inherent in the vine to enable it at the last and most trying moment to rid itself of an excessive crop. Hence while other bunches proceed to color and swell, the shanked ones suddenly color a little and wither up or shank. No one of experience can have failed to note that over-cropping is one great source of failure in coloring. There either seems not sufficient color available for so

many berries, or the vine lacks the ability to lay it on. Thus over-cropping, quite as often as injudicious treatment, leads to red Hamburghs or green Muscats. These are not always deficient in flavor. The vines have made a supreme effort to charge the fruit fully with vinous or saccharine matter, and failed at last to color them.

The Garden.

THE GREEN PROLIFIC CUCUMBER.

In the RURAL of the 14th inst., I noticed an account of some one's experiments with the Green Prolific Cucumber, which differs so much from my own experience that I cannot but believe that the writer made a mistake in labeling his experimental rows; for even the most superficial observer could not possibly mistake a Green Prolific Cucumber for a White Spine, as you will readily perceive by comparing the accompanying specimens. Although they are damaged considerably by frost, they may yet serve the purpose. Both were grown under like conditions and exposed to the same low temperature which nearly destroyed the White Spine, while it left the Green Prolific but little injured.

Your correspondent admits that the dry season has been unfavorable to the growth of cucumbers, but he is mistaken when he supposes that he has seen the "least that can be said," for I know of instances, last summer, where the vines of the White Spine and Cluster were actually parched on the ground without producing a single cucumber. On the other hand I know of fifteen acres of Green Prolific, grown in Virginia, which gave better results to the growers, than were obtained from any other variety. Of this crop I cannot give the exact number of pickles raised, but to appease "the regrets that the exact number an acre will produce is not given," I can give an instance in which 443,529 Green Prolific Pickles were grown on two acres, another in which 125,055 were grown on half an acre, and another of 492,550 on two and one-half acres; not by "arithmetical computation," but by actual count of the cucumbers picked. One might as correctly get at the product of an acre of cabbage by multiplying the weight of one head, grown in the garden patch with the number that might be grown on an acre, as to find the yield of an acre of pickles by arithmetical computation of the product of a few hills. To ascertain the number of pickles a cucumber vine will yield, the pickles must be picked every day. When picked irregularly, or when some are left on the vines to ripen, no estimate can be formed of the probable crop, and the yields of the different varieties vary but little.

Your correspondent, endeavoring to ridicule the idea of dating the origin and improvement of a cucumber back fifty years, appears in a dilemma to know whether this improved cucumber is the result of the "unselfish perseverance and assiduity of one cucumber-struck individual." I can assure him that it is no such thing, but, on the contrary, that it is the result of the persevering selfishness of an entire cucumber-struck community, trying to obtain the most profitable cucumber for pickles. To the theoretical agriculturist a cucumber may be "a little thing" but to the practical farmer, who makes his living by raising pickles, and who derives his principal income from this crop, it is far from being "a little thing."

Growing several acres of pickles, and having several millions of pickles, annually grown by contract, I have sufficient opportunities to learn the importance of the pickle crop. It brings hundreds of thousands of dollars to the farmers of this country alone. To the pickle grower the quality and strain of seed are of paramount importance, and so it was fifty and more years ago. Neither of the kinds grown then, the Long Green and Cluster gave full satisfaction; and when some farmers found in their fields seed which gave them a larger yield and better quality of pickles, and brought more money into their pockets and which the "pickle house" took in preference to the old kinds, they did not trouble themselves to know whether it was a cross or a "derivation hybrid;" but they carefully saved and planted it as "the right kind of pickle seed." For many years it was in the hands of but few families, of whom no amount of money could have purchased it. In later years one of "the younger members of the pickle-growing family" had one-half of a field planted with White Spine and the other with "the right kind of Pickle Seed." (The latter yielding nearly double as many pickles as the White Spine.)

The more elongated form of the pickles from a few hills in the "right kind" field could not escape the grower, who considered them a great improvement on the old "right kind." This "cross" or "fixed strain," whichever it may be called, was planted separately, and continually improved by careful selection, and lately introduced under the name of "Green Prolific." Its excellence has been proved in hundreds of instances, and some of the largest pickle-factories, after using all other kinds, prefer the Green Prolific to any other variety.

Why any one should try to ridicule the introduction of a new cucumber any more than that of the Trophy Tomato or the Snowflake Potato, or that of an improved strain of cattle is not apparent; but it is certainly not the province of a journalist to run down a new thing after one careless and imperfect experiment. He might as justly belittle the speed of a race-horse after driving it before a lumber waggon on a steep mountain road. F. M. HEXAMER.

ONION CULTURE.

THE Onion appears to be one of the few exceptions to the general rule that a rotation of crops upon any given piece of land is preferable to a continous succession of one and the same plant. Experience has proved beyond a doubt that Onions may be cultivated for many successive years upon the same soil without its showing the least sign of deterioration, and so well is this known that it has almost become an adage among the cultivators of this bulb that an "old Onion patch is better than a new one." It is scarcely to be supposed that Onions, or any other plant which draws nourishment from the soil, can be of any benefit to it in the way of imparting fertility, therefore we may attribute the improved condition of land upon which Onions have been cultivated for several years to the disintegration caused by frequent plowing and hoeing in order to keep the plants free of weeds.

But leaving all theories out, we know that Onions succeed best on very rich, fine soils, and very poorly on those of a poor, tough, tenacious nature, consequently to make the crop profitable a man needs to be careful in making a selection for an Onion patch. Low land which has been artificially drained, like the bottoms contiguous to creeks and rivers, are usually well-adapted to Onion culture. We know of some quite extensive tracts within a hundred miles of New York City which are valued at one thousand dollars or more an acre simply on account of their adaptability to Onion culture, the crop being almost certain, although the seasons may be very variable. These low, peaty soils, when well drained and manured, yield enormous crops, and are not affected to any considerable extent by droughts.

Where low, moist soils cannot be obtained for Onions, high, dry soils can be made available by plowing deep and adding fertilizers in large quantities. Wherever a man can find a ready market for Onions at from fifty cents to one dollar per bushel, he can well afford to spend one to two hundred dollars an acre in the preparation of the land. Of course we do not suppose this is to be an annual expense, but as a preparatory step for a permanent plantation. Fertilizers of some kind will need to be applied every year, but the cost need be but trifling if the soil is put in first-rate condition at the start.

The fall is an excellent time—in fact, the only proper time—to prepare land to be occupied with Onions the following spring. Plowing, subsoiling, draining if necessary, and the application of any kind of coarse manure to be used, should all be done now, before cold weather sets in. If the land is now thrown up in *ridges* the frosts of winter will disintegrate the exposed particles and break down all lumps, and if coarse vegetable manures are applied the juices will permeate every portion of the surface soil before spring and be in condition to be taken up by the plants in due time.

Those who expect to raise Onions or other vegetables next season should make preparations for them this fall, at least whatever can be done to save time in spring ought not to be neglected this fall.

Field Crops.

A CORN HORSE.

I HAVE just been reading on page 188 of the RURAL NEW-YORKER H. IVE'S recommendation of the use of a corn horse in harvesting corn. Allow me to differ entirely from his opinion of its merits. I look upon a corn horse in a corn field as simply a nuisance, for these reasons: First, the use of it takes up too much time. A man can cut nearly a quarter of a shock of corn in the time needed to remove the horse from one shock to the site of another and there adjust it for use. Again, where the horse has been used, the corn will not stand up nearly as well as where it has not, for the horse always has a strong tendency to bend the shock in the direction in which it has been drawn out.

My own way of cutting corn is as follows: I take six rows of corn for one of shocks. I cut the two middle rows until I have a good armful, which I then bind firmly with a band just above the ears. Set down firmly, this will stand just as steadily as if set round a hill, and with this as a nucleus, a little care can build a shock which will stand until it rots on its site. When the central bundle has been fixed, I clear a circle round it, and then cut down four good-sized armfuls, one of which is placed on each side of the first bundle, and the whole strongly bound together at the top with a couple of bands.

For a shock Mr. IVES takes only 36 hills, which, in case of common corn, is surely not enough. Fifty-four hills are not too many for a shock, which should always husk out a bushel of corn. Shocks are often much too small, and when the corn dries a little, there is not enough for mutual support and the whole is thrown to the ground. To-day I noticed some of this kind, where the shock was only about the right size for a moderate bundle. This corn has been cut only three days, and already the shocks are rapidly inclining to a fall. Most of the folk hereabouts build their shock round a hill, though many of them readily own that this is a poor fashion, yet so hard is it to move them out of time-honored ruts that I can get only a few to adopt the plan which they acknowledge to be the best.

It is unquestionably an unmitigated humbug to be forced to stop repeatedly while husking corn, in order to cut down the standing remnants of the crop which has been nominally cut already. As for a corn horse, the use of it may amuse boys and greenhorns, but cannot be approved by men of sense. H.

Starkey, N. Y.

The Centennial.

WESTMINSTER HOTEL,
PHILADELPHIA, Oct. 25, 1876.

ALTHOUGH the Centennial Poultry Show does not open until to-morrow morning for the general public, the privileged few have been allowed within its limits on this afternoon. In extent and excellence it is of the first order. The entries number, as far as known, six thousand. The varieties comprise Asiatics—French, English and American. In this last there are some cross-bred fowls now bred up to a distinct family. Then there are Italian and Spanish poultry akin in shape, but unlike in plumage. The water fowls are very beautiful and useful as a home product. So are the pigeons, than which a better collection has rarely been seen.

As the useful is more valuable than the purely ornamental, I shall commence with the Asiatics. These fowls are the Dark and Light Brahmas, the Partridge and Buff Cochin Chinas, the Cinnamon Cochin Chinas and the White and Black varieties. All of these are excellent table fowls, good brood hens and fair layers. Though originally from the tropics, or nearly so, their sojourn under the murky skies of the British Isles, whence the American fanciers have drawn their original stock, has rendered them more robust and fitted them to the frequent changes of climate. To-day the Asiatic Poultry run about like ordinary barn-yard fowls, and grow up to great size on an equal quantity of food. The Partridge and Black Cochin please me most, both in plumage and excellence of character.

As a table bird, the French and English contend for the first place. The best French varieties are the Houdans, the La Fleche and the Crove Cours, placed in this order. The English are the Dorkings, and all of the game family, the Dominiques and their offshoot, the Plymouth Rocks. The Dorkings are considered the very best table fowls for excellence of flavor, though less in size than the Asiatics. They are good layers, but poor sitters. Nothing can surpass as hardy, self-reliant birds both the Dominiques and the Plymouth Rocks. They both are the poor housewife's chickens—thrifty, hardy and good feeders. The White Leghorns are a neat, well-set-up race, so like in form and habits to the Black Spanish, that I would fain believe them to be first cousins. Both varieties are, when young, good layers, but forsake that habit as they advance in years; neither are they careful mothers.

Of the three French varieties the Houdans have most admirers as putting up more flesh on a given quantity of keep than either the La Hoche or Creve-Cours. All three are domestic in their habits, and though allowed to range, never go far from home. Among the exhibitors most certain to please good judges will be George Warner, Esq., of New York Mills, Oneida Co., N. Y. He exhibits several Seabright, or gold-penciled Bantams, as pretty and as tiny as their owner could desire; but to pass from the purely ornamental to the useful, the same exhibitor shows Houdans, and English Dorkings, both good—the last the best.

Among the water fowls, Mr. Todd, of Vermillion, Ohio, shows some superb specimens. One pair of his Toulouse geese, huge beauties, stand on the scale fifty pounds in weight. These dark-brown birds are good mothers, and excellent as meat. The Camden Goose is handsome, and when high-bred and in full plumage, can, on the water, compare with the Swan. Mr. Todd shows both the Aylsbury and the Rouen Duck. The Aylesbury, under his economy, preserve, in despite of emigration, the delicate pink tint of the bill, for which they are noted in England, and which fades out so frequently, even in imported individuals, the first generation rarely possessing this distinctive beauty. As layers, both the snowy English and the dark, glossy, French Ducks are equally good. Their flesh, too, is of equal excellence, the choice between them being a matter of taste in plumage. The Rouens attain a slightly greater weight. Both are moderate feeders and very thrifty.

The Egyptian Goose is just now attracting much attention among fanciers. This bird is, for a goose, of small size. In plumage it resembles the Mandarin Duck more than any other water-fowl well-known to Americans. As an article of food valuable in commerce the Egyptian Goose will not stand high; but as an ornamental creature on ponds and small inland lakes, the family is likely to become a favorite. Probably with a careful study of their habits and needs, they could be bred true to feather, and live out, as Swans do, under thatch, in sedgy borders. The Black Cayuga Duck is a lovely, neat, close-built water-fowl. After much careful selection, they are now purely black. One white feather will cause the loss of a first prize. These black beauties are easily kept and are good on the table.

That America is the home of the Turkey is manifest, her Bronze Turkeys being kings among their fellows. Several pairs are on exhibition—all good and some excellent. The White Turkeys are cold and poor-looking beside those of a bronze color, nor are they in any respect so valuable, being delicate and small. The Pied Turkeys, Brown and White, are very handsome, but still I prefer the Bronze variety to all others.

The collection of Pigeons is immense. The numbers outnumber expectation, and then the specimens are the choicest. The African Owls, with bills so small as barely to be bills, have been procured from the Columbaria of Her Highness the Princess Albrecht of Berlin, Prussia; then there are Swallows Black-and-White, also Red-and-white, puny, odd-looking little fellows, with their toes feathered to the ground; Jacobins with ruffs as formal as those of the days of the Virgin Queen; White Fantails, and those gentle messengers, the Carrier Pigeons, under whose glossy wings many a sad tale has been conveyed when death and havoc reigned supreme and where war's wild sorrows covered the land.

Of purely fancy birds the exhibit is, as yet, small, only a few specimens being shown—a brace of Golden Pheasants from far-off China and a trio of Silver birds close by. As a table delicacy, the flesh of the native English Pheasant is so good as to be numbered among royal dishes. As yet none of these are exhibited, but as soon as the British entries of poultry come to hand, doubtless some will be among them. These poultry are still tossing on the Atlantic, their steamer being over-due. Much anxiety is expressed for their arrival, as, if they are really valuable, few, if any, need return. England ought to be able to send over Game and other native breeds of such excellence as to insure a ready sale.

The arrangements of the Bureau of Agriculture are all that could be needed to secure comfort and safety to the feathered competitors. These occupy the Pomological Hall—a sort of annex to the Agricultural Hall, and possessing the advantage of being within the limits of the Centennial Grounds. Darkness comes on apace and visitors are departing, so I must conclude.

M. M.

CENTURY BLOSSOMS.

THE United States Centennial Commissioners announce the following Report as the basis of an award to HRESNER & SONS, Lansdale, Pa., for their Patent Level-Tread Railway Horse-Power:—"For level position secured to plank upon which horse steps, dispensing with expense of sharp shoe-calks and continual wear of plank, and for security obtained to man and horse by means of governor placed on shaft inside of belt-wheel, acting independent of brake, and for cheapness and durability." The above Report is officially signed by J. R. HAWLEY, President; A. T. GOSHORN, Director-General; and J. L. CAMPBELL, Secretary.

THE representatives of the European nations are as peaceful and lamb-like as if no war was about to begin across the Atlantic. Even the Turk looks as if he did not apprehend any difficulty in meeting the interest on his debt.

THE majority of distinguished visitors at present wandering over the grounds are newspaper men in search of advertising. Business was never so brisk.

THE price of bronze has fallen since the Centennial Commission are no longer in the market.

Floricultural.

MISCELLANEA.

EXTRACTS FROM CORRESPONDENTS LETTERS.

J. M., Houston, Texas.—It is with a certain reluctance that I avail myself of your liberal offer in the Rural to distribute certain seeds among subscribers who send for them. If you had set a price, I would willingly have paid for them.

In a former issue of the Rural, you ask the opinion of your subscribers as to the changing of the color of Hydrangeas. Here is mine: Seven years ago I planted a Hydrangea on the north side of my house. To-day it is a bush seven feet high, six across, and covered every summer with hundreds of blossoms. The first four years the flowers were rose-colored. The fifth year, to my great surprise, the flowers were a clear sky-blue—a color which they still assume. Now, my theory about this change is this: My soil is a moldy sand, ten or 12 inches deep, underlain by a yellow-reddish clay. As long as the roots of the bush drew their sustenance from the surface soil, the blossoms remained pinkish. When the bush grew older and pushed its roots into the red subsoil, the flowers changed to blue. If I raise cuttings from this bush, they bloom pink again. [This change of color has usually been observed when the plants have been removed from one situation to another, in the soil of which iron was supposed to abound. In the above instance, the roots penetrated an iron subsoil, producing the same effect.—Ed.]

If I were a better hand at writing, I would like to communicate something of my experience in raising fruits and flowers here in Texas. I should write you about budding Walnuts (not grafting), which seems to be a lost art, and which I practiced successfully when I was a small boy, about twenty years ago, in my father's nursery in Switzerland. This is effected by a little deviation of the time and method practiced in budding fruit trees. I should also write as to some facts which I have observed, viz., that, in grafting, the stock has a marked influence on the fruit of the cion, notwithstanding the denial of many horticulturists. I would say to Mr. Miner that I have his "supposed" Grape vines, Nos. 1 and 2, *in natura*, not ten yards apart, same variety, and both seven years old—one, never touched with a knife, given the free range of a big Oak; the other kept regularly pruned, summer pruned, pinched and trained on a small trellis four feet square. The comparison of the result has left me a close prunist.

With this I take occasion to send you a few seeds of a very pretty Texas flower, rather rare, called here Prairie-tulip. With my limited botanical knowledge, I trace it to the genus *Gentiana*, but cannot find the species described. It is a perennial, has a rich, dark-blue flower, quite substantial and lasting, about three inches in diameter. It blooms through the summer months, inclining to sport to white when cultivated. It is preferable to many an exotic and in every way worthy a place in the flower garden. I hope you will deem it worth a trial in the Rural grounds. [We certainly shall.—Ed.]

A Contrast.—Look on this and then on that:

——, Conn.

Dear Sir: On returning from a visit, I read your "Little Announcement" in Rural of 7th inst., and hasten to avail myself of the offer it contains.

The name of my husband [—— ——] is no doubt on your books, and that it may find a place there so long as the good paper continues a printed sheet is the wish of yours, etc., ——.

You may send seeds of Snapdragon and Green Gage Tomato.

——, N. Y.

F. E., Rural New-Yorker: I will take seeds of Double Hollyhock and Pelargonium as per your offer Oct. 7. Yours, ——.

True, the second is more business-like and concise than the first. But though in one sense this is a matter of business, in others it is not, and we confess to a leaning toward those kindly letters that prefer the latter view. We may say, however, that where we receive one of "that," we receive fifty of "this."

To The "Rural" Floriculturists.—We wish that all our floricultural friends would write us of the plants that through this summer have pleased them most;—of the single plants, of the bedding plants, of the vines, shrubs, and of the trees, too. Arbitrary distinctions are made between trees and more lowly-growing things which are called plants or shrubs. There is in fact no place to draw a line. All plants have flowers and fruits, and the Apple tree or Horsechestnut is just as much a "flower" as the Pelargonium or Hyacinth. Write us, then, all of you who love flowers well enough to have worked among them the past season and to have observed what seemed to you most worthy of your time and labors. Tell us what you have learnt in the culture of flowers; what mistakes you will avoid, what new ideas you will attempt to carry out another year. Perhaps you do not care to reveal your plans for another year. Then you are not true lovers of flowers. *They* have no secrets. They cannot hasten fast enough to make known whatever they have discovered that would gratify a friend as much, perhaps, as it gratified them. The taste for floral occupations knows no miserable partisanship. It is gregarious and benevolent, seeking kindred spirits, as "birds of a feather flock together," and while a commendable emulation inspires one to eclipse a neighbor or a friend, he will assist him in every way, and be happy rather in rendering his rival formidable than in depriving him of any means of attaining superior results. Such victories are as "Roses without thorns." The victor and the vanquished are both pleased; the latter that he has done so much, the former that he has done yet more. If flowers work a tithe of the good with which they are credited, those who are possessed of original information and make a secret of it are not unlike a minister who, having devised a new method of doing good, confines its operation to the members of his own family.

Communications from our friends are always read with all due attention. We are happy to hear from them on all matters appertaining to floriculture, whether with or without a view to publication.

Spiræa Prunifolia.—We have been trying to think, for a week or so past, to call our readers' attention to the foliage of *Spiræa prunifolia*. It is not too late. The glossiness which characterizes its leaves while they are green still continues now they are red, having changed from green to their present color through several distinct and pleasing shades. As we have noticed the fall tints of many trees and shrubs of the woods, fields and gardens about us, there is not one other, it seems to us, that changes so beautifully, so brightly, and yet holds its foliage so persistently. Now, indeed (Oct. 20), most of the leaves of other plants have fallen, while for the most part those that remain have faded to the color of fallen rather than of Fall leaves. In a garden 500 feet away, we see among the shrubs only this, so striking is its foliage among the half-leafless branches of those about it. The beauties of Autumn Leaves have been well sung, though not, possibly, over-sung. But while the Oak, Maple, Liquidamber, Tulip, Sumach, etc., have constituted the subjects of those songs, *S. prunifolia* we have never seen mentioned, though, unless this season has been one to cause an exceptional deposition of erythrophyllline (whatever that is), it is as an Autumn plant the brightest and most enduring of them all. This shrub possesses several rare claims upon our regards, to which we have referred in other numbers. We should select it as one of the very few that may be seen in every garden without being considered too common to be worthy of a dignified position.

Garden Paths.—The Rural New-Yorker recommends walks about the premises in winter to be made of coal-ashes, sand and clay. Now, what does any one want better than coal-ashes itself? We have used it for at least a quarter of a century, and nothing could answer better. Put the coarse particles at the bottom and then cover with the other to the depth of about two inches, and you will find a walk always dry in five minutes after a rain when there is no frost. There is nothing to stick to the shoes, and very few weeds interfere. Once a year a thinner dressing of the ashes should be applied and well rolled, and this is all the trouble. Keep away all sand, and especially *clay*, with which no good walk can be made in winter.—*Germantown Telegraph.*

However easy it may be for city people or for suburban people to procure coal-ashes, it is not so easy to procure them in the country, in sufficient quantities at least to form paths of any extent. But supposing they are readily obtainable, we yet prefer a mixture of sand and clay, as above stated, the latter to be used in a very small proportion. Coal-ashes alone are objectionable for two reasons: The surface becomes powdery and is blown over the premises in clouds of dust, and their appearance is far from orderly or neat. We have found that coal-ashes mixed with sand and a little clay after awhile become as hard as cement and do not readily pulverize, as is the case with ashes alone. At a first glance, the advocacy of any material for paths into which *clay* enters seems absurd. We have tried both plans, however, and deem the ashes, sand and clay, all things considered, as preferable to the other.

EXCHANGE.

Sept. 29, 1876.

Many thanks to you for being so kind as to allow us flower lovers a space in your paper. Some who put in an Exchange notice tell what they have, but do not say what they would like to receive. [We had not observed this.] I have some Striped Grass, Sweet Peas (also a Climbing Pea), some blue Canterbury Bells and Pewplant seeds, which I will send to any one who will send me a few white Canterbury Bell seeds and Double Wall-flowers. Address Mrs. E. C. Ross, *Waitsburg, Walla Walla Co., Wash. Ter.*

Please publish the following under your Flower Seed Exchange:

Wanted to exchange seeds of *Ageratum Mexicanum* — Pansy, mixed varieties — *Portulaca*, mixed colors, and Vick's Japan Cockscomb, for a few Potato seed balls, two or three varieties preferred.—Clinton Higley, *Windham, Portage Co., Ohio.*

Scientific and Useful.

EDIBLE AND POISONOUS MUSHROOMS.

During the past few weeks several cases of mushroom poisoning have been reported in the vicinity of New York, but it would be difficult to determine with any degree of certainty whether the persons named were really injured by the mushrooms or something else. Still it is well known that there are poisonous species of fungi, but they are not half so common, or so likely to be gathered for eating, as one might suppose from the reports of mushroom poisoning which get into the papers, through the desire of a certain class of writers to start a sensational paragraph, whether there is any truth in it or not.

We have a number of both poisonous and edible fungi which are also found in Europe, and a late writer in the London Garden in speaking of mushroom poisoning gives us some facts which are equally as applicable here as in England, and we publish a portion of them for the benefit of the readers of the Rural New Yorker. With autumn comes the great mass of Mushrooms and Toadstools—good, bad, and indifferent, and of all colors, shapes, and sizes. For some considerable time past, attempts have been made to introduce and popularize Continental Fungus-eating customs; but, up to the present, these attempts have not been crowned with any special degree of success. We learn from Dr. Badham, that in Rome the common mushroom is classed with poisonous Fungi, and not allowed to be sold in the public market. It is highly improbable this would have been the case without some good and substantial reason for it, for Italy is a country where numerous species of Fungi are largely consumed, and no fear of these plants as a class exists. It would seem as if there were something special in the climate of the districts from which the Roman market is supplied that renders the Mushrooms grown in it poisonous. We know how powerful is the influence of surrounding circumstances upon flowering plants. For example, the exclusion of light from Potato tubers or Celery plants considerably modifies their properties. Every now and then we hear of people being poisoned (not necessarily fatally) in this country by eating Mushrooms, and when this happens, it is almost always attributed to the wrong kind having been gathered, and not to the nature of the plant being modified by special circumstances. Upon more than one occasion such cases have come under my notice personally, in which people, who knew what was a Mushroom and what was not, have been made seriously ill by their repast. What the precise difference in the composition of the plant is which causes the unpleasant effects, is at present unknown, and is one of those points which have to be worked out. As a rule, however, the wholesomeness of the Mushroom is well-nigh cosmopolitan. Several years ago the late Mr. Thomas Baines, who had traveled much in Australia and Africa, told me Mushrooms were always eaten when found in his expeditions. Popular credence points to the unwholesomeness of those specimens grown under trees or in woods, but this is in no way substantiated by my experience. The possibility of distinguishing an edible from a poisonous Fungus by bruising with a piece of gold or silver, has been repeated time after time in all kinds of books, and many an excellent mushroom has been rejected by the credulous housewife because, when rubbed with salt and a silver spoon, it has turned yellow! The vast majority of Mushrooms grown in my district, upon the salt marshes and elsewhere, turn most distinctly yellow when cut or bruised; but this is simply because they are specimens of the Horse Mushroom (Agaricus arvensis), and not of *A. campestris*. Berkeley, in "English Flora," says that *A. arvensis* may be known from *A. campestris* by its almost white gills when young, and yellow stains when bruised. Most British fungologists regard this change of color as one of its specific characteristics; and thus it is really a proof of the wholesomeness of the Fungus. I do not remember, indeed, any Fungus which changes color in at all a similar manner; in fact, excepting one or two of the Lactarii, this particular change is a very uncommon one. *Agaricus arvensis*, the so-called Horse Mushroom, is by far the most generally eaten Fungus in this country; it occurs far more commonly, is much more abundant, and attains a considerably larger size than *A. campestris*, the so-called true Mushroom. They are equally good in flavor, and equally wholesome.

In several books certain general rules are given for ascertaining at once whether a Fungus may be eaten or not; they are so absurd, however, that those who know better never think of refuting them. It is not exactly easy to see whether these rules are intended for the discrimination of the Mushroom from other Fungi, or edible from poisonous species generally. Perhaps the most important of these canons is that edible species never change color when cut or bruised. We have seen how *A. arvensis* comports itself under such conditions. But there is a variety of *A. campestris* (*rubescens*, *Berk.*) which becomes brilliantly pink at the seat of injury; and this plant is one of the most savory forms of the Mushroom with which we are acquainted. *A. rubescens* assumes, as its name implies, a reddish tint, especially where it has been injured by insects. *Lactarus deliciosus* turns from bright orange to a dirty green, and this alone is sufficient to distinguish it from all its compeers. The mere fact of a Fungus changing to blue cannot be regarded as an absolute proof of its toxic qualities, for a friend of mine has eaten *Boletus chrysenteron* before he knew accurately *B. edulis*, and during my noviciate I several times partook of *B. bardus* without any ill effects whatever accruing. Another rule very commonly relied on is that if a Fungus be pleasant to the taste, and its odor not offensive, it may be eaten; but this is not only a fallacious, but an exceedingly dangerous guide. It is quite true some Fungi are intensely acrid, and are irritant poisons, but upon the other hand *Lactarus deliciosus*, one of the very best of our British species, as its name implies, when eaten raw causes a very unpleasant amount of tingling of the mouth and tongue. Far more important, however, is it to remember that a Fungus may have a pleasant odor and taste, and yet be most virulently poisonous. Mr. W. G. Smith was poisoned by eating less than ½ oz. of *A. fertilis*, which has anything but a disagreeable taste. Again *A. muscarius* has no acridity, neither has *A. phalloides* or *A. Mappa*: and whatever may be the character of the two latter, the poisonous properties of the former are well-known. It must be remembered that Fungi may be irritant, narcotic, or narcotic-irritant poisons, and while it is possible to recognize an irritant by the taste, a narcotic may be nearly tasteless.

There is one way, and only one, by which, according to Mr. Blowright in "Science Gossip," edible Fungi can be discriminated from poisonous ones with absolute certainty, and that is, by a knowledge of the individual species. As well might a code of rules be laid down for the discrimination of wholesome from poisonous fruits or vegetables as for Fungi. People do occasionally mistake Aconite roots for Horseradish, or Fool's-parsley for Parsley properly so called, but we have no general rules drawn up in this case, neither do people become panic-stricken and eschew the whole race of condiments because of these unfortunate accidents. But if any misadventure occurs from eating Fungi, the whole race are scouted and branded as the harbingers of death. In this country Fungus-eating is reserved for the few, but it by no means follows that these few are experimentalists: far from it, for the species they eat have been known to be edible, and have been eaten by the initiated from time immemorial in other lands if not in this. Like other kinds of food, they vary much in flavor, in the facility with which they can be digested, and in their nutritious qualities. Certain excellent species cannot be too widely known, and every housewife should be able to discern them, especially as they have all well-marked characters.

Occasionally we hear vegetarians say they live upon some fabulously small sum—a few pence per diem; and although very few people indeed would care to debar themselves of wholesome, nutritious food for the sake of a mere theory, yet it cannot be overlooked that the continued and continuing increase of the population will eventually demand a full development of the resources of the country. There cannot be a doubt that the esculent species of Fungi will in the future occupy a most important place in the dietary of the nation, not simply because of their cheapness, but rather by reason of their nutritions qualities and the large proportion of nitrogenous compounds which they contain.

ADULTERATING OILS.

"There is cheating in all trades but ours" is an old saying, yet it would be difficult in these days to find a case where even this exception could be applied with any degree of truthfulness. The greatest amount of cheating is done in those articles where it is likely to be detected, and as an instance of how we are swindled we make a few extracts from an article in the Chemist and Druggist on the adulteration of oils, taken from

a report presented to the American Pharmaceutical Association.

The man who may pride himself on his pure Holland Gin is informed that the oil of Juniper Berries was offered to the writer by a highly respectable firm of wholesale liquor dealers, who, in their desire to have a really pure and superior article, had themselves imported it direct from Holland, having ordered the very best that was obtainable. As a very much greater quantity had been sent than their order called for, they were anxious to dispose of a portion of it. The gentlemen were so very sure about the absolute purity of their oil, for which they had paid a very liberal price, that they were loth to believe their own eyes when, after agitation with an equal quantity of water, only 20 per cent. of their so-called oil was left, the remainder being alcohol.

Oil of Lemon, put up in original cans and genuine imported cases, branded "E. B. & Co.," was found by the writer to contain 25 per cent. alcohol, and 40 per cent. castor oil. Another lot, branded "W. S. & Co.," contained 25 per cent. alcohol. There is every probability that both seals were counterfeit, as the letters composing them were slightly different from those found on the top of genuine cans from Brehmer and Sanderson. The metal on which the seals had been impressed also presented a dull and tarnished appearance, while it is usually perfectly bright and clean.

If the baby wants a few peppermint drops, the chances are that he gets something else instead, for the committee tell us that oil of Peppermint was met with also largely reduced with castor oil and alcohol. Twenty-six pounds of this adulterated oil yielded, when distilled by the writer, 8½ pounds of pure oil, about a gallon of castor oil remaining in the still. The proportion of alcohol, which had been present, is represented in the loss.

Oil of Rose Geranium is now so frequently substituted by the ginger-grass or palma rosa oil, obtained from *Andropogon Schœnanthus*, that it is somewhat difficult to procure the true oil of *Perlargonium odoratissimum* or *Radula* in commerce.

Oil of Wintergreen was offered to the writer by a tall Jerseyman, who professed to have distilled every drop of it himself, and who therefore claimed to be able to guarantee its absolute purity, which proved to contain just two-thirds of its volume of alcohol. It is somewhat remarkable that even this large proportion of alcohol could scarcely be recognized by the senses, and that, as far as could be judged by the taste and smell, this was an unusually fine specimen of oil of wintergreen. Several other lots have been met with containing various proportions of oil of sassafras.

Those who pride themselves on pure salad oils are informed that Olive Oil is largely substituted by some of the cheaper fixed oils found in this market. Very little of that which is sold by grocers is even imported from Europe. A New York merchant, who is extensively engaged in bottling this article in imitation of the imported style, informed us that for the cheapest grade he is in the habit of putting up refined cottonseed oil, and for a somewhat better brand the oil of benne. The expressed oil of mustard, a by-product in the manufacture of table mustard, is also applied to the same purpose. Our French friend, whom we have before alluded to, also kindly informed us that in this country the groundnut oil (*Arachis hypogœa*) is used to an enormous extent for admixture with olive oil, so that but very little of the latter is imported strictly pure.

Californians say that they can furnish us with all the pure olive oil required for consumption in this country, but that Eastern people prefer to use the imported adulterated article to the pure home made, and we presume they are not far wrong in making this statement.

Domestic Economy.

BREAD MAKING.

I HEARD a man say, not long ago, that making good bread runs in families. People may easily think so when they see the heavy, unwholesome stuff, which some housekeepers habitually produce, which it is a slander to call bread. I give my way of making the genuine article:—At night take luke-warm water, according to the quantity of bread required, and stir in flour till it is about right for pancakes, then stir in a teacup of lively yeast, cover it and set in a moderately warm place, to rise. In the morning it will be light. Then mix up hard, kneading it well. Return the bread to the pan and let it rise, when light, mold it down, repeating this three times. Then make into loaves and, when sufficiently light, bake carefully. Good dough may be spoiled in the oven, by too hot or too slack a fire. The molding-down process may seem like too much trouble, but it is not in practice. The addition of some warm milk, when the bread is mixed up hard, makes the bread whiter and more tender, but it also dries up sooner. The season makes some difference about the trouble of making bread, as in winter it is harder to keep the sponge of the right temperature. One of the best bread-makers I know, uses a small tin pail to mix her sponge in and then hangs the pail from a wire over the stove, which keeps it warm and makes the rising speedy. In very cold weather it is best to mix sponge in the morning, unless one has a house that keeps moderately warm through the night.

FARMER'S WIFE.

ORIGINAL RECIPES.

Piccalilli.—In answer to request of "Young Housekeeper," I send the following recipe: For one gallon of sliced, green tomatoes, (salted and drained) take one quart of cider vinegar, one pound of sugar, one tablespoonful each of mustard, cloves, and sweet fennel seed. Place all in a porcelain kettle over a fire, until the tomatoes are cooked tender; then drain them out, and boil the sirup down till just enough remains to cover them, they do not need sealing. Onions may be added if liked.—Mc.

To "Farmer's Wife."—Lemon Pie Without Eggs.—Roll or bruise two lemons until the juice will squeeze from them. Then strip off the rind and shred the remainder of the lemons, casting out the seeds. Grate one-half the rind of one lemon and mix with one cup of sugar and one of molasses. Beat three tablespoonfuls of flour and one of melted butter into the mixture, and bake as custards. Light bread crumbs may be added instead of flour.—Mc.

Aunt Susannah's Molasses Pie.—Cover a plate with paste as for pumpkin pie: spread over this crust three tablespoonfuls of flour, and a spoonful of butter cut in small pieces and five tablespoonfuls of Orleans or maple sirup. The latter is the best. Bake in a moderately heated oven. When nearly done, stir till the ingredients are well mixed, then let it finish baking.—M. E. A.

English Pudding.—One cup of chopped suet, one cup of chopped raisins, one cup of molasses, one cup of sweet milk, five cups of flour, one teaspoonful of soda. Steam three hours.

Sauce for Dressing.—Two eggs, ½ cup of sugar, butter the size of an egg, 4 tablespoonfuls of boiling water. Flavor with wine or brandy.

Delicate Cake.—Two cups white sugar, ½ of butter, one of sweet milk, three of flour, whites of 4 eggs, one teaspoonful of cream tartar, ½ of soda. This is splendid.

White Sponge.—One cup of white sugar, one of sweet milk, two eggs, butter the size of an egg, one teaspoonful of soda, two of cream tartar. Mix not very stiff.—M. J. S. *So. Jefferson.*

Hygienic Information.

"INVALID."

As you seem not to reply to Mrs. INVALID'S inquiry "as to the healthfulness of various kinds of food," and as she seems to prefer "an exclusively vegetable diet," and disagrees with me about the healthfulness of pork, it seems to me proper that she should have at least a reply as a matter of courtesy.

As to an *answer* to the question "what kinds of food are the most healthy for her," neither you nor I are as capable of giving a correct one, as she is herself. Theory and the experience of others if followed, will less often give satisfaction than disappointment, especially if the lady's disease or invalidity is that very fashionable one, dyspepsia, which I presume is the case, as she seems to look to diet for relief. The remedies for that complaint, or the maladies that are called by that name, may be reckoned by the thousand, and people who get well of them do so as often after they stop doctoring as before.

Mrs. INVALID certainly has high authority for the idea of "an exclusively vegetable diet," but I think the biography of the most noted vegetarians shows they have not generally been long-lived; they certainly have not been, as far as my observation extends, unless they have changed to a more generous diet, as was the case with a particular friend, who would not believe me when I said to him "you will eventually have to give up your exclusively vegetable and milk diet," but he did so, and ate his beef and drank his ale, and died I think at about 80. But the case was different with a family consisting of a father, mother, one son and seven daughters. The family were "well to do" well educated and great readers, but unfortunately for the daughters, they adopted the Graham system of vegetable diet, and all but the youngest died before the system was as fully investigated and tested as it is at this time. The father and son ate like other folks, and the youngest daughter was but an infant when the last of her sisters died. The father lived to a good old age and the son and youngest daughter are alive and aged now about 55 and 35 respectively.

Now I would not say that "an exclusively vegetable diet" was the sole cause of this mortality, or that this system was strictly adhered to through their whole lives, but I know that the two oldest daughters held to and practiced that system and that they had at least a partial supervision over the younger ones. I also know that they could have inherited no taint from their parents or grand parents, and the father expressed to me his belief after their deaths, that they died from erroneous dietetic habits, as taught not only in their books but by their family physician, who also died before the prime of life. If I recollect aright, it has been said of Graham that he eventually died a martyr to his principles.

I am neither a zoologist nor much of a dabbler in natural history, but I understand that by the teeth alone the natural food of any animal can be determined, and that the teeth of man indicate a mixed diet and that he is therefore classed as omnivorous. Now, Mrs. INVALID, I live with another Mrs. INVALID, whose food is beef, bread and butter, with sometimes a little potato, seldom any other vegetable or any fruit; such is her experience as to the healthfulness of food for her, and should you ask her advice she would tell you to judge for yourself, that your own experience would be your best guide.

The tables drawn up by DR. BEAUMONT as the result of his experiments upon Alexis St. Martin are very interesting in a scientific point of view, but I think they have led many into an erroneous opinion that the food most quickly digested is the most healthy for invalids. If this were true soured tripe and pigs' feet would be the most healthy for them.

I think that Graham (who certainly had some well-fortified ideas) held that the teeth and digestive organs were weakened by the lack of proper exercise; by taking food in a too concentrated form; that the stomach being muscular required like the other muscles vigorous use to keep up its full power. I know it is claimed by most writers on the subject that the stomach needs rest, and that food should not be taken oftener than three times per day, but there comes lately from some M. D. "advice to dyspeptics" to eat little and often, and were I a dyspeptic, I should try it, for this is precisely the advice generally given to those whose stomachs have been weakened by famine.

S. B. PECK.

WEARING FLANNEL.

PUT it on at once, the first week of November, a good, substantial, old-fashioned, home-made, loose, red woolen flannel shirt, and do not lay it aside for a thinner article, at least until the first day of May, even in the latitude of New Orleans. We advise the red, because it does not full up, thicken, and become leathery by wearing.

Wear it only in the day-time, unless you are very much of an invalid: then change it for a similar one to sleep in—letting the two hang alternately on a chair to dry in a warm dry room.

If leaving it off at night gives you a cold, never mind that; persevere until you take no more cold by the omission. No one ceases to wear shoes because they caused corns: it is the proper use of things which makes them innocuous. The less you wear at night, the more good will your clothing do you in the day-time. Those who wear a great deal of clothing at night, must wear that much more in the day, or they will feel chilly all the time; and our own observation teaches us, that the people who muffle up most are the readiest to complain of taking cold.

But why wear flannel next the skin, in preference to silk or cotton?

Because it is warmer; it conveys heat away from the body less rapidly; does it so slowly, that it is called a non-conductor; it feels less cold when we touch it to the skin than silk or cotton.

If the three are wetted, the flannel feels less cold at the first touch, and gets warm sooner than silk or cotton, and does not cling to the skin when damp, as much as they do. We know what a shock of coldness is imparted to the skin when, after exercise and perspiration, an Irish-linen shirt worn next the skin is brought in contact, by a change of position, with a part of the skin which it did not touch a moment before—often sending a shivering chill through the whole system.

A good deal has been said and written about silk being best on account of its electrical agencies; but all that is guess-work. We are mere blind leaders of the blind when we talk about that subtle agent; and until we know more of it, it is the greater wisdom to be guided by our sensations.

Another reason why woolen flannel is better is, that while cotton and silk absorb the perspiration, and are equally saturated with it, a woolen garment conveys the moisture to its outside, where the microscope, or a very good eye will see the water standing in innumerable drops. This is shown any hour, by covering a profusely sweating horse with a blanket, and letting him stand. In a short time, the hair and inner surface of the blanket will be dry, while the moisture will be felt on the outside. If we would be wise, we must use our senses, and observe for ourselves.

Some persons prefer white flannel, which may be prevented from fulling up, if first washed in pretty warm soap suds, then rinsed in one water as hot as can well be borne by the hand. After being once made, a white woolen flannel shirt should never be put in cold water, but always washed as above, not by putting soap on it, but by washing it in soapsuds, not very hot.

DR. HALL.

HEADACHE FROM EYE-STRAIN.

DR. WEIR MITCHELL, in the American Journal of the Medical Sciences, observes that few but opthalmic surgeons are aware of the need of interrogating the eye for answers to some of the hard questions which are put to us by certain head symptoms; and he wishes to impress upon the profession: (1.) That there are many headaches which are due indirectly to disorders of the refractive or accommodative apparatus of the eyes. (2.) That in these instances the brain symptom is often the most, and sometimes the sole, prominent symptom of the eye trouble, so that while there may be no pain or sense of fatigue in the eye, the strain with which it is used may be interpreted solely by occipital or frontal headache. (3.) That the long continuance of eye trouble may be the unsuspected source of insomnia, vertigo, nausea, and general failure of health. (4.) That in many cases the eye trouble becomes suddenly mischievous, owing to some failure of the general health, or to increased sensitiveness of the brain from moral or mental causes. Several illustrative cases are given, and the moral is: Be careful not to strain your eyes.

Insurance Department.

TONTINE ENDOWMENT PLANS.

SEVERAL years ago some of the leading life companies introduced plans to retain policy holders' shares of surplus for a term of years. The purpose was to equalize, as far as practicable, the burden of payment by giving the dividends to those who had contributed most to create them. The Tontine principle involved in all this is not, when properly understood, a bad one. The objection lies in the abuse of its application. Since that time, and especially within the last five years, many companies have adopted somewhat similar plans in order to conceal their inability to pay any dividends whatever. These devices are called by all sorts of attractive names, but are alike in certain particulars. They call for whole life rates, ten-payment or twenty-payment life rates, or any other rates, the larger the better for the company, and promise to pay "the full value of the policy and all accumulated profits" at the end of so many years, provided the policy is then surrendered. The agent ingeniously represents that "the full value" is the total premiums paid and that "the accumulated profits" will amount to a large endowment—that is, that the premium payer will get back all his money and a great deal more besides. The truth is that the policy is nothing more than mere *term insurance*, for which the victimized party pays two or three times as much as is necessary. At the end of, say, ten years it expires, and the company pays, if it can, the legal reserve and perhaps a few dollars over. For example, a man thirty-two years old pays for such an insurance $24.5 a year for what is represented to be an endowment "estimated to equal the face of the policy," one thousand dollars. At the end of ten years he claims his dues and is paid, if the company can pay anything, the legal value, $99.18. That is all he can compel them to pay and all he has a right to expect. He has paid out in principal and interest quite $336, or $238.82 more than he gets back, and has only ten years of term insurance to show for the outlay. This term insurance is worth only $13.15, or in principal and interest for ten years, $183.70. He is, therefore, out of pocket something more than fifty-five dollars, which are fifty-five reasons why the company invented the plan. The best rule in all cases, when a man proposes to sell a dollar's worth for fifty cents, is to let the man and the plan very severely alone and "thank Heaven you are rid of a knave."

PRESERVATION OF THE TEETH.—From infancy to old age there is nothing better for the teeth than water. If a tooth-brush be used nights and mornings without exception, all powders and teeth preparations will be found needless.

PAY AS YOU GO.

IT is reported that JOHN RANDOLPH once astonished Congress by springing from his seat, bending forward his long, lean body, extending his attenuated fingers and speaking in his thin, high tones, "Mr. Speaker—Mr. Speaker, I have found the Philosopher's Stone. It is—*Pay as you go.*"

Now few and small as these words are, they are worthy of the careful attention of all, and any young man by heeding them will find, if they do not turn everything into gold, they will help him materially in his efforts to secure a sufficient amount of that coveted commodity to raise him above want. He who pays as he goes may be sure of one thing—he will never live beyond his income and will, at least, be saved the mortification of duns and, what is worse, the consciousness of using the means of another for his own benefit or pleasure.

There are none who should reflect on these words and put them in practice in their daily lives, more than young people newly-married, who are together commencing a new life and who should, in the beginning, look forward to future years and in the light of reason and judgment and of the experience of others, determine on such a course of action as will most contribute to the happiness, not only of themselves, but of those also with whom they may be connected; and among the first rules to be adopted and religiously adhered to should be one to avoid incurring pecuniary obligations for things not absolutely necessary—"Pay as you go." One who has a stated salary will have no difficulty, if he has the disposition, in so adjusting his expenditures that he will always have the money on hand to pay for all purchases when made; and he whose income is from farming, trading or other uncertain sources, should never discount his expectations. Better go without desired articles, at however great an inconvenience, than buy them to be paid for with money not yet earned or realized. Wear the old coat or the old dress another season, if necessary, rather than run in debt for new ones. The old ones are yours; the new ones unpaid for will really belong to the seller, no matter what legal color the transfer may take.

There is nothing more disappointing than store bills that are allowed to run on from month to month. At the first glance at the sum total you will be certain that there is some mistake. If it be not in the addition, it must certainly be that an error in charging the items has occurred. It cannot be possible that the few articles ordered from time to time amount to such a sum. But a careful scrutiny of the whole, line by line, will doubtless prove that you have not kept in mind the fact that two and two make four. Very probably the amount is more than the same articles would have cost had they been paid for when ordered, for cash always buys cheaper than credit. This would, in a year's time, make considerable difference, and beside, the account undoubtedly shows many purchases that would not have been made had the money been required on delivery.

Much as we abhor the credit system and much as we desire to impress the "Pay as you go" idea on the minds of all our readers, we would not say it is unadvisable to go in debt at any time or under any possible circumstances. On the contrary, there are hundreds of young men who will read this to whom we would say, instead of working all your life as a farm hand, use the utmost economy, and as soon as you are able to make a small payment on a small farm, buy one and be your own master. Unless you are injudicious in your selection, you can, if necessary, get out of debt by again selling your farm, and while you keep it, the fact that you have a partial ownership in it will serve as an incentive to make that ownership complete, and you will save money to pay the debt that you would be likely to spend in unnecessary ways if it were idle in your pocket.

ELECTION.

JUST now the two contending political parties are working like beavers for the success of their respective candidates. We say *two*, because the third party appears to be but a sincere protest. The heart-burnings, the quarrels, the bickerings, the criminations, the lofty scorn, the haughty contempt, the slanders, the libels and the virtuous indignation of each party against the other, is now a matter of solid and actual reality. With some few of the politicians these things are matters of business and not of feeling; but with the larger part of the voting population they are for the time being sincere matters of feeling. Prejudice and a natural desire for the advancement of his own peculiar views, make all these things to the average voter stern realities, and we are not prepared to say that this is all wrong. That the whole matter of a Presidential Election could be carried on in a much less partizan and personal spirit, of course is true; but, after all, who is particularly injured by it? If injury results at all, it is to so small an integral part of the great whole of the country that it is swallowed out of sight by comparison. By all means, voting friends, if you enjoy that sort of thing, do it. But while you are in the whirl of the excitement, pause just a moment and smile at your folly. That, too, will do you good if you can enjoy it. Just think, for a moment, of the good time to come when one or the other of the much-abused candidates will be announced to be the successful man. The excitement all over, each of you who was successful will say, "I told you so," and forget the struggle, while each of you who belongs to the losing side will begin at once to prove to himself that it is not so bad after all—that the opposite successful side will not dare, in the face of the sovereign people, to do all those horrible things which you so much dreaded before election. Both being correct in your after-election judgment, here is where the laugh comes in.

In the meantime, whichever party wins, the sun will continue to shine, the heavens will not cease to endow the earth with refreshing showers, and the sure progress of nature goes right forward as it has always done, and always will do. And more than that, whichever candidate is successful, the good common sense of the American people, which is the ruling power in this happy land, will prevent that successful man from overturning cities by earthquakes or conflagrating any of our main channels of navigation. Relying upon this same good common sense, in which we have the utmost confidence, we think you may safely go to bed early on the evening of the 7th of November, covering up snugly if it be cold and, upon awakening, read the result, whatever it may be, without either fear or trembling. Now voters, smile at yourselves once more!

A SAFE PROPHESY.

BORROWING trouble, or conjuring one's imagination to find an excuse for believing that some dire calamity is likely to befall yourself or friends at no very distant period, is not a mental condition in which a person can take much pleasure. Still, it is better not to be over-sanguine of prosperity and pleasure, even of what may reasonably be expected in the future, for there is very little of what we might term a certainty in human affairs in this world; consequently, if one is to prophesy, let it be on the safe side.

For once, we propose to turn prophet and prophesy that the approaching winter is to be a very long and severe one to both man and beast. It is not necessary that our reasons should be given for making this prophesy, but we can assure the readers of the RURAL NEW-YORKER that they are good and sufficient for the prediction made. It is just possible that time will show us to be a false prophet; but as this can only be "proven" some six months hence, it will be safe to believe in us until that time arrives. Predicating ordinary operations in rural affairs upon the presumption that the winter now fast approaching is to be one of unwonted severity, every good farmer will pay particular attention to providing his stock with warm stables, sheds, and an extra quantity of food. The large cracks on the north side of his barn will be closed early and tightly and all the hay, cornstalks, and straw which is frequently permitted to go to waste, will now be gathered up and either put under cover or in a neat stock, conveniently situated for use when wanted. The corn must, of course, be gathered in early, as the first snow storm is to be a severe one, and in some localities the earth will remain covered until spring. The late potatoes, carrots, beets, turnips, and other useful roots that happen to get frozen in the ground, are very likely to remain there and be lost. It will be also safe to gather them very clean, leaving no small ones, for all will be required for your animals before warm weather comes again. In fact, let nothing be wasted which can be made available for food.

When the best provisions possible have been made to render the farm stock comfortable during the coming winter, it will be well to make a careful investigation into the condition of things about the house. The stock of dry wood on hand, or the quantity of coal, should be looked after, and if a cord too much of the former or a ton or two of the latter happens to be left over next spring, it will not be lost. But if we are a "true prophet," there is little danger of an overabundance of these articles being laid in. The winter also will set in quite early, and every one should be in haste in making the necessary preparations indicated above; and as there are to be many very cold, stormy days of too great severity for men to work out of doors, during which the children will be prevented from going to school, it will be both safe and prudent to have a supply of useful and entertaining books on hand and especially a good newspaper—for instance, the RURAL NEW-YORKER—with which to fill up the time profitably, that nothing may be lost; for even a leisure hour may be employed in gathering golden thought, if not gold itself. There is seldom danger in being too careful, although some may trouble themselves needlessly about what is to come; but in all rural affairs, safety on the score of extra preparation for winter—care of animals is a merit of no small consideration and value. If our readers will take heed and believe in our prophesy, we are confident that the RURAL will rank among the safe prophets, if not the great ones.

RURAL NOTES.

Ladies' Hats vs. the Birds.—A correspondent of the London Times, (Mr. ALFRED NEWTON), tells the ladies that they are responsible for the wholesale slaughter of birds for the sake of ornamental feathers. He refers to a single sale of feathers, to show that to supply that sale alone 9,700 herons (or egrets) must have been destroyed. All these feathers are said to have come from India last autumn. Mr. NEWTON observes that no country could supply 10,000 herons in a single breeding season without nearly rooting out the stock. Moreover, 15,000 humming-birds and upward were included in the sales, of which 740 were of a single kind. As far as we know, none of these birds really diminishes the stock of food available for man, so that in destroying them for mere show, we empty the world absolutely of a certain portion of its beauty and happiness, while the beauty is certainly by no means made up in the ornamentation of feminine toilets which is thus procured.

The Medical Director of the Centennial Commission, who bears the pungent name of PEPPER, has issued a labored report, showing statistically that Philadelphia is the healthiest place on the globe. While we have no desire to sneeze at PEPPER's report, we are obliged to notice that he takes no account whatever of the fact that nine out of ten people who go to the Centennial, return ill and remain so for a considerable time afterwards. Of course some of this sickness may be attributable to unusual excitement and fatigue; still, its existence should be well worth considering in his report. Though PEPPER is generally very penetrating, in this case he seems to have circumscribed his researches by the limits of the village of Brotherly Love and Lodgings. Go further, Mr. PEPPER, and *fair* better.

The Peanut Trade.—The cultivation of peanuts appears to be on the increase in those States where this plant succeeds best. The crop in North Carolina, Virginia and Tennessee for 1875–76, is reported to have reached nearly 800,000 bushels, and it promises to be still larger for 1876–77. From these statistics we may safely conclude that there is either a large quantity of peanut oil made, or a good many peanuts eaten by somebody.

Tanning Extract.—The extract of Sweet Fern (*Comptonia asplenifolia*), a low-growing shrub, with fine aromatic leaves, found over vast tracts of country, is said to be rapidly coming into favor for tanning purposes. Extract of alder is also another new product used for the same purpose, and it is but reasonable to suppose that many other native plants will yet be brought into requisition for furnishing a supply of tannin.

RURAL BREVITIES.

IT is said that Prof. HUXLEY received about $5,000 for his lectures during his late brief visit to this country.

THE Centennial Exhibition is about to close. Next week's RURAL will contain numerous illustrations descriptive of many of the Exhibits.

IT appears from our foreign exchanges that the "advance guard" of the Colorado Potato beetle has not, as reported, landed in Europe, although its near relative, the *D. juncta*, has. The ten-liner will probably go abroad next season, if it failed to find a free passage this.

BARON VON NOLCKEN has lately returned to Germany from Columbia, with 10,000 butterflies and moths collected in that country. It is such men as NOLCKEN, HUMBOLDT and other well known members of the titled nobility of Germany who aid advancement in the natural sciences in the Empire.

PROF. HUXLEY speaks in the highest terms of the great collection of zoological antiquities made by Prof. MARSH at New Haven. Prof. MARSH is certainly doing a great work for the present as well as future generations, and should receive the cordial support of every true friend of science and progress.

N. W. AYRE & SON, the well-known Philadelphia advertising agents, have been compelled to move to more spacious quarters to accommodate the demands of their growing business. During November they will be ready to receive their friends in the new Times Building (Chestnut and Eighth Sts.), where they will have unusually fine offices

IN the condensed crop reports received from the Commissioner of Agriculture of Georgia, we learn that the cost of living in the State is little more than half as much as it was seven years ago, and yet the farmers are saving but little money; the cause of the latter condition of affairs is attributed to a want of economy or calculation in advance of what a crop is to cost.

THE SAD STORY OF BLOBBS AND HIS PULLET.

In a tiny country villa lived our Blobbs, but all alone;
Never wife or chubby children this staid bachelor had known.
Yet—for hearts *must* cling to something—he had made himself a pet
Of a little snow-white pullet, with her wings just tipped with jet.
Daily feeding and caressing, these had won the pullet's heart;
Following close her master's footsteps, seldom they were far apart;
And his love grew deeper, stronger, with the passing of each day—
"Wiser far than any woman," wicked Blobbs was wont to say.
Near by rose a wondrous structure—architects their brains had racked—
Cross betwcen a Chinese temple and a cruet-stand, in fact.
This the pretty pullet's dwelling; here she hastened every night;
Perched on high, became a *rooster* till the dawning of the light.
One sad day a Yankee peddler, glib, persuading, passing by,
Gazed at Blobbs and that poor pullet with a calculating eye.
From his wagon's deep recesses drew out, smiling wickedly,
"Johnson's Patent Hen-Persuader;" then to guileless Blobbs said he:
"Here's a marvelous invention! In this box you see a nest;
Hens at once will lay an egg here, lured to do their very best.
Then behold! this sliding bottom lets the egg drop out of view,
And the hen, somewhat bewildered, lays at once egg number two!"
'Twould be useless to repeat all that this wily peddler said;
This suffices. Blobbs, unwary, by his specious tongue misled,
Bought the "Patent Hen-Persuader," set his snow-white pullet on,
Locked them both within the hen-house ere he went to town that morn.
Business then engrossed him fully, till, with num'rous cares beset,
Who can wonder that the pullet and her nest he should forget?
Nothing all day to remind him; but returning late at night,
Flashed a sudden recollection, and his cheek grew pale with fright.
Rushing madly from the station, straight he sought the hen-house door,
Called his pet in tones entreating. Ah! she'll never answer more!
Full of gloomiest forebodings, in he dashes; finds the nest
Overflowing with its treasures—yes, she's done her level best.
Forty-seven eggs! and near them head and tail and wings still lay,
For the poor ambitious pullet thus had laid herself away! [*Harper's.*

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Concluded from page 286.]

West Virginia.

THE separation of the northwestern portions of Virginia from the rest of the State had been long suggested, but it was not until 1861 that it was accomplished. In April of that year, a Convention held at Richmond declared Virginia no longer one of the United States, she having cast her fortunes with the Southern Confederacy. In this Convention the delegates west of the mountains were not unanimous, a majority of them voting against secession. Their action was approved and a Convention of delegates representing forty Counties was held at Wheeling in June, at which the act of the Richmond Convention was declared void, secession was repudiated and proceedings were had to reorganize the lawful Government of the State. The Government elected by the people by authority of this Convention—which was named the Reorganized Government of the State of Virginia—issued a call for a new State Constitutional Convention, which was held at Wheeling on November of the same year, 1861.

At this Convention a Constitution for a new State was agreed upon. The Legislature of Reorganized Virginia assented to its formation, and in December following President Lincoln approved the act of Congress admitting the State of West Virginia to the Union. As thus constituted, the State comprised forty-eight Counties, to which were subsequently added those of Berkeley and Jefferson.

Montana.

In 1864 an area that had successively formed parts of the Territories of Oregon, Washington, Nebraska, Dakota and Idaho, and which was bounded north by the International line, east by longitude 104, south by latitude 45, and west by the eastern line of Idaho, was erected into a separate Territory.

Wyoming.

The Territory of Wyoming, as constituted by act of Congress July, 1868, comprises the area between the 104th and 111th meridian and latitudes 41 and 45. It consists of two parcels taken from each of the original Territories of Nebraska, Utah and Oregon, and contains lands which have at different times been comprised in six other Territories, that of Dakota alone having twice included nearly one half of it. In laying it out no regard was had to so-called natural boundaries, and the Rocky Mountains cross it nearly diagonally.

YELLOWSTONE PARK.—A tract of land lying in the northwest corner of the Territory of Wyoming and included in its boundaries as given above, comprising about 3,800 square miles was, by act of Congress in 1872, withdrawn from settlement or occupancy, or sale under the laws of the United States, and dedicated and set apart as a public park or pleasure ground for the benefit and enjoyment of the people, to be and remain forever under the exclusive control of the Secretary of the Interior.

Unorganized Territory.

ALASKA.—In 1867, for the sum of $6,000,000, Russia ceded to the United States her province of Alaska. This cession was bounded on the east by a line beginning at the southernmost point of Prince of Wales Island (parallel 54° 40′) and running north along Portland Channel to the junction of the 56th parallel of north latitude with the Continent, and thence along the summit of the mountains parallel to the coast to and along the 141st meridian to the Arctic Ocean; providing that in no place shall this line be more than ten marine leagues from the coast and shall be parallel with its windings. No Government has yet been organized for this, the latest acquisition.

INDIAN COUNTRY.—By act of Congress in 1831, "All that part of the United States west of the Mississippi and not within the States of Missouri and Louisiana and the Territory of Arkansas," was named the Indian country. This area has been from time to time diminished, until at present it includes the territory bounded north by latitude 37, east by the western lines of Missouri and Arkansas, south by the Red River and west by the 100th meridian. Different portions of this country are set apart for different tribes of Indians settled there who have their own Governments, the three principal of which are the Creek, Cherokee and Choctaw. These are republican in form, and over them and the minor ones the United States exercise what might be called a Federal Protectorate. The country, for all necessary judicial purposes, is attached to the Western District of Arkansas.

There still remains without name or Territorial organization, the area comprehended by latitudes 36° 30′ and 37° and longitudes 100° and 103°. In tables of areas this tract, containing about 10,800 square miles, is usually added with the Indian Country.—[Conclusion.

The Story-Teller.

ONLY A COUSIN.

BY F. A. W.

A DINGY opera libretto slipped from Aunt JESSIE'S open desk to the floor near the "Sleepy Hollow" in which Cousin MARCIA was lazily reading. "'Barber of Seville.' PYNE & HARRISON troupe. Niblo's Garden, 1856. What are you keeping this old thing for?" and an arch peach-blossom face, with a fringe of fluffy blonde hair, suddenly thrust itself between Aunt JESSIE and the note she was just finishing.

That stately lady looked with some indignation over her eye-glasses. "Old thing, indeed!" she smoothed caressingly her recovered property, while over her face stole that curious, dreamy expression so tantalizing to the beholder, who feels herself shut out from some pleasant memory in which the other is reveling.

The peach-blossom was a persistent mortal in her way, however, and before Aunt JESSIE well knew what she was about, she was at the full tide of narration.

I think you never heard me speak of my friend, FANNY ELLIOT, who married and moved to Nevada a good many years ago. She would possibly be FANNY ELLIOT still if it had not been for this opera. She was passionately fond of music and her Cousin DAN always managed that she should hear everything worth hearing. FANNY was a teacher in a fashionable up-town school. DAN was a clerk in a large importing house in the city. Both cousins were alone in the world and were fond of each other in a cousinly sort of way.

FANNY was a good-hearted girl, only a little spoiled, like yourself Miss MARCIA, by injudicious reading. She lived altogether too much outside the everyday world, building castles in which the impossible angel of a man figured largely. It was amusing to hear her fancies. First of all, she must admire immensely the one she should marry. He must be one of the world's heroes—though just what this meant she could not have told you—and, by some lightning-like process of intuition, heart would speak to heart when she should meet him, and so on with the rest of that nonsense generally. If a person answering in some small degree to her ideal had suddenly appeared and at first sight had asked her to marry him, she would have unhesitatingly accepted, merely because she had so often mentally rehearsed the situation. Meantime, she did not suffer from lack of attention. DAN was perfection as an escort, and in his humble capacity of "only a cousin," obligingly made a martyr of himself, going to classical concerts which he did not understand and to the opera, which he cordially detested.

It was LOUISA PYNE'S benefit night and Niblo's was packed full from pit to gallery. Our friends had been fortunate in securing seats at the front balcony, thereby having not only a good view of the stage but of the audience as well—the latter consideration of importance to FANNY, whose peeps at the gay world were limited. One party near especially interested her that evening, and she had strange fascination watching them. The youngest of the group was a delicate, flaxen-haired girl. "MARGARET!" one would involuntarily exclaim, and look around for FAUST and the attendant demon. But instead, one saw a bald-headed, portly gentleman, doubtless the fair MARGARET'S papa. With the two was a lady fair, also, but not with the lily-like purity of the young girl. It might have been MARGARET again; but it was MARGARET twenty years older—more intellectual, mature, with that sort of "the-world-was-made-for-me" air, which naturally belongs to wealth and assured position.

FANNY confessed to me afterwards how admiringly and enviously she regarded these two women. What did they know about work and care, stupid pupils, fault-finding parents, fear of failure, longing for home and rest? Who does not sometimes wish to surprise the secret of his neighbor's content—to get at that vague something which we call individuality and which, no matter how hard our lot, we never feel quite up to the point of exchanging with another! "They must be very fortunate and happy," thought FANNY; "and I—my life has nothing!"

It was late in the evening as the curtain fell at the close of the fourth act. "How pretty that was!" suddenly broke out DAN; "like the wind through a forest of violin strings, was it not?" DAN was not musical, but he sometimes ventured an opinion at the risk of being severely put down. "I rather lost track of the words, though. Why have we no libretto?"

"What matters the words when you catch the effect so exactly?" was the answer he received. "It is poor music that does not tell its own story. But if your ears were as keen as mine, you would have heard the whole play discussed just back of us. These miserable amateurs! How I hate to sit near them. 'Good!' one would say; 'but the oboe is a little too prominent in that passage. Miss PYNE does not seem in quite so good voice to-night as usual; high notes are fine, but the medium register is poor,' and so on. Why cannot people listen to music to get away from themselves, for the comfort it brings, for the countless suggestions it inspires——"

"FANNY," calmly interrupted her cousin, "what have I heard you say ought to be the fate of the person who should tell the same story twice?"

"Good-by, DAN. Go and get your libretto."

As FANNY had said, her sense of hearing was exceptionally keen, and the whispered comments of the sociable persons back of her were distinctly audible. This time it was DAN who came under criticism as he passed by their box. FANNY would never tell just what was said—"the natural conceit of man is too great," she would reply, when teased on this point. She had listened, smiling with a proud sense of ownership, though it was only her cousin, when the final remarks made her cheeks tingle. "His wife, whoever she may be, is a lucky woman."

"Do you suppose she knows it?"

"Not likely. Most women never know when they are well off."

DAN'S wife! It seemed to occur to her for the first time that DAN would some time marry. "There is no one good enough for him, or pretty or rich enough, unless it be MARGARET over there," was FANNY'S thought. "And why should this not come about?" So many threads of romance were tangled in this young woman's brain, that it is no wonder she had quite a respectable web woven before the evening was over.

With new interest she watched the fair MARGARET of her fancy. So completely absorbed was she that the last act of the opera went on unnoticed until she was aroused from her dreams by her cousin's voice. "Are you asleep, or faint, or crazy, FANNY? I have been trying to get an answer from you for the last five minutes. You look pale. No wonder; the air is horrible. Let us get out of this," and DAN half carried her into the lobby.

The crowd was terrible. "Take care of the step." But DAN'S warning came too late. FANNY'S foot slipped. The crowd surged on. What followed she never clearly knew till she felt the cool refreshing air of the street. The fair neighbor of the opera stood near, and DAN was just returning to her a tiny silver smelling-bottle. "Why, it's MARGARET!" exclaimed poor dazed FANNY.

"How did you know that young lady's name?" inquired DAN as, after some biscuits and wine at TAYLOR'S, the two were slowly walking homeward in the sweet spring night.

"A mere guess. The name suits her. And how did she happen to be near?" returned FANNY, wondering a little at the quick, sharp, jealous pang that went through her heart.

"She was just getting into her carriage as I brought you out, and both she and her father came forward at once. I know him. A rich old speculator who drops into our store almost every day. That girl has a sweet face."

FANNY assented with another twinge of her heart-strings. "DAN," she commenced, hesitatingly, "I am afraid I have treated you rather shabbily all these years."

"Awfully so, FAN; but I'll forgive you if you will only keep in the body. You gave me a sad fright a while ago."

"Do you remember, DAN, the first time we ever saw each other—that summer so long ago at Uncle NATHAN'S? I was sitting on the plazza——"

"With a blue cloud twisted round your head and I thought you looked like an angel."

"Guy, more correctly; but then, you never did know the difference. And do you recall Uncle NATE'S comical introduction? 'FAN,' (rising inflection, and with a flourish of his big brown hand,) 'this is DAN.'"

"Yes, I remember perfectly. But why this sudden vein of reminiscence?"

"So many things came before me to-night. First, I was fascinated with MARGARET. I envy her. She has so much in the world—everything heart can wish. Then, when you went for the libretto, those persons back of us said something——"

"About you? Well," said the young man coolly, looking down with a curious smile at the form by his side, "I don't much wonder. I rather like your looks myself."

"Not that—I didn't mean—oh, you provoking fellow!"

"What have I done now?"

"DAN, have I then really been so very disagreeable all the time we have known each other?"

"Disagreeable? That's no name for it. Some fine morning, when I cannot stand it any longer, I shall take myself off. By the way; I had an offer to-day from your fair MARGARET'S papa to go out to Nevada. He happened to hear that I had graduated at the School of Mines at old Columbia and offered me very liberal inducements to look after the silver mines in which he is interested."

"Nevada? That is a long way off," said FANNY, helplessly; the world, without DAN, suddenly becoming a prospect too dismal to contemplate. "Perhaps you will take MARGARET with you. It is destiny. I believe you are the hero of her dreams, the one for whom she is waiting——"

"I declare, she is dazed yet from her fall!" was DAN'S muttered exclamation to this.

"You would suit each other completely," continued FANNY. "She is so good and sweet and winning. I envy her and I am afraid I hate her, too."

"What are you talking about?" and DAN'S cheery laugh was strangely reassuring. Then he added, very gravely:—"That poor little girl you envy would doubtless give all her world to be in your place. I did not mean to tell you the report about this family, but the mother has fits of insanity and sweet little MARGARET herself has twice been sent to an insane hospital. It is one of the dark fates."

They walked along in silence for a while; then DAN commenced with affected carelessness of tone, "See here! What do you suppose has been the reason of my keeping near you ever since the shy boy bloomed into six feet of manly assurance, enduring snubbing and neglect and disgraceful coolness"——

"It is false and you know it!" indignantly exclaimed poor inconsistent FANNY.

"What do you suppose has been the reason," pursued her cousin, unheeding the interruption, "that I have been content to stay here when I might have gone West and done work that would have amounted to something? Simply for the sake of seeing every day the one woman who always has been and who always will be the one woman of the world for me! Now you will laugh and call me a ridiculous fool! I dare say I am. Faith! I have half a mind to love the fair MARGARET. Perhaps she would treat me better."

"Love her at your peril! Take her away with you to Nevada, if you dare! I shall follow, for"—this in a very low, intense whisper—"I can't live without you, JESSE"——

"JESSE! Why that is papa!" cried Cousin MARCIA, in half-indignant amazement. "And you have just been telling me your own story all this time!"

OUR FIRST RACE.

WE have pulled our first race! The morning was beautiful as only a June morning can be. We took the shell down to Braman's last evening, and so the time hung heavily on our hands during the forenoon. A bulletin which attracted general attention was posted at the college bookstore in the square, as follows:

"HARVARD REGATTA.—The Annual Harvard Regatta will take place on the Charles River course this afternoon at three o'clock, wind and weather permitting. Four crews will pull—the Junior, Sophomore, Freshman and Scientific!"

We dined together at noon, on the usual leg of roast mutton—rare, juicy and tender—potatoes, spinach, ale; and for dessert, oatmeal mush. I think we were none of us hungry; and it was a silent meal, even Longstreet for once appearing thoughtful and quiet. I ate what I did purely from principle; for there was a queer sensation at the bottom of my stomach which took away all desire for food.

At half-past two the scene at Braman's was a stirring one. The crews were all there, wearing their colors, and had the boats out of water, cleaning and oiling them. As our boat had been put in perfect order, we were the first to launch and put out for a little pull; and it was a comfort to grasp the oar handle. The rafts were crowded with students, backers of their class-boats, and the cheers of our friends rang out as we darted away. Then came the drawing for positions. We had hoped to get the inside; but the Sophomores drew the first choice, the Juniors the second, the Scientific crew the third, and we had to take the outside.

Meantime the course had been cleared, the judges were at their posts near the upper stake, the starter, judges and referee were on board the barge; the rafts, platforms and roofs of the boat houses at Braman's were black with the crowd; the windows bright with ladies' dresses; the river-wall and sheds of the Beacon street houses were densely packed half a mile up stream. It was an exciting scene.

Bang! went a gun from the barge, the signal for us to come into line; and as we pulled up to take our positions we got nine cheers, though the boats were all greeted in the same way. We came into line as well as we could and lay on our oars. This waiting was the hardest part of all. If we could only have pulled away at once! I suppose it was only a few moments, but it seemed an age. I felt something pressing against my chest and I could hardly breathe. "Remember, boys," whispered Smith, "don't look around! See the boats behind you, if you see them at all, and be sure and don't miss on the start; two short strokes all together and then the long."

"Up a little, Freshmen!" "Back, Juniors!" called out Wilkinson, and now the line seemed to suit him. "Are you ready?" rang out in clear tones across the water. There is a hush in the crowd which every one can feel; we stretch forward. "Go!" and twenty-four oars dash the water. At the sound there is a great cheering and clapping of hands from the shore. I look at Lewis' back and pull, and almost immediately Smith says, "D—n! hold her, boys!" We were half a length ahead. The bow oar in the Scientific boat lost his head, steered wild and fouled the Juniors; and we had to go back and try a fresh start.

This time I did not feel the least nervous, but enjoyed the situation and the excitement. Soon we saw the Scientific boat behind us; and then came a glimpse of the Sophomores, hugging the wall for smooth water; and as we draw up to the stake it appears that we have the right to turn before the Juniors. "We've got 'em!" says Smith, "don't hurry, boys; they can't do anything till we get around!" But what with the sun in his eyes, and the glare of the sun on the water, Smith couldn't see the stake; and we shot past, leaving room for the Juniors to come up and turn inside of us, which they did as neatly as could be, and then dashed off down the home-stretch, the stroke kissing his hand by way of good-by. Nobody said a word; but there was a determination to make up the loss if it were a possible thing. I saw the other boats draw up to the stake and turn; and as the distance between us grew wider the sunlight seemed to wrap them in a gold and purple halo, most dazzling. After a time I could hear the swash of oars on the right. The temptation to look was irresistible. "Eyes in the boat," said Smith, coolly. "Steady! don't spurt till I give the word; we are doing well enough." So we pulled on and again I watched the muscles on Lewis' back; and soon the swash of the Juniors' oars grew more distinct, and presently I could see a little bit of the rudder by turning my eyes and then the stroke oar, and it was plain that inch by inch we had come up with them.

But we were getting home. The crowd had caught sight of us and the roar of the clapping of many hands and excited shouting comes over the water to us. "Now, boys, shake them off! hit her up, Tom!" shouted Smith, though Tom had quickened almost before the word; as for me, as soon as I heard the noise from the shore, I felt as fresh as if I had just stepped into the boat; but we had barely pulled half a dozen strokes at this tremendous pace when there was a *crack!* and Lewis' oar snapped at the rowlock. So we lost the race, though twice it was ours; for we were ahead of them at the stake and had passed them at the time of the accident.

We had a rousing reception; for we were only just behind the winning boat; and the boys on the raft didn't know what had happened till Lewis held up the broken oar, when there was the wildest time I ever saw. They wanted us to challenge the Juniors to pull the race over again. But Smith said No, it was all right as it was; he wasn't going to have us pull another race till we got to Worcester. And though it is a disappointment not to beat them if we can, I suppose the decision is a wise one.—[*Student Life at Harvard.*

WHAT IS AN INGRAIN CARPET?

THE two-ply ingrain known to the trade is a fabric comprised of two webs or "plies" of cloth, made with different-colored yarns—say one "ply" green, the other red—of equal consistence of texture, united at the edges or selvages of each by the selvage threads, and ingrained or united at different parts of the cloth, wherever called for by the design or pattern. If the red "ply" represents the ground color of the design, then the green will be the figure color; and whenever the green figuring "ply" appears over the red ground "ply," that is ingraining. The more general this ingraining or mixing up of the two webs or "plies," the better the fabric is ingrained and the longer it will wear. The three-ply ingrain is made and ingrained after the same manner. A two-ply carpet, woven on the same loom and "mounted" in the same manner as a two-ply ingrain, if woven plain, without any design or pattern, would be a seamless bag; a three-ply, under the same condition, a double bag, or two bags joined together by one side of each. The old Scotch two-ply ingrain weighed about twenty-four ounces to the yard; the weft yarns were heavier than those now used, and the warp-threads were three-cord worsted and much stronger and heavier than the two-cord now in general use.

Two things are gained by the substitution of the two-cord warp for the three-cord, though the fabric is rendered less desirable. One is the saving of worsted, the most expensive of the two materials which compose the fabric; the other is that the warp being finer, it permits a wide scope in shading the weft colors. This will be understood even by the unskilled reader if he will place an unequal number of coarse and fine black threads on two pieces of scarlet or white cloth or paper of equal width. The finer the black threads are the brighter the colors underneath will appear. Ingrain carpets are frequently called Scotch carpets, and by others Kidderminster. The difference in the nomenclature of the fabric, we presume, is due to the fact that, until 1821, Kidderminster had nearly a monopoly in making ingrain. In the memorable strike of that year, which commenced in March and continued until August, it lost nearly all its ingrain trade, which fell mostly into the hands of Scotch manufacturers.—*Textile Manufacturer.*

THE GERMAN GENIUS.

A GERMAN'S capacity of boring and being bored is inexhaustible. In the higher grade of the imagination they are encumbered with facts and observations and commonplaces. Their works are tedious beyond measure. In their poetry there is, for the most part, no irradiation—no fire to fuse and transmute it from substance to spirit. "The German genius," says Matthew Arnold, in his admirable paper on the study of Celtic literature, "has steadiness with honesty," while the English "has energy with honesty." But steadiness and honesty are qualities which, admirable as they are in life and in certain forms of literature, have little relation to the imagination, save in a very exalted sense. The poetic imagination takes slight heed of honesty. It has a higher office. It fuses while it uses, and in its glow of all things,

"Suffers a sea change
Into something rich and strange,"

it is often absolutely dishonest to real fact, and only true to ideal feeling. Fuel becomes flame in its enthusiastic embrace. What steadiness or honesty, in their common sense, is there in such lines as these?

"Take, oh! take those lips away
That so sweetly were foresworn;
And those eyes, the break of day,
Lights that do mislead the morn."

Literally this is absurd; ideally it is exquisite. There is no bane to poetry like commonplace, however true, however honest. But such graces as these are never snatched by the German muse, and she wearies us with platitudes and propositions. Even Goethe is so determined to be accurate to the fact, that in writing his Alexis and Dora, he stopped to consider whether Alexis, when he takes leave of Dora, ought to put down or take up his bundle; so at least Eckermann reports from Goethe's own lips. This is purely German in its literalness.—*Blackwood.*

HONESTY IS THE BEST POLICY.

ONE day, about three weeks ago, a strange customer came to a Gratiot avenue grocer. He wanted some goods, and he paid cash down. The next day he made another purchase and paid cash and as the days went by his face and his cash became familiar. One day he returned with the change given him and said:

"I believe I am an honest man. You paid me twenty cents too much."

The grocer received it and was pleased. Two days after that the stranger returned from the curbstone to say:

"Another mistake on your part; you overpaid me by forty cents."

The grocer was glad to have found an honest man and was puzzled to know how he could have counted so far out of the way. Three days more and the stranger picked up a dollar bill in the store and said:

"This is not my dollar I found it on the floor and you must take charge of it."

The grocer's heart melted, and he wondered if the world was not progressing backward to the old-time honesty. A skip of one day and then the honest man brought down a wheelbarrow, ordered $18 worth of groceries and would have paid cash had he not forgotten his wallet. He would hand it in at noon as he went past, he said, and it was all right with the grocer.

That was the last seen of the honest man. Morning fades to noon and noon fades away in darkness, but he cometh not. There are no more mistakes in change—no more dollar bills on the floor, and the grocer's eyes wear a far-off expression, as if yearning to see some one for about two minutes.

THE first day Artemus Ward entered Toledo, travel-worn and seedy, he said to an editor who was on the street:—"Mister, where could I get a square meal for twenty-five cents?" He was told. "I say, Mister, where could I get the twenty-five cents?"

The Literary World.

RECENT LITERATURE.

Mark Twain's Patent Scrap-Book. Manufactured in different sizes and styles by Sloat, Woodman & Co., New York.

HAD we been more acquainted with these books we should have called attention to them in an article relative to common-place books published in the RURAL of Oct. 14, page 255. Had MARK TWAIN never done any other good thing than the invention and introduction of this kind of scrap-book, he would not have lived in vain. It differs from the ordinary scrap-book only in that each leaf is partly covered with a preparation similar to that used on postage stamps and only needs moistening to make it ready for the reception of the cuttings. This invention will materially increase the number of books used, as it avoids all the trouble of paste or mucilage. It needs only the addition of a sheet of ruled paper in each book at the end in which to make an index, to render it complete.

Helen's Babies. With some account of their ways, innocent, crafty, angelic, impish, witching, and repulsive; also, a partial record of their actions during ten days of their existence. By their latest victim. Boston; Loring, publisher. (Paper; 50c.)

IF you have a journey of a hundred miles by rail before you, buy this book before you start. The large, clear type and open page make it well adapted for reading in the cars, and when once commenced you will forget everything but the story and your journey's end will be reached before you have an idea that you are half way. The name of the author is not given, but we have reason to believe in "One Summer," won an enviable reputation for a lady in Maine.

NEW PAPERS.

THE Laclede County Enterprise, a monthly journal devoted to local interests and edited by Dr. E. M. HARRISON, is a bright, progressive monthly, that will do yeoman's service in advancing the interests of Lebanon, Missouri, and the adjacent country. The subscription price is $1.

The Prescott Dispatch, published at Prescott, Ark., is an unusually well edited and printed local journal and deserves a success that, we have no doubt, it will realize.

The Western Stock Journal and Farmer has been enlarged and with its new title-page, practically makes a new start. Its appearance is such that it must recommend it irresistibly to those interested in the pursuits it so ably advocates.

The second volume of the Progressive Farmer, published at Evansville, Ind., is a credit to editors and publishers alike, and speaks well for the culture and progress of the farmers who, by their discriminating liberality, enable it to make so sprightly an appearance.

The Texas Stock Journal and Farmer, Pleasanton, Texas, is but another evidence of the prosperity and enterprise of the Lone Star State. It gives good, seasonable advice, which is printed on good paper, in clear type.]

COMING EVENTS.

THE December number of the National Review—A. S. BARNES & Co., N. Y., publishers—will contain very interesting papers from the pens of EDWARD A. FREEMAN, Dr. DORNER, Hon. EDWARD D. MANSFIELD, Prof. ANGELO DE GUBERNATIS and Princess DORA D'ISTRIA. In addition to his series of papers, covering, by their range and general interest a considerable portion of Christendom, Rev. SAMUEL OSGOOD presents an exceedingly interesting and instructive paper upon "New England Transcendentalism;" and there are the usual scholarly reviews of recent publications, American and Foreign, followed by the Science paper of Dr. WRIGHT, of Yale College, and the usual letter on European Art Matters, by PHILIP GILBERT HAMERTON.

JAS. R. OSGOOD & Co., Boston, Mass, promise an infinitude of good things for the fall and winter season. The following are the books that are to be published this month:—"Hymns of the Ages." New and cheaper edition; "Pacchiarotto, and how he Worked in Distemper," and other poems—by ROBERT BROWNING; "Doings round the Circle"—by BENJ. R. CURTIS; "LONGFELLOW'S Complete Poems;" "Gallery of Great Composers, with 24 Heliotype Illustrations; "LOWELL'S Poems;" "Poems and Places;" "Seashore and Prairie," by MARY P. THACHER. Uniform with "Little Classics."

HELIOTYPE ART-WORKS, each containing 24 full-page Heliotypes, with descriptive letter-press. Large 4to. Tastefully bound. Price of each, $10: "Gems of the Dresden Gallery;" "Gems of the Gray Collection of Engravings at Harvard College;" "The Titian Gallery;" "Gallery of Famous Artists;" "Gallery of Famous Beauties."

MAGAZINES FOR NOVEMBER:

Wide Awake, Domestic Monthly, Demorest's Monthly, Journal of Materia Medica, American Bee Journal, The Technologist, American Naturalist, Music Trade Review.

Sabbath Reading.

ALL THINGS PERISH SAVE VIRTUE.

SWEET morn—so cool, so calm, so bright,
The bridal of the earth and sky,
The dew shall weep thy fall to-night,
For thou must die.

Sweet rose—whose fragrance now I crave,
To glad my sense and joy mine eye,
Thy root is ever in its grave,
And thou must die.

Sweet Spring—so full of shine and showers
It makes the weary spirit sigh,
To think, with all thy herbs and flowers,
That thou must die.

Sweet music—e'en the lovely song
Which from thy harp in window nigh
Is floating on the breeze along,
E'en thou must die.

And all the bright and glittering train
Of stars that stud the deep blue sky
Must they all perish—none remain
To glad the eye?

And vales, and fields, and rushing streams,
And mountains that invade the sky,
Are they as baseless as our dreams?
And must they die?

And all that's beautiful and fair
Of Nature's face—love's melody,
That makes sweet music of the air,
All—all must die!

And man, frail form of senseless clay,
Tho' now his glance is proud and high,
Perchance upon this passing day
He too may die!

But the bright soul?—*that*, shrined within
The quenchless light in mortal form—
Tho' dimmed by misery and sin,
Defies the worm.

When all the stars shall fade away,
And suns in their own blaze expire,
And trackless comets cease to stray
With wand'ring fire,

The soul shall ever live, nor know
The lapse of time, but dwell on high,
And share—in endless joy or woe—
Eternity. [*Powell.*

CHURCH NOTES.

DR. BUCKNER says one characteristic of all Indian converts is that they behave well in church.

THE Wesleyans of England have published and sold a half million copies of their new Hymn-Book in a single year.

THE Chinese call Protestantism the "Jesus doctrine," and Roman Catholicism the "doctrine of the Lord of Heaven."

HERR REICHENSPERGER, the leader of the Catholic party in the German Reichstag, is reported to be dangerously ill at Gastein.

IT is announced that the lectures of the late Rev. Frederick W. Robertson on Genesis, will be published during the coming winter.

DR. NICCOLLS, of St. Louis, has been called to the pastorate of Prof. Swing's old congregation in Chicago, the Fourth Presbyterian Church.

THROUGH the active efforts of the "Buffalo Law and Order Association," the drinking saloons of that city have been closed on Sunday.

A SAN FRANCISCO paper reports in one issue the baptism of ten Chinamen—three in Sacramento, four in Los Angelos and three in San Francisco.

AMONG the students of the Congregational Theological Seminary in Chicago are three candidates for the ministry in the Reformed Episcopal Church.

MR. JOHNSON of Brooklyn, who is known in England as the "Gospel Temperance Lecturer," has accepted an invitation to visit Sweden and lecture there also.

THE funds raised by the "Turkish Mission Aid Society" of England for the sick and wounded in Bulgaria, are sent to the American missionaries in Turkey for distribution.

THE Protestant Episcopal congregation of Dorchester, Mass., which has worshipped "in a barber-shop since the beginning of the year," now rejoices in the prospect of a new chapel.

THE new church in London occupied by the Rev. Newman Hall's Congregation is so crowded on Sunday evenings that the adjoining Hawkstone Hall has been opened to receive the overflow.

THE Jewish Messenger states that for the first time there were religious services in the Sing Sing Prison on the opening of the Hebrew New Year. The Jewish prisoners, to the number of 40, were addressed by the Rev. Mr. Rabbinowitz.

AT the recent session of the New Jersey Universalist Convention, the Rev. Phœbe A. Hanaford was elected Secretary of the Convention for the year and was appointed to preach the Occasional Sermon in 1877. The Convention will then meet at Newark.

FIVE years ago the Swedenborgians began an effort to raise $50,000 in yearly installments of $10,000 for the publication of denominational books and periodicals. But little more than half of this amount has been obtained and a call is now made for the deficit—$22,558.

THE committee appointed to revise the Methodist Episcopal Hymn Book have invited communications from ministers and laymen in relation to; (1) Objectionable hymns in the present collection: (2) Worthless hymns; (3) Hymns damaged by injudicious alterations; (4) Good hymns not now in the Hymn-Book.

Ladies' Portfolio.

A STILL DAY IN AUTUMN.

I LOVE to wander through the woodlands hoary,
In the soft gloom of an autumnal day,
When Summer gathers up her robes of glory,
And, like a dream of beauty, glides away.

How through each loved, familiar path she lingers,
Serenely smiling through the golden mist,
Tinting the wild grape with her dewy fingers,
Till the cool emerald turns to amethyst.

Kindling the faint stars of the hazel, shining
To light the gloom of Autumn's moldering halls,
With hoary plumes the clematis entwining,
Where o'er the rock her withered garland falls.

Warm lights are on the sleepy uplands waning,
Beneath, dark clouds along the horizon rolled,
Till the slant sunbeams through their fringes raining,
Bathe all the hills in melancholy gold.

The moist wind breathes of crisped leaves and flowers
In the damp hollows of the woodland sown,
Mingling the freshness of autumnal showers
With spicy airs from cedar alleys blown.

Beside the brook and on the cumbered meadow,
Where yellow fern-tufts flock the faded ground,
With folded lids beneath their palmy shadow,
The gentian nods, in dewy slumbers bound.

Upon those soft-fringed lids the bee sits brooding,
Like the fond lover loth to say farewell,
Or, with slant wings, through silken folds intruding,
Creeps near her heart his drowsy tale to tell.

The little birds upon the hillside lonely
Flit noiselessly along from spray to spray,
Silent as a sweet wandering thought, that only
Shows its bright wings and softly glides away.

The scentless flowers, in the warm sunlight dreaming,
Forget to breathe their fullness of delight;
And through the trunced wood soft airs are streaming
Still as the dew-fall of the summer night.

So, in my heart a sweet, unwonted feeling
Stirs, like the wind in Ocean's hollow shell,
Through all its secret chambers sadly stealing,
Yet finds no words its mystic charm to tell.

FAMILIAR NOTES ON THE STARS AND PLANETS.

BY WILLIAM ROBT. BROOKS.

WE wonder how many Ruralites are star gazers; we hope a large number, for certainly no study more sublime can be engaged in than that of the heavens. Some of the most beautiful constellations are at this season of the year well situated for observation in the early evening.

Standing facing the north, we see in the northwest Ursa Major, or, as it is familiarly known, the "big dipper." The two lower stars in the bowl of the dipper are called "the pointers," because a line drawn through them upwards will intersect the north star or Polaris, which may always be found in this way, no matter in what part of the heavens Ursa Major may happen to be. In its apparent diurnal revolution about the pole star. Polaris is at an elevation, in the latitude of New York, of about 41°, and is the brightest star of the constellation Ursa Minor, meaning the Lesser Bear, and commonly known as the "little dipper." Very close to and just above the middle star in the handle of the "big dipper" is a small, faint star. These two are known as Mizar and Alcor, and through a good telescope Mizar—the larger of the two—is found to be a double star—two suns, in fact, revolving about each other.

On the opposite side of Polaris from Ursa Major, and at a somewhat greater altitude, is Cassiopeia, or "the lady's chair;" beyond which, and in the northeast, are the constellations Andromeda and Perseus; the latter containing the finest and most condensed cluster of stars in the whole heavens. It is easily visible to the naked eye, and through a large telescope with a low power is one of the most magnificent sights imaginable.

Well up in the eastern sky is the "square of Pegassus;" nearly overhead is the charming constellation Cygnus, or The Swan, its more prominent stars forming a beautiful cross, situated directly in the Milky-way. West of Cygnus is Lyra, readily distinguished by its leading brilliant, Vega. Near to Vega are two faint stars, forming therewith a little triangle. The one farthest north, if closely scrutinized, will be seen to be double. It is, however, a good test of eyesight to see it thus with the naked eye, but the smallest telescope or opera glass will show it to be a double star. Through a good telescope each one of these stars is seen to be again double, forming a quadruple system. A little south of Lyra is Aquila, the Eagle, three stars in a row, the central one the brightest, and called Altair. Just east of Aquila is the beautiful though not bright constellation Delphinum, or the Dolphin, a part of it forming a very perfect diamond-shaped figure.

In the western sky is Bootes, with its well-known first-magnitude star, Arcturus. And just above Bootes is Corona Borealis, or the "northern crown," distinguishable by a circle of rather faint stars.

Low down now in the southwest may be seen the planet Jupiter—the bright particular glory of our nights for many months—but which will now soon be lost in the sun's rays. In the southeast, and coming into excellent position for observation, is the planet Saturn. Its rings may be seen with a good telescope of even moderate power.

Venus is now "morning star," and may be seen, an hour before sunrise, glittering like a beautiful gem on the brow of the morning.

In a few months we will have another familiar talk about the winter constellations.

"Red House Observatory," Phelps, N. Y.

A DISAPPOINTED MAID.

MISS STOKES considers work very unladylike and kitchen labor "perfectly shocking." But when an industrious and sensible young man began to drop in occasionally and spend an evening, she very wisely refrained from expressing these convictions after hearing him on several occasions severely denounce the frivolity and indolence so fashionable at present with many of the young ladies of Philadelphia.

Entertaining a high regard for the young man, she determined to surprise him by some great feat of her industry and perseverance and last evening, as they were seated together on the parlor sofa, after the conversation had begun to flag, she artfully allowed a sigh to escape her.

"Are you unwell?" he tenderly inquired.

"No, I am quite well.',

"But you sighed," he persisted.

"Yes; but I suppose it was because I felt so tired."

"Have you been busy?"

"Oh, yes, indeed," was the reply. "Why, would you believe it? I cut out a *towel* and made it all by myself to-day."

There has been a coolness between the parties ever since, the reason of which he has never been fully able to explain; but she angrily remarked the next morning, that some men were foolish enough to imagine that a woman ought to be able to do more work than a fifty horse-power steam-engine.

EFFECT OF TEA ON THE SKIN.

IF you drop a few drops of strong tea upon a piece of iron—a knife blade, for instance—the tannate of iron is formed, which is black. If you mix it with iron filings or pulverized iron, you can make a fair article of ink. If you mix it with fresh human blood, it forms with the iron of the blood the tannate of iron. Take human skin and let it soak for a time in strong tea, and it will become leather. Now, when we remember that the liquids which enter the stomach are rapidly absorbed by the veins and absorbents of the stomach and enter into the circulation, and are thrown out of the system by the skin, respiration and kidneys, it is probable that a drink so common as tea and so abundantly used, will have some effect. Can it be possible that tannin, introduced with so much liquid producing perspiration, will have no effect upon the skin? Look at the tea-drinkers of Russia, the Chinese and the old women of America, who have so long continued the habit of drinking strong tea. Are they not dark-colored and leather-skinned? When young they were fair-complexioned.

PRACTICAL EDUCATION IN GERMANY.

A SCHOOL for ladies has been opened in Berlin on a plan decidedly novel, but very practical. The building contains lodging rooms for forty girls, school rooms, working rooms, an immense kitchen and a permanent bazaar. In the school rooms every branch that will fit the girls for situations in banking, commercial or mercantile establishments is taught. Various trades that ladies can follow are exemplified by skilled operatives. The kitchen is, perhaps, the chief school room, for all the work there is done by the girls under the supervision of one of the best cooks in the city. This feature has become so popular, from the large number of betrothed maidens who flock thither to obtain good domestic educations, that the managers have begun to charge for instruction in cookery, and the receipts generally pay the expenses of the other departments.

IT is a remarkable fact that, while contemporary historians describe Mary, Queen of Scots, as having black hair and gray eyes, an exquisite complexion, with hands delicately modeled and a majestic figure, most of her portraits at different stages of life have auburn hair and some even bright red. It is thought that she dyed her hair and changed its color according to the fashion of the day. At the Kensington Exhibition of National Pictures in 1866, no fewer than thirteen genuine portraits of Queen Elizabeth's unfortunate sister sovereign were exhibited. Lord Ronald Gower has just published an exquisite likeness of her taken in childhood, the original having been at Castle Howard for 200 years.

MRS. HOOPER writes that she has seen a miniature of George Sand when she was in the zenith of her beauty. "A handsome woman, though the lower part of the face is heavy and decidedly coarse. The brow is broad and noble and the eyes dark-blue, with drooping lids; dark, glossy hair, arranged *a la* Rachel. The dress of black velvet, low over the shoulders, with pointed waist, and the whole gives an idea of a beautiful, intellectual, but unrefined woman."

"YOU would make a most beautiful actress in the drama of life," whispered a poetical Chicago youth to his inamorata the other evening; "indeed, 'tis so—you would be a very star." "And you," murmured the fair one; and she leaned her frizzes on his shoulder, "w-wouldn't you like to support me?" So he arranged it right there. How could he help it?

THE truth is that our school-girls and spinsters wander down the lanes with Darwin, Huxley and Spencer under their arms, or, if they carry Tennyson, Longfellow and Morris they read them in the light of spectrum analysis or test them by the economies of Mill or Bain.—*Stedman's Victorian Poets.*

Reading for the Young.

THE HIGH, HIGH SWING.

Now listen while I tell you a very funny thing,
That once befell a little boy who had a splendid swing
A dreadful, dreadful, little boy, who dearly loved a riot,
And hated nothing on the earth so much as sitting quiet.

The swing of which I'm speaking hung between two high old trees.
And this boy, whose name was Harry—a naughty little tease—
Had a very tall, strong brother, who used to swing him high,
Up, up, and up, and higher up, till he seemed to touch the sky.

And yet that dreadful Harry was never quite content,
Although his brother swung him till his very breath was spent;
It was always "Oh, please send me just a little, little higher,
I long so much to see the sky a little, little nigher."

Now guess who looked and listened one wintry afternoon,
And chuckled to himself and grinned? The Old Man of the Moon!
Daylight had almost darkened, the stars were passing through the trees,
And all but very naughty boys had gone home to their teas.

A wild wind swept the garden-walks, the withered leaves whirled by,
The branches of the old trees creaked; and, though they scarce knew why,
The boys both felt a little queer and stared up at the moon,
And wished the blessed daylight had not died away so soon.

"Just one swing more, then we'll run home!" our rascal Harry cried,
"One high, high swing!" With all his might his big, strong brother tried
To send him up, and up, and up, far as the sailing clouds,
While the little twinkling stars came out and stared at him in crowds.

The Old Man in the Moon stooped down and gripped him by the hair,
And caught him up out of his swing and whirled him through the air;
Crying, "Now I hope you're high enough, you plaguey little boy!
And life among the moon-folk queer I hope you may enjoy."

Poor Harry's heart went pit-a-pat, his brain was in a whirl;
He almost cried—indeed he did!—just like a baby girl;
He begged the Moon Man to let go, and promised nevermore
To be caught so high up in the air where he'd no right to soar.

"At last then you are high enough?" the teasing Old Man said.
"Oh quite, quite, quite!" poor Harry cried; "please let me home to bed;
My head is running round and round, I don't feel well at all!"
Ere he could say another word the Moon Man let him fall.

Down, down, and down, and further down, the trembling Harry fell.
But oh, how glad I am to say, no accident befell!
He got to earth quite safe and sound, and scampered home like mad,
Vowing that ne'er again he'd be so wild a little lad.

Then youngsters all, both great and small, this fabled tale who read,
I beg that to its warning you will every one take heed;
"Enough's as good as a feast," be sure, in every kind of fun.
And now good-by—I'll say no more—my funny story's done.

CRAY THORNTON'S CHESTNUTS.

JUST at nightfall a rough-looking man was walking past "Chestnut Woods," when he fancied he saw some one gliding stealthily through the underbrush. He stopped and looked more closely; but now there was not so much as the rustle of a leaf to betray the presence of another. He turned into a narrow footpath, and at that moment a boy sprang up from behind a clump of bushes.

"Is this you, Cray?" the man exclaimed. "What on earth are you here for at this time of day? and what have you got in your bag?"

"I'm going home, and I've got chestnuts in my bag," was the reply.

"But I thought the chestnuts were all gone."

"They were almost all gone when I began to pick. But Mr. Oliver said I might have what was left; and so I've been in the woods every day this week. I've got every one there was."

"All right. But what made you skulk along so?"

"Because—because—I was afraid somebody would see me and tell father. If they did, he'd sell them for rum. Nobody knows, only mother. You won't tell; will you, Mr. Weston."

"Not a word, Cray. You needn't be afraid of my getting you into trouble. What have you done with the rest of your chestnuts?"

"Mother's hid them somewhere, and when Mr. Waters comes along, she's going to buy me some shoes with them. I haven't got any shoes."

"So that's it! Well, you need the shoes, and if you haven't quite enough, tell Waters I'll make it up. He'll trust me if I do get drunk once in a while."

"Oh, Mr. Weston! I wish you didn't. You'd be so good if you didn't; and perhaps father would be good, too, if he didn't drink rum."

"He ought to, with such a boy as you. If my Jimmy and his mother had lived, I should have been different from what I am now." And as he said this, Mr. Weston brushed the tears from his eyes.

"You won't meet your father to-night. He's got some money to spend before he'll come home; so hurry along to your mother, and good luck to you both."

The speaker was one of those men who are usually described as "good-hearted, kind and generous." He had a true Yankee genius for the Yankee trade of tinkering, and wherever he might go was pretty sure of being welcomed as the very person whose presence was most desired. He might have been rich, and yet he was poor, living in a bit of a house on the further edge of the wood.

After parting from Cray Thornton he walked slowly on, sometimes stopping for a moment, as he thought sadly of his wasted life. He was never ill-natured or quarrelsome, but he was his own worst enemy, and this he knew so well that he needed not to be reminded of the fact.

A week had passed when he saw Cray Thornton's father entering a grog-shop. He quickened his steps, and rushed in just in time to see the bag of chestnuts carried by Mr. Thornton poured into a half-bushel measure.

"Hold on there!" he exclaimed. "Those chestnuts are stolen property, and I can prove it. I've done some mean things in the way of drinking, but I never got so bad as to steal chestnuts from a boy. Thornton stole those from Cray. I know he did, and if there's not enough here to see fair play, it's a pity. Cray hasn't got a pair of shoes to his feet, and he picked those chestnuts one by one, after everybody else had given up. Thornton, you're a brute if you sell them for liquor. I never abused my boy, and if he'd lived he should not have gone barefoot such weather as this. If you've got any human feelings you'll stop drinking, and take care of your family."

"You're a fine fellow to preach!" was the sneering answer. "I'll quit drinking when you do."

"You promise that, will you?"

"Yes; I'll quit when you do."

"Then here goes—I've done with grog while I live. I swear it."

With his right hand still uplifted, Mr. Weston gazed at his companion with a fixed look, until the latter, as if moved by a sudden impulse, raised his own hand, and repeated, "I swear it'" reverently and solemnly.

"I will take back Cray's chestnuts," then said the father in a husky voice.

Without hesitation they were returned to him. The spectators were awe-struck by what had occurred, and the silence remained unbroken.

Mr. Thornton left the grog-shop, followed close by his friends. They, too, were silent. It was no time for talking; but from that day there was plenty in two homes where before there had been poverty, and happiness where before there had been fear and wretchedness.

LORD BROUGHAM ON GOOD BREEDING.

THE same observations which were made on the arts are applicable to a certain refinement of manners, which is common to all civilized states, but which, perhaps, arises in despotic countries at an earlier stage of society. This refinement, in itself, is of little merit or value. If, indeed, it is not rather to be accounted a defect. Its chief characteristic is luxurious indulgences of various kinds, and a politeness which consists so much in suppression of the natural feelings that it is nearly akin to falsehood. Never to say anything that may give pain, unless where our duty requires it, is a rule of sound morals as well as good manners. But never to say anything which those present may dislike; nay, from which they may dissent, is the rule of refined and courtly breeding. Absolute command of countenance and figure, calm, placid deportment, unbroken ease, sustained dignity, habitual smiles, indiscriminate respect; nay, the semblance of esteem or even love for everything that approaches, and the taking a ready interest in whatever concerns every one, but showing none at all in whatever regards ourselves merely—these are the constituents of highly refined and courtly manners; and these imply such an unnatural suppression of feelings; such a habitual restraint upon the emotions of every kind; such a false position of the mind at all times, as is most easily learned under the sway and the dread of a despotic prince or his provincial representative. Accordingly the manners of the orientals are known to be polite to an extravagant degree; while there is a want of polish in the subjects of free states which has made the roughness of a republican almost proverbial.

THE DAY YOU WERE BORN.

HERE is an infallible method of discovering the day of the week on which a given day of the month any number of years previous occurred. To the number representing your age at your next birthday, add one-fourth for leap-year; this amount divide by seven, and the remainder count back from the day of the week on which you were born. For instance, on your next birthday you will be 24 years old. This divided by 4, and the quotient, 6, added to 24, gives 30, the amount, which divided by 7, the number of days in a week, gives four weeks, and the remainder of two days. Now, if your birthday in 1876 comes on Monday, count back two days and you have the day on which you were born, Saturday.

CEREMONY is the smoke of friendship.

HE who finds pleasure in vice and pain in virtue is a novice both in the one and the other.

LETTERS FROM BOYS AND GIRLS.

Comicalities from Our Poet.

I saw two women in the street,
Walking, walking;
I saw two women in the street,
Talking, talking:
One was all ribbons and bows,
And the other was in her old clothes.

Says the one in red to the one in brown,
"Peggy, Peggy!
Why do you wear such a horrid old gown?
Peggy, Peggy!"
"I've another for Sunday," Brownie said,
"But why do *you* dress in your ribbons so red?"

"Do you suppose," answered she, with a toss,
"Spooney, Spooney!
That for fine clothes I'm e'er at a loss,
Spooney, Spooney!
Your penetration must be very small,
If I couldn't dress better, *I'd not dress at all!*"

C. H. C.

Of Course He Will!

MR. EDITOR:—I will endeavor to write to the Cousins. I have never read the RURAL before this year, and I am very much pleased with it. I always read the boys' and girls' letters first, and I think they are splendid. I agree with GYPSY BELLE in regard to piecing quilts. I pieced one when I was quite small, and mamma used to say it was good to keep little girls out of mischief. I am fifteen years old, and have dark hair and eyes, but I will not flatter myself, as did ROB ROY, by saying I am what the girls would call rather good looking. I should think YOUNG POET might favor us with some of his poetry. I like flowers, and it always makes me feel sad to have Jack Frost come, he is so destructive. And now, dear Uncle TRUE, I hope you will receive me as a Cousin and print my first letter, and oblige—MISS LOW.

More About Quilts.

DEAR UNCLE:—With your permission I would like to say a few words in regard to piecing quilts. In the first place, I would ask YOUNG EDITOR if he ever pieced a quilt? and if not, how he comes to know so much about it? He says, in his letter, "Girls, I will give you my opinion, and not charge one cent." I, for one, don't think it is *worth* a cent. Perhaps he will not be quite so confident that the boys *can* "hold their own" with the girls so easily when he sees all the letters that disagree with his. I notice a good many of the "belles" are against him.—MAY BELLE E.

An Economist.

DEAR RURAL COUSINS:—As my brother is going to write to you I thought I would write too: then we could send them both together and save three cents. Maybe you think I am stingy, but I am not. I believe in taking care of the pennies and the dollars will take care of themselves. I am a farmer's girl and like to live on a farm. I go to school winters and study Geography, Grammar, History, Analysis, Arithmetic and Composition. This is the first I have written for the RURAL. I guess I will go to the Centennial.—A FARMER'S GIRL, *Johnstown, N. Y.*

An Acquisition.

MR. EDITOR:—I have never written to the RURAL before, so I thought I would write. I am a boy and live on a farm. Father has taken the RURAL ever since he has been married, and his father has always taken it. I have two sisters and three brothers, so you see we can help father a good deal. We have our corn almost husked. I start for school soon and will continue until March. I am twelve years old. I hope to see this in print.—EUGENE P. J., *Johnstown, N. Y.*

DECAPITATIONS.—1, Larch—arch; 2, Slate—late; 3, Snail—nail; 4, Fox—ox; 5, Ball—all; 6, Teasel—easel; 7, Gaunt—aunt; 8, Swell—well; 9, Wheel—heel; 10, Glass—lass; 11, Flame—lame; 12, Acorn—corn.

MISCELLANEOUS ENIGMA.—The Lord will provide.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.90 for the two, may select any two of the following-named plants and a paper of the seed of the Moluccа Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory or garden. Its growth is rapid—small plants attaining the hight of five feet during the summer months. In the fall it may be cut back to any desirable size and potted for the winter, when it will quickly recover its symmetry and resume its ever-blooming habit. Its quick and exceeding popularity is a sufficient guarantee of its merits.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, now and old, this is as yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class. It is difficult to select a more attractive plant than Marie Lemoine when freely blooming. Every truss is in itself a bouquet. The leaves are large, zoneless, vigorous. The plant is compact and, like *Abutilon Boule de Neige*, is invaluable, either for the conservatory, window or garden.

Hydrangea paniculata grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It has stood 26° below zero unharmed. It begins blooming in early August, continuing until after hard frosts. The thyrses of flowers, first greenish-white, then white, then rose, often measure a foot in length and twenty inches in circumference. Every stem being thus terminated, the striking appearance of an entire plant may be conceived. There can be no doubt that this is one of the most valuable of all perfectly hardy shrubs.

Variegated Ampelopsis or *Vitis heterophylla variegata.*—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green, much as *Abutilon Thomsoni* is variegated with green and yellow. From its racemes of flowers are formed fruit as large as currants, each one of which is a different color in shades of claret, azure-blue and green. These berries, which are first as soft as a currant, become finally as hard as bullets.

The pretty stems are also variegated, green, whitish and rose. The roots are perfectly hardy, and the vine's growth so rapid that it will cover twenty-five feet square in a season. For conservatory walls or pillars, for trellises or rockeries, it cannot fail to please. It has been growing in the RURAL EXPERIMENTAL GROUNDS for several years without the least protection.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the singular Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

News of the Week.

HOME NEWS PARAGRAPHS.

THE day has come, when manufacturers can take calves feet and work them up into delicious strawberry jelly, and raspberry jam, but that's as far as they can go; when they can tackle a calf's head with success, some folks will be missed from society.

BY way of preparation for Mr. Moody's meetings in Chicago, which began Oct. 1, all the families in the city have been visited and an invitation to attend left with each. In this visitation the Young Men's Christian Association have largely cooperated. A choir of 500 singers has held two rehearsals a week under the direction of Mr. H. C. Stebbins of Boston.

Judge Younger, an uncle of the outlaws of that name, apologizes for his nephews and charges all the blame to the James boys. He says that they were going to the British Dominion, where they hoped to get something to do and settle down in peace. On the way there the James boys got to gambling and lost all their money; they then borrowed whatever money the rest of the party had, which they also lost. The James boys then swore they wouldn't travel without money, and resolved on the bank robbery.

The San Francisco Chronicle has the exclusive information that England's defence of Turkey is only make-believe, and that a great empire is to be established between the Bosphorus and the Adriatic, with the Duke of Edinburgh and his Russian wife (the Czar's only daughter) on the throne. The problem is now solved, thanks to the vigilant enterprise of the Chronicle.

It has several times been reported that the companies connected with the lately-disrupted coal combination were to suspend operations at their collieries, but nothing definite has been done in that direction until within the past few days. The operators have held meetings in the various regions; the sentiment of the majority was to allow each individual to do as he deemed advisable. Some of the independent operators in the Schuylkill, Lehigh, Wyoming and Lackawanna regions have shut down. They complain that the market is glutted with anthracite fuel, and there being no prospect of an elevation of prices to a profitable margin, they consider it unadvisable to continue mining for the present.

Now that the individual operators have stopped production, the great coal and transportation companies have determined to adopt the same policy. The Delaware and Hudson Coal Company has stopped work at all mines, and 15,000 miners and laborers are thrown out of work. The Philadelphia and Reading Company has reduced its operations about one-half. The whole number of unemployed persons in the coal fields is somewhere near 25,000, and accessions are being made to this number daily.

Red Cloud and 81 warriors left their agency, determined to go on the war-path. Gen. Mackenzie, receiving information, surrounded the entire band and disarmed them. The warriors surrendered. Red Cloud wanted to fight.

The Philadelphia Times states that a new clue to Charley Ross has been discovered by the arrest of one Samuel Benners, a friend of Mosher. Benners was examined, and after several interviews, said that Charley Ross was in Pennsylvania and had never been out of it; that he was not many miles from the city, and that he had seen him not longer than three weeks ago. Where the boy is Benners will not say, but the officers who made the arrest, and those who have been on the lookout for the last forty days, think that the boy is probably in Wrightsville, or in the neighborhood of Lancaster or Columbia, as in going to and fro between Harrisburg and Philadelphia Benners always stopped at those places. Wrightsville is a manufacturing village, and the officers are of the opinion that the gang made it their principal headquarters. Other arrests are in prospect, and it is said the police have been more actively at work in the case for the past month than at any time heretofore.

Stove coal at the last great auction sale went up to $4.10 per ton.

The Continental Life Ins. Co. of New York has failed.

New York is promised a new Opera House, to be called the International Opera House: cost $5,000,000.

The murderer of Maggie Bauer, McConochie, has made a voluntary confession.

Work on the Mississippi improvement at Cairo is to be commenced shortly, under $30,000 appropriation from Congress.

FOREIGN NOTES.

THE International walking match between O'Leary, the American pedestrian, and Crossland of Sheffield is looked forward to with eager interest. Crossland is the favorite in the betting at £10 to £6, with few takers. O'Leary has been suffering from indisposition for several days, which renders his success doubtful. The match takes place on November 1, and will occupy nearly three days. The distance is 300 miles and the stakes £200 and the championship of the world.

The Turkish Consul at Tiflis, and his wife, were lately murdered by robbers. Russia is making every effort to discover the perpetrators of the crime.

Spain wants an extradition treaty with this country.

Religious agitation has been begun in Morocco with the object of procuring help for Turkey.

The proposal to settle the terms of peace by a conference at which the Porte shall not be represented is opposed by England and Italy.

Col. Valentine Baker of railway carriage notoriety is now regularly engaged in the War Office at Constantinople, and is busy organising a plan for the remodelling of the whole Turkish cavalry. If his scheme is followed out, the Ottoman mounted branch of the service will become one of the finest bodies of mounted troops in the world. Part of the proposed scheme is that, at any rate for some years to come, commands in both cavalry regiments and squadrons are only to be given to English officers, or to officers trained in English cavalry regiments. It is believed that arrangement will not only give employment to a considerable number of half-pay English cavalry officers in Turkey, but will also induce many young Turkish officers to go to England for training in cavalry regiments.

A severe cyclone passed over the Central American States on the 3d and 4th instants. The town of Managua, in Nicaragua, was inundated on the 4th. About 400 houses were blown down by the hurricane. The inhabitants had to climb up on the tops of their houses to prevent being washed away by the flood. Many were drowned by the houses falling. The total damage done is estimated to be about $2,000,000. The town of Blanfield, on the Mosquito coast, in Nicaragua, also experienced the hurricane. Over three hundred houses were blown down. The Governor of Greytown visited the spot subsequently, carrying provisions, &c., for the relief of the sufferers. The same storm passed over the Lake of Nicaragua, causing an immense amount of damage. The loss on the coffee crops has been estimated at $3,000,000. About twenty lives were lost, the whole district around being completely flooded.

The Times has the following special from Berlin: The liberal newspapers here are almost unanimous in vigorous declarations against the establishment of Russian power in the Turkish provinces. The *Volks Zeitung* urges the propriety of placing reform therein under English, instead of Russian control.

A despatch from Berlin to the Pall Mall Gazette says an apparent trustworthy announcement is made that Russia has intimated her willingness to accept the Porte's latest armistice proposals with certain modifications not calculated to imperil the desired result. The proposal to settle the terms of peace by a conference, at which the Porte shall not be represented is opposed by England and Italy.

The building of the "City of Health" on the Courtlands estate, about a mile and a half west of Worthing, in England, will be commenced in the spring of next year. In the "City of health" an attempt will be made to carry out the idea of Dr. Richardson, as expounded in his description of "Hygia, or the Model city of health," at the Social Science Congress at Brighton last year.

Turkey has 140 post-offices in Europe and 170 in Asia. Of these 250 have existed only since 1868. Immediately around Constantinople there is an efficient suburban postal service.

The Prince of Wales is going to stay with Lord Londesborough, at whose house he caught the fever which so nearly cost him his life, but the visit this time is to be at a different place.

When races first came into fashion in France, the many went for fun, the few to bet. Now the betting element has assumed an alarmingly large proportion, and great sums are lost and won.

Some Argus birds, described as the most beautiful species in the world, have reached the Jardin des Plantes, Paris. They hail from the Philippine Isles. It is only within fifteen years that the first flying specimens came to France.

The following telegram give the gist of the European news of the week:—

The Montenegrins have cut Moukhtar Pasha's communication with Trebinje and invested Nipsic. Great distress prevails in Montenegro, notwithstanding the military successes because of the necessity of maintaining a large number of refugees.

The Roumanian chambers are convoked, meeting Nov. 2d.

The bullion in the Bank of England has decreased £163,000.

The Bank of France has increased its deposits 16,563,000 francs.

The British Arctic expedition under Capt. Nares, comprising the naval steamers Alert and Discovery has returned to Valentia. Progress to the North Pole was found impracticable. Capt. Nares reports that no land could be discovered to the northward of the highest latitude reached, namely 83 degrees 20 minutes, but in other respects the expedition was successful.

The Alert and Discovery left Port Foulke on July 29, 1875, and entered the ice off Cape Sabine. After a severe and continuous struggle they reached the north side of Lady Franklin Bay, where the Discovery was left in winter quarters. The Alert pushed on and reached the limit of navigation on the shore of the Polar Sea. The ice varied in thickness, being in some place 150 feet deep. President Land does not exist.

The Alert wintered in latitude 82° 27′. At this point the sun was invisible 142 days, and a temperature the lowest ever recorded was experienced. A detachment with sledges, was dispatched northward. It was absent 70 days, and reached latitude 83° 20′. Another party rounded Cape Columbia, the northernmost point of America, and traced 220 miles westward from Greenland, and also explored far to the eastward. These sledge parties met with no game, and suffered from scurvy. No Esquimaux were seen, nor were any icebergs met with beyond Cape Union.

SEMI-BUSINESS PARAGRAPHS.

FRANK MILLER'S LEATHER PRESERVATIVE and Water Proof Blacking received the highest and only award at the Centennial Exhibition.

THE RURAL NEW-YORKER wants good local agents. Address RURAL PUB. CO., 78 Duane St.

FRANK MILLER'S HARNESS OIL received the highest and only award at the Centennial Exhibiton.

INQUIRIES FOR ADVERTISERS.

[OWING to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents,"

so that each inquiry will appear under its appropriate head, either in "Inquiries for Advertisers," or "Answers to Correspondents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers, and while we shall not hesitate to give our reasons for excluding bad or doubtful advertisements, all such other matter will be admitted as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want, and the want is indicative of its need.]

B. W. Y., Monroe Co., N. Y., wants fine Leghorn poultry—will find an answer in our advertising department.

H. A. B., Dallas Co., Texas, wants full-bred Merino Rams.

W. G. B., Fairfield Co., Conn., wants a farm of from 200 to 350 acres in Southern Michigan.

R. G. M., Wyoming Co., N. Y., wants a good Hay Press. We refer him to advertisement of P. K. Dederick & Co., in this week's paper.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 28, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	76,750	Molasses	600
Whisky	2,855	Rice, bbls	2,636
Corn meal, bbls	200	Cut meats, pkgs	12,077
Corn meal, bags	557	Lard, pkgs	7,109
Wheat, bush	360,550	Tobacco, hhds	1,189
Corn, bush	1,311,491	do. pkgs	4,517
Oats, bush	256,900	Butter, pkgs	22,139
Rye, bush	64,169	Cheese, bxs	35,000
Malt, bush	61,257	Cotton, bales	32,767
Barley, bush	235,913	Rosin	1,432
Beans, bbls	5,208	Spts. turp., bbls	938
Grass seed, bush	12,616	Dried Fruits, pkgs	3,845
Beef, pkgs	1,568	Eggs, bbls	6,309
Wool, bales	2,179	Peanuts, bags	311
Hops, bales	2,029	Leather, sides	35,001
Pork, bbls	8,831	Sugar, hhds	—
Tallow	915	Oil cake	5,156

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports beans past week, 1,056 bush.; since Jan. 1, 49,351 do.; same time last year, 26,211 do. A moderate supply of beans, coupled with the increased cold and cooler weather, render the market generally firm, and in most instances prices are higher. The standard, medium and narrow, show a late advance. In the latter the export has improved. Few old stock beans are attractive enough for the current wants of buyers. Canadian peas are less active, but prices remain steady. Green peas scarce and firm; all new crop. Southern Black Eye peas quiet. Exports of field peas for the week, 11,641 bush.; since Jan. 1, 516,219 do.; same time last year, 252,431 do.

Beans—New medium, $1.65@1.70; do. marrow, $2.25@2.30; do. pea, $2.00@2.05; white kidney, $2.25@2.30; red do., $2.21; Old Beans—Medium, prime, $1.60@1.65; other, $1.30@1.40; marrow, prime, $2.16@2.20; other, $1.90@2.15; pea, prime, $1.85@1.95; other, $1.65@1.70; white kidney, prime, $2.10@2.15; other, $1.65@1.80; red do., prime, $1.70@1.80; other, $1.40@1.60; black, $2.70 Canadian peas, new, ₹ bbl., free, $1.12½@1.15; do. bulk, 93@95c.; green do., new, $1.50@1.55; do., S. B. E. peas (2-bush. bag), $2.20@2.25.

BEESWAX.—Exporters are doing but little and fair supplies give easy prices. Western and Southern quoted at 30½@32c.

Exports since Jan. 1st, 59,905; same time last year, 69,131 do.

BROOM CORN.—Supplies are increasing, while demand is very light and prices unsettled.

Quoted at 7@8c. for short green brush, 6½@7½c. for green hurl, 5@6c. for medium green, and 3@4c. for red and red-tipped.

BUTTER.—Exports past week 3,219 pkgs. The market is running in the easy pace that usually precedes the event of a Presidential or other important election. Receipts have fallen off but there seems to be quite enough for the present wants of trade, which fact is indicated by the shading of quotations in buyers' favor. Even best pails and creamery are off from last weeks extreme, and for all pkgs. the inside line of rates are the most prevalent in sales. Fine State Welsh is selling better than firkins or half tubs to the outside trade, and the local demand is calling for more of them usual. The lack of fine State is pretty well made up by a liberal receipt of Irish western dairy tubs, and for market use the difference in price makes it more quickly. Other grades of Western are dull especially factory packed. Shipping grades are held above exporters views, even if their wants were heavier than they are. It is due to sellers to say that much of the low grade stock is held by advice of owners. Roll butter is in market to a small extent ranging at 24@27c., with an occasional cloth wrapped lot bringing 28c. When roll butter has any selling merit at all it should always come in muslin. A warm day or two renders that put up bare, sticky and unsightly.

We quote:—Choice pails, 34@35c.; prime, 33@34c.; poor to good, 25@30c.; creamery pails, choice, 35@37c.; good, 33@34c.; sweet cream pails, 30@35c. State firkins, choice, 30@31c.; fair to good, 25@27c.; do. half firkin tubs, choice, 32@33c.; fair to prime, 26@30c.; do. Welsh tubs, choice, 32@33c.; other, 24@28c.; inferior State, 16@20c.; Western creamery, choice, 35@36c.; other, 32@34c. do. firkins, best, 21@22c.; other, 14@18c.; dairy tubs, choice, 26@28c.; other, 15@18c.; factory choice, 22@24c.; other, 14@18c.

State dairies quotable at 30@32c. with full tubs Welsh tubs, dairies, 26@31c.

State prime dairies 25@30c.

CHEESE.—The export movement has been very light again this week, and prices unsettled. For fancy late-made factories, owing to the high cost in the interior, 13½@13¾c. are held for colored and 13c. for white. The lower grades are depressed and sparingly dealt in.

Fancy factory, 13½@13¾c. for fancy white and colored September; do., job lots, 14c.; good and prime, 11½@12½c.; fair, 9½@10c.; State farm dairy, fancy, 11¾@12½c.; good to prime, 10¾@11c.; fair and good, 9@10c. Western factory, good and prime, 11@12c.; fair lots, 9½@10½c.; do. cheddar, choice, 12¼@12¾c.; do. flat, choice, 12½@13c.

Exports for the week, 14,270 boxes.

COTTON.—There is a liberal inquiry from exporters and more doing from spinners, giving a stronger market.

The latest quotations are:—October, 11@11 1-32c.; November, 11 1-32@11 1-16c.; December, 11¼c.; January, 11 15-32c.; February, 11 11-16@11 23-32c.; March, 11 29-32c.; April, 12 3-32@12¼c.; May, 12 9-32@12 5-16c.; June, 12 15-32c.; July, 12 19-32@12¾c.; August, 12 23-32@12¾c.

Quotations for spot cotton, based on American standard of classification:

DRIED FRUITS.—In apples German shippers are operating more freely in quartered lots. There is also more doing on home trade account, and prices generally firm. Peaches are scarce and higher. Blackberries and small fruits generally favor the seller.

Exports past week 2,745 bbls. dried apples; since Jan. 1, 10,871 do.; same time last year, 10,554. The export trade has suddenly caught up to the amount of business of last year.

Apples—State, sliced, 7¼@8½c.; do., quarters, 7@7½c.; Southern sliced, new, 6@7c.; choice do. 7¾@8½c.; fancy, 9@10c.; do., new quarters, 4¾@6c., the latter for repacked. Blackberries, 8½c. Peeled peaches, new, 15@17c.; unpeeled peaches, halves, 9@10c.; do. quarters, 8½@9c. Plums at 12@13c. Raspberries, 26@27c. Cherries, 17c.

EGGS.—Small receipts have kept the market buoyant and prices are firm at the late advance. Sellers dare not put up prices too rapidly for fresh, as the supply of limed, with comparatively low figures, might call off some of the consumptive trade. We quote:

Near points, 28@30c.; State and Penn., 28@—c.; Western, prime, 27@27½c.; do., other, 26½c.; Canadian, 27@27½c.

State limed, 19@22c.; Western, do., 18@20c.

FLOUR.—The more pacific character of the foreign advices has tended to limited dealings. The home trade is also moderate. Prices have not changed materially; if anything they are a trifle lower.

Sales at $4.00@5.00 for poor to very choice superfine State; $5.25@5.35 for very common to fair extra do.; $5.40@5.50 for good extra do.; $5.55@5.70 for fancy do., and $5.75@7.00 for fancy to very choice extra; $4.60@5.00 for superfine Michigan, Indiana, Iowa, &c.; $5.25@5.50 for shipping extra do., the inside price for interior, and $5.60@5.65 for choice to very fancy extra do.; common to choice white wheat extras, $5.70@6.75; fancy do. $6.85@8.00; winter whisk, good to choice family $6.50@8.25; round-hoop Ohio, $5.25@5.40, and trade brands of do. at $5.65@7.00; St. Louis, $5.50@6.50 for common to fair extra, and $6.55@8.25 for good to very choice; Minnesota "straight" at $6.75@7.75, and patent at $7.80@9.00; unsound stock at from $3.25@5.25; city mill extra for West Indies at $6.10@6.25; do. English brands, $5.35@—; do. trade and family $7.00@8.50; No. 2 at $3.90@4.20. Buckwheat flour is being sold at from $3.50 to $3.90 ₹ 100 lbs. Corn meal has a fair inquiry at $3@3.20 for yellow Jersey, Pennsylvania and Western, and $3.40 for Brandywine.

FRESH FRUITS.—Exports of apples, past week, 12,592 bbls. This heavy export demand is a good feature in the early part of the season, in fact it is difficult to say where prices would drop without it. The offering is large prices are extremely low for both fall and winter sorts. Most of the former are running out. Pears are more of sour quality; few good enough to reach the extreme. Quinces have a wide range. Grapes have advanced, the bulk having been sent forward. We are over-stocked with cranberries. There is only a moderate local demand and outside trade has not yet developed. Chestnuts have sold fairly this season, though prices have not been high. Over 3000 bbls. of La. oranges have arrived from N. O. during the month, 1500 on the steamer of this week. The export price is about $6 ₹ bbl. for stock. The new peanut crop will be abundant. We quote

Apples, State, ₹ bbl., fall $1.50@1.75; winter, $1.25@1.50; mixed, $1.12@1.25; good to fair, 87c@$1.00; common open heads, 50@75c. Pears—Duchess, $6@12; Seckel, Vicars, 5@7; Lawrence, $1@6; W. Nelis, $5@7; cooking, $3@4; California, Duchess and B. D'Anjou, $4 ₹ box; B. Clairgeau, $4.50; W. Nelis and E. Beurre not yet wanted. Quinces, ₹ bbl., $8@14. Cal. Quinces, $3@4 ₹ box; Cranberries, crates, $4.62@3.00; reg. bbls., $9@10.50 for eastern prime, $8@9 for N. J. good to prime; Grapes—Catawba, ₹ lb., 8@9c.; Isabella, 6@6½c.; Cal. Tokay, $6@ 80-lb. case; Malaga and Muscat, $3@4 do.; Black Prince, $3@4. Chestnuts, ₹ bush. $3@3.50. Hickory nuts $1.50@$2.; Va., fancy, $1.50; other $1@1.40.

GRAIN.—With the same dispatches from the other side, leading to an indifferent feeling among exporters, and the moderate trade in flour, causing millers to operate sparingly, prices are a trifle lower. Sales are at $1.19 for old No. 2 Milwaukee spring; $1.17 for new No. 3 Chicago spring; new No. 3 Milwaukee spring, $1.22½@1.23; amber Kansas, $1.30; $1.18@1.27 for winter red Western. Rye has a fair inquiry at 72@73c. for Western, 86@87c. for Jersey, State and Pennsylvania. Corn has a fair export demand and is steady in price; sales at 58¾@60½c. for mixed Western, 59¾@60½c. for high mixed, nearly yellow. Oats are in pretty full supply and prices are easy; sales at 32½@33c. for mixed Western, 41@47c. for mixed State, and 48@51c. for white do.

HAY AND STRAW.—There is an increased number of orders being closed out from the South, and the home trade is stronger, so that the increased supplies usual at this period of the year have not affected prices.

Bale hay 60c. for shipping; 70@90c. for retail qualities; clover, 50@65c.; salt, do., 55@60c. Straw quoted at 70@75c. for long rye; 55@60c. for short rye, and 45@55c. for oat.

Exports past week, 910 bales; since Jan. 1, 37,527 do. Same time last year, 33,731 do.

HIGHWINES selling at $1.12½ cash.

HONEY.—Prices are low, including new comb. We quote W. clover, 15@20c.; buckwheat, 10@14c. The California product is chiefly transhipped to London.

HOPS.—Exports for the week, 1,400 bales. The market is ruling steady on choice lots, which have a fair demand from exporters and increased call on home account. The lower grades are slow of sale and irregular in price.

New Yorks, good to choice, new	33 to 37
New Yorks, low to fair, new	25 to 32
Eastern, new	25 to 32
Yearlings	10 to 20
Olds, all growths	4 to 8
California, new	35 to 38

LEATHER.—Hemlock sole at 19@21c for light, 21@24c. for middle, 24@25c. for heavy, 19@21c. for good damaged.

POULTRY AND GAME.—The demand for live poultry is better, but no steadiness can be counted upon at this season. Early in the week prices ruled very low. About the only life in the trade is given by the very low grade of dressed arriving, city killers thereby having a brief prolongation of their work. We quote:

New Jersey turkeys, 13@14c. ₹ lb.; Western, 12@13c. N. J. fowls and chicks, 12@13c.; State and Penn., 10@11c.; Western, 10@11c., roosters, 8@9c. Geese, N. J., ₹ pair, $1.75@2; Western, $1.50@1.62. Ducks, N. J., ₹ pair, 11@87c.; Western, 50@65c. Live pigeons, ₹ pair, 25c.

The weather has been unfavorable for dressed stock most of the week, while the quality has run very poor. Latterly the demand has improved and prices are quite firm for good stock. A good deal of the early receipts sold at 8@9c. for turkeys, and 6@10c. for chickens. We quote:

Turkeys, N. J., 15@16c.; State, 13@17c.; Western, 13@16c. Chickens, dry-picked, 15@18c. N. J. chicks, 13@17c.; State, 12@15c.; Western, 11@16c. Ducks, N. J., 15@18c.; State, 13@17c.; Western, 13@16c.;

The game market has fluctuated considerably, owing to the varied weather, but is now rather more settled. Trade dogs not revive quickly after a showing of weather-softened birds, but easy prices will be apt to clear the market, with a few cool days. We quote:

Wild ducks, mallard, ₹ pair, 45@55c.; canvas-back, $1.00@1.25; red-heads, 60@65c.; teal and other, 25@30c. Quail, ₹ doz.; $1.75@2.50. Partridges, ₹ pair, 60@70c. Grouse, ₹ pair, 90@95c.; Hare, ₹ pair, 50@60c. Rabbits, 25@30c. Venison, whole, 10@—12c., saddles, 10@18c.; short, 13@15c. Woodcock, 10@55c.

PROVISIONS.—Mess pork is scarce for prompt delivery and some little inquiry for parcels to put upon contracts causes a sharp advance in prices. Bacon and lard have a stronger export demand. The quotations are for mess pork, $17.75 for spot, $16.25 for November, $15.75 for December, January and February. Bacon at 9@9¼c. for long clear and 9¾c. for short clear. Western steam lard at 9.95c. for spot and October, 9.82½c. for November, 9.75c. for December, and 9.82½c. for January. Tallow at 9c. for prime. Prime Western steam'ne, 10¼c. Beef hams at $19.75. Beef, barreled lots quoted at $8@10 for plain mess, $10@11 for extra mess, $13.50@14 for packet. Tierced quoted nominally at $19@21 for new prime mess and $21@23 for new India mess. City extra India mess at $27.

SEED.—Clover is quiet at 15½c. Timothy is lower, with larger supplies and dull; quoted at $1.90@2.05, as to quality. Rough flax, $1.60, which is higher.

SUNDRIES.—Feathers quiet at 55@58c. for live Western; 40@50c. for mixed. Ginseng, $1.10@1.20. Cider unchanged—8c. for large packages, 10c. for kegs. Essential oils are not quotably changed.

TOBACCO.—Exporters are operating quite freely in seedleaf, but doing little in Western leaf; prices for the latter are weak.

VEGETABLES.—Exports of potatoes past week, 5,787 bbls.; of onions, 405 do. The demand for potatoes is good, still with a large supply, a good many are selling at inside prices. Sweets continue very cheap. Onions are firm. Cabbages are firmer. Marrow squash low. Cauliflower plentiful and cheap.

Potatoes—Peach Blows ₹ bbl. $2.50@2.75. Early Rose, prime, $2.25@2.62; other, $2.12; Peerless, bulk, $2@2.25; sweet, Del. $—@2.12; Va. $1.75@2.25. Cabbages, ₹ 100, $4@7. Marrow squash, ₹ bbl., 50@75c. New Russian turnips, ₹ bush., 75c.@$1. Onions—Yellow, ₹ bbl., $1.75@2.25; white, $2.25@3.; red, $1.50@1.62. Cauliflower, ₹ bbl.; $1@2.

WOOL.—There is a very firm market; speculators have been operating, encouraged by the moderate stock and the prospective requirements of manufacturers on the temper of the goods market. Fine fleeces are hard to obtain. XX Ohio fleeces have sold at 48c., which is a further advance.

BEEVES.—Monday last, on a moderate run of horned cattle fresh to hand, trade was slow and the markets closed weak. Prices ranged from 6¾@10¾c. ₹ lb.; weights, 5@9½ cwt.; quality from poor to good—in general, coarse. Wednesday, trade small, the herds due not having arrived on time. Prices, 7@10c. ₹ lb.; weights, 6@8 cwt. Thursday, sales were effected at 8@11¾c.; weights, 5¾@9¼ cwt. Friday, the markets closed firm, prices having been 8@10¾c.; weights, 5@8½ cwt. From 36@38 lbs., net, has been allowed: general sales on 56@57 lbs. net. The quality of these herds was from poor to fair, with a good top. Spanish herds, direct from the Plains, 6¾@8¾c. ₹ lb.; do. fed east of the Mississippi, 8¾@9c. Native steers, grass-fed, 7@9¾c.; do. part corn-fed, 9¼@10c.; grain do., 10¼@10¾c. Dry cows, 7½@8½c. Oxen, 7@9c. Bulls, live weight, 2½@4c.

MILCH COWS.—Trade improved in fair quality cows, a better supply of which has been on hand. Poor quality cows generally held on sale. Fifteen cows sold at $55@65 ₹ head: 12 at $60@75; 5 at $70@81; 3 at $30@40; 4 at $45@50—calves always included.

VEALS AND CALVES.—Trade fair in smooth quality veals at 7½@10¼c. ₹ lb. General sales at 8@9¼c. Quotations almost exclusively from Central New York, with 50 head of Canada veals sold at 8½c. Coarse quality calves sold at 4@5½c. ₹ lb., also at $1@9.50 ₹ head. Canada calves, 4@5½c.; Western do., 5c.; State, 4¾@5½c.

SHEEP AND LAMBS.—On a heavy run of sheep and lambs trade has been slow at reduced rates. Sheep off ¼c. ₹ lb.; lambs, ½c. Monday, sheep sold at 4@6¼c.; lambs, 5@6¾c. Wednesday, sheep, 4@5¼c.; lambs, 5@6¾c. Thursday, sheep, 3½@5c.; lambs, 5@6c. Friday, the markets closed dull; sheep, 4@5½c.; lambs, 6@6½c. The quality of these flocks as above quoted, was from coarse to good. State sheep sold at 4@5c.; Ohio, 4½@5½c.; Canada do., 5@5c.; Illinois, 4½@4¾c.; Indiana, 5@5½c.; Texan, 4½@4¾c.; Kentucky, 5½c. State lambs, 5@6¾c.; Canada, 5½@5½c.; Bucks, State, Canadian and Western, 4@4½c.

HOGS.—Nearly 9 carloads of hogs have been sold on live weight during the past week. Rough State hogs, 5¾c.; ordinary State, 6@6½c.; Ohio, 6¾@6¾c. City dressed weak at 6¾@7½c., with selected market pigs at 8c.

HORSE MARKET.—City trade shady in inferior quality animals. Nineteen head poor quality light harness horses sold at $52@92 ₹ head; 22 do., $90@99 ₹ head; 11 do., $65@85; 32 ordinary quality, $110@125; 20 do., $119@135; 2 pairs family carriage horses, $275@400 ₹ pair; 3 pairs do., $300@500; 4 pairs stylish do., aged, $450@800 ₹ pair; 1 pair do., warranted sound, 6 years old, $1,300; 8 head brougham horses, quality coarse, $270@295 ₹ head; 11 head of roadsters, with fair trotting action, $200@300 ₹ head—not warranted sound; 3 ponies broke to saddle and harness, $90@115 ₹ head; 1 pair choice quality heavy draft horses, $600.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Oct. 23, 1876.

THE market has been dull and sales slow this week. About 4,000 boxes of farm dairy were on delivery and sales were made at 10¾@12¾c., the bulk going at 11@12c.

Factory cheese has been very slow of sale, the reduction in price from last week causing many to hold over for another week. White cheese is about ½c. lower than colored cheese, and sales have been difficult to be made, as the supply is now greater than the demand. The offerings from the factories aggregated fully 9,000 boxes, no more than a quarter of which changed hands. We quote sales at 12¾c., 13@13¼c. The bulk of the sales this week may be quoted at 13c.

Butter comes forward freely, but prices are lower. Firm dairy in Welsh tubs brought 27@28c, and "fancy lots," together with creamery, sold for 28@29c.

The weather is much warmer than last week, but grass is scanty both in pastures and meadows, and the herds are yielding a much less quantity of milk than for the same time last year.

Dairymen were very much disappointed at the tone of the market this week, both for butter and cheese, expecting an advance rather than a decline in prices. Buyers claim that the price for cheese must range at about 13c., while dairymen look for at least one cent more money. We shall look forward to next week's market with interest.

THE claim of Mary Ann Foster upon the Singer estate has been compromised for $75,000. The whole value of the property is $14,000,000.

MISS ALCOTT calls the Transcendentalists inspired lunatics. She ought to know, for her father was the biggest frog in that pond.

IT was feared lately that the vision of Senator Conkling's right eye would be permanently injured by the trouble he has had with it.

AN Albany woman sues her father to recover $5,000 for causing the death of her husband by striking him a fatal blow during a quarrel.

THEY kept up the Centennial Tournament Ball until long after mid-night. In fact, it's just as well to admit that it was an all-Knight affair.

WHEN Mr. Mulligan was wanted to go to Washington he was found in the barber's chair. Possibly Mr. Blaine may escape by a close shave.

HENRY WARD BEECHER says:—"An impudent clerk can do almost as much injury to his store as the neglect of the proprietor to advertise his stock."

A LOWER CANADIAN court has decided that reporters are not bound to give up the names of informants on whose statements they base their articles.

A TWO-MILLIONAIRE bishop in the Mormon Church, Hunter by name, is visiting in the East. There are vacancies in his household for a few more seals.

DAVID KNITTSL, a Fond du Lac, Wisconsin, miser, died last week of starvation, leaving property to the amount of $50,000, of which $20,000 was in cash.

WHAT Ireland says on the Eastern War question—"Yes, by the Powers."

MR. RAY MOSS of Kentucky, has just been acquitted of shooting with intent to kill. Under these circumstances no feelings of Ray-Moss need worry him at all.

THE swiftest vessel in the British Navy is the Shah. She carries 26 guns, and to be consistent with her name, should load them only with "Persian Powder."

OLE BULL is beaming in Boston; John Bull doesn't want any Turkey at his thanksgiving feast this year; Sitting Bull still refuses to repent and wear gum shoes.

THE editorial "we" is a sadly abused pronoun. For instance a country editor remarks: "We have 43,000 clergymen, 6,209 journalists and 875,000 domestic servants.

"DANIEL DERONDA" has an extraordinary sale among the educated Jews in this country as well as England. Its picture of a Jewish home is said to be marvelously photographic.

FROM PUNCH:—"Philanthropist—'There's a penny for you, my lad. What will you do with it?' Sweeper—What, all this at once! I'll toss yer for it, double or quits!'"

JEREMIAH HARRINGTON, who was said to be one hundred and five years old, was buried at Springfield Massachusetts, last Sunday. Four generations of his posterity attended the funeral.

MR. TUPPER is a short, chubby gentleman of sixty-five or thereabouts, dressed rather like a clergyman, with a plump, ruddy face, mild eyes, a head of fine silver curls and abundant full beard.

WHEN Prof. Huxley is ill he takes a large dose of molecular physics, but when he is under the weather Dr. McCosh at once sends for a metaphysician, who prescribes a nice soft syllogistic cataplasm.

MR. HENRY B. BLACKWELL of the Woman's Journal, says if Harvard should, next year, invite women to enter her classes, one hundred New England girls would avail themselves of the opportunity.

HENRY MOREHOUSE, the distinguished evangelist and Bible reader, is now in Philadelphia, reading to very small audiences. The Bible is the only old thing at the Centennial that fails to attract attention.

AFTER all his years of hard work, night and day as a journalist, John F. Cleveland left no property. It is reflecting upon such things as this that sustains the rising young editors of the hour in their arduous labors.

THE Caribou silver mine, in Colorado, which was once sold to a Dutch company for $3,000,000 has been purchased by Congressman Chaffee for $60,000, including mills and reduction works that cost double that amount.

THE Chicago Tribune thinks Mark Twain can never be a humorist again till he loses all his money. Mark will hardly go into training if he can help it. He would rather be a dramatist, and take for his share 101 per cent.

SOME one remarked the other day to General Toombs that they had seen an item in a newspaper stating that he had joined the Methodist Church, when the General replied, "Yes I knew it was a lie as soon as I saw it."

M. DE MOLINERI beheld at the tenth mile underground in the Mammoth Cave the dreadful advertisement "Gargling Oil." "Immediately," he says, "I looked on all sides for 'Sozodont.' 'Sozodont' was not there! Thank God!"

A YOUNG man in Chicago sang "Come and Kiss Me, Little Sweetheart," under the window of his girl's house, supposing that she was leaning out; but it was her father, as the young man well understood when a pail of water was emptied on him.

DARWIN will be seventy-nine years old on the 12th of February next, and on that day an album will be presented to him which will contain the portraits of all the principal monkeys—that is to say, of the principal Darwinian scientists of Europe.

CHICAGO sells five million dollars worth of jewelry and San Francisco gets away with ten million dollars worth of drinks, of all grades, every year. The aggregate annual sale of testaments and hymn-books in the two cities reaches $175.27.

THE old Court House in Rappahannock, Va., in which John Waller, Robert Ware, John Shackleford and James Greenwood were in 1774 arraigned for preaching the Gospel contrary to the law of the colony, is to be converted into a Baptist Church.

IT is remarkable that at a time when the depreciation of silver is causing universal anxiety, China is simply devoid of coin. Interest has run up to 36 per cent., and money is hardly obtainable at that rate in the Shanghai market. The hoarding of coin is carried on extensively throughout the Celestial Empire.

A NEW YORK paper offers, as premiums for its subscribers, an annual cutting of the hair or quarterly vaccination free, and to those who pay three years' subscription in advance, a coffin at death, or, when it is preferred, half a dozen silver plates. There can be no doubt as to the truth of this, for it is printed in a Paris newspaper.

THE editor of a country paper wrote one evening:—"To-day is the anniversary of the death of Louis Philippe." When the printer's proof came up, the name read "Sam Phillips." The editor wrote on the margin, "Who the deuce is Sam Phillips?" Next morning the article read:—"To-day is the anniversary of the death of Sam Phillips. Who the deuce is Sam Phillips?"

Implements and Machinery.

Centennial Year of American Independence,

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you samples of the Celebrated Watches, manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION. These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, fine Ruby Jeweled, set in Clinton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend as a present, at our lowest club rate—only $2.00, including postage.

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

Mrs. T. J. Louck, Lowville, Lewis Co., N. Y.—I inclose a leaf and blossom taken from a plant that came up beside a tea plant that a lady brought from the Smithsonian Institute this summer. Will you please tell the name in the RURAL NEW-YORKER and oblige a reader?

It is *Chenopodium ambrosioides*, var. *anthelminticum*. It grows in almost all parts of the United States, but is more abundant in the southern parts. It is commonly known as Jerusalem Oak or Wormseed. The seeds are very small, and are possessed of an oil upon which their properties as an anthelmintic depend.

Frazer.—You may sow the seeds of Gladioli now in pots. Rest them for a month in spring and plant in the open ground. The corms will then average, in size, small peas. Again pot them in the fall after resting. In this way many will bloom the second year. You must have a sunny exposure. The temperature, if above freezing, matters little at night. Merely cover the winged seeds with light soil and drain the pots well. Seeds of *Hibiscus Syriacus* may be planted in the same way. They will bloom next Fall. The seeds germinate readily. They will not generally reproduce the parent flower.

J. B. T., Queens.—We have tried both Rosendale and Portland cement and find less difference in quality than in price.

H. J. Fuller, Castele, N. Y.—Can you name the inclosed wild vine? *Chiogenes hispidula.* Creeping Snowberry.

W. B. T., Indianopolis, Ind.—I have a raspberry patch, on which a large number of "sets" which I wish to preserve to the latest possible period next spring, for the purpose of planting on plot where are now strawberry plants, which are to be used in the spring for the formation of a new plantation. How can I best keep them over? I am desirous of heavily mulching my raspberries this fall, hence the necessity of removing the young plants. An answer in the inquirers corner will very much oblige.

Take up the young canes which you desire to use next spring so soon as the frosts have killed the leaves. Shorten the canes to about one foot long, then heel in the plants for winter. If you desire to retard growth in spring, select some shady spot for heeling in—for instance, on the north side of some building or board fence. Toward spring, when the ground is hard frozen, the plants may be covered with coarse hay, straw or leaves, and this will, in a measure, prevent thawing out very early; but if buried in a shady spot, the buds will not be likely to push until after your ground has been cleared of strawberry plants next spring, provided the transplanting is done early.

Albert Hatch.—We cannot account for the change in the color of your colt, but such freaks of nature do sometimes occur without offering us any clue to causes.

C. B. A.—I have just transplanted a dozen fruit trees averaging six feet high and three feet in diameter. Will it be necessary to stake them? If so, what is the simplest and most effectual method? ANS.—Yes, it will. The simplest and, indeed, one of the best methods we know of is as follows:—Drive a stake diagonally into the side of the hole at such an angle that it will rest against the stem a little below the lowermost branch. This stake will then form with the stem and ground a right-angled triangle—the stem being the perpendicular, the ground the base, and the stake the hypothenuse. Use a thick line or straw bandage to secure the stake to the tree, passing it between them so as to avoid chafing, and tie securely and closely. In this way one stake may be made to answer the purpose of two, three or four, as are sometimes employed.

Mrs. James Wilson, Bawlings Station.—I inclose you leaf and bloom of a plant which ought to have been forwarded some time ago, but I risk them yet, as I am anxious to ascertain their name. The root is similar to an Irish Potato, and is stored away dry every winter until the third year, when it blooms. It grows to the hight of 15 or 18 inches and throws out a single flower stem, tall and slender. The flowers are a delicate yellow and come out, one after the other, like a Tube-rose. It is in the 2d order, 5th class, in Botany, and comes nearer to Amaryllis or Atamasco Lily than anything I can find, though it differs. The root was brought from a greenhouse in Nashville, Tenn. The lady who brought it forgot its name, and it seems to be a stranger to all here who have seen it. Will a Tube-rose bloom the second time from the same root? Please answer through your paper. ANS. The flower is *Gesneria.* The Tube-rose bulb will not bloom twice.

M. W., Poquonoc Bridge.—Inclosed find seed for name. It was sent to me for Climbing Pea. Is it a perennial? I thought I knew all the peas, but have seen nothing of this sort before. Are Portulacas anywhere known by the name of Rose Moss. ANS.—It is a perennial. Portulaca is sometimes known by the name of Rose Moss. Envelope received.

N. P. Nelson, Princeton, Minn.—I want to know the best way of raising poultry. Please let me know if you have any good, responsible book on the subject, and oblige.

ANS.—We suggest to our correspondent that he watch the columns of the RURAL NEW-YORKER. We are giving especial attention to this important and, as we think, much neglected branch of farm economy. Wright's Practical Poultry Keeper is as trustworthy and instructive as any authority we know of.

E. A. Crawford.—The reason that salted meats cause scurvy is that the salt abstracts the potash, and if potash is sprinkled on the food as one sprinkles salt, the difficulty is averted.

Dry Goods, &c.

LORD & TAYLOR

BROADWAY AND TWENTIETH STREET. GRAND, CHRYSTIE & FORSYTH STS., N. Y.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper* and in Premiums to Agents.

Are you going West, North or Northwest?
You want to know the best routes to take?
The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oskosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.
This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.
This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.
For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

BETWEEN

NEW YORK AND CHICAGO

via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York.

9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only line running Hote Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

MOORE'S RURAL NEW-YORKER contains Sixteen Quarto Pages weekly, finely and profusely Illustrated and neatly printed. Only $2.50 per year, $2.00 in clubs of ten or more, postage paid. Great inducements to Club Agents. Specimens, Premium Lists, &c., sent free.

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lewis of Life.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

Wit and Humor.

GOSPEL ACCORDING TO JOHN.

SOME years ago, being in Philadelphia, John Cockerill of Ohio, now of the Cincinnati Enquirer, received an introduction to a prominent divine of that city. The reverend gentleman invited him to attend his church on a certain Sunday, which invitation was accepted. They entered the sacred edifice together. It was one of the first churches in the city, and its members were fashionable and aristocratic in the extreme. The minister put John in an elaborately furnished pew, well to the front. John nestled comfortably down into one corner of the same, and looked about as interested and contented as a toad under a cabbage leaf.

After a while the owner of the pew arrived, and at once gave signs of intense disgust and indignation at the presence of the interloper. He looked at John, looked at the pew; and scowled magnificently, and finally, after fumbling through his pockets some time, drew forth a card and wrote on it with a pencil: "This is my seat, sir?" and with an air of loftiest contempt, tossed it over to John. The latter took it up and read it, with that lamblike meekness peculiar to himself, and then, with the most delightful coolness, wrote in reply: "It's a devilish good seat. What rent do you pay?" and tossed the card back to its owner.

The latter took it, looked at it with the most profound astonishment a minute or two, and then a broad grin overspread his countenance. He evidently enjoyed the coolness and brass of his new acquaintance, and when service was over he approached John, apologized for his rudeness, invited him to his house, gave him the best he had, and treated him with the greatest respect and consideration during his sojourn in the city.—*New Haven Register.*

SPARKS AND SPLINTERS.

ON the channel, where the voyage produces its usual effect, an economical lady cries:

"What a pity! A breakfast that they charged so much for, too!"

MR. BOWLES has got the patent for his new tin hen. He fills the thing with oyster shells, boiled starch and extract of carrot, winds her up, puts her on a nest, and she will lay an egg every day for a week. He has a way of keeping her from work on Sundays.

A CLOSE-FISTED man invited a friend to dinner, and provided only two mutton-chops. Upon removing the cover he said, "My friend, we have a Lenten entertainment; you see your dinner before you." Taking the two chops upon his own plate, his friend replied, "Yes, but where is your dinner?"

A WITNESS for the prosecution in a murder case was thus questioned by his Honor: "You say you saw the man shot at and killed?" "Yes, sir." "You said, I think, that the charge struck the deceased on his body, between the diaphraghm and the duodenum?" "No, sir; I didn't say no such thing. I said he was shot between the hog-pen and the wood-house."

Two joyous citizens meet a third.

"Hullo, Marius! We are just off for a picnic. You'll come?"

"I can't my dear fellow; the fact is, I am ruined, and have no more money to spend on pleasures."

"That makes no difference. Come along, anyway. If you have no money, why you can watch us."

WHEN Louis XV., the Well-Beloved, was passing through a town in the north of France, his reception being of the most enthusiastic, an old woman was suddenly seen to dart through the ranks of the military escort, crying: "Let me see him! Let me see him!"

The king stopped his carriage, addressed a few kind words to her, then continued his progress.

Then the old woman flung her hands into the air and, with all the rapture of pious Simeon, cried:

"Thank Heaven! I have seen him! And now I don't care how soon——He dies!!"

"WATER! WATER! WATER!"—Gen. Des Pallieris, just dead, during the campaign in Cochin-China had a native servant, very intelligent, very faithful and very lazy. After a long day's march the General was awakened at midnight by the moaning of his servant, who, stretched on a mat at the entrance of the tent, was sighing to himself: "Water! Water! Water!"

The General calls out: "Hallo there! Quick! Stir yourself!"

The servant approaches painfully.

"Get me a glass of water, and be quick about it."

The servant departs, grumbling, but returns speedily with it.

"Here is the water, General."

"Then drink it yourself and let me sleep."

GALLANT.

URCHIN.—"Hey Sally pop on yer hat, and rap yer self up warm, an I'll take yer fer a drive in *my dog-cart.*"

BUILDING PAPER!
FOR SHEATHING, ROOFING, DEAFENING, CARPET LINING, AND PLASTERING

These are the best and most economical goods; impervious to dampness, heat and cold. Send for samples to B. E. HALE & CO., 56 and 58 Park Place, New York.

RURAL RATES REDUCED!

IN announcing the reduction of the subscription price for THE RURAL NEW-YORKER, we can only say that it is done in a spirit of justice to all our subscribers, who are now paying reduced prices for everything. The old price for THE RURAL has been $2.65 per annum, and the

Present Reduced Rate is $2.50 per Annum,

and in clubs of ten or more, $2.

Great encouragement has been given us in our efforts to make the

BEST ILLUSTRATED

Agricultural and Family Weekly

over published, and we make, in this Centenary Year, this substantial acknowledgment of it. It now costs us less to make the paper, and we propose to give our subscribers the benefit of every cent of the reduced cost.

ALL WE ASK

is that each subscriber and agent will continue his efforts to increase our list so that we can make a still further reduction.

The cheapest paper is not always the best, but

The Best Paper is Always the Cheapest!

Subscribers, show THE RURAL to your neighbors and ask them to subscribe. They will be benefited and you will be profited.

ALL AGENTS ATTENTION!!!

The Centennial.

REVIEW OF THE RESULTS ATTAINED IN A CENTURY OF NATIONAL LIFE.

PHILADELPHIA, Nov. 9, 1876.

ONE day intervenes before the close of the Centennial Exhibition, and a review of the results attained in a century of national life is appropriate.

We see ourselves as others see us when we note what our foreign visitors have to say concerning the national display at Philadelphia. The English, Belgians and Russians express themselves as astounded at our progress in the Mechanic Arts. Our Corliss Engine and other mechanical works were a revelation to them. A German engineer exclaimed in broken English, "Ef you do dis t'ing in one hundert year, what you do in two hundert? You *fly!*" emphasizing his words with a very comical use of his arms. The French see nothing to admire in either our works or institutions, and one of the Commissioners of this volatile nation, gathering his ideas at second-hand, has even gone so far as to publish a letter in which he slurringly generalizes on our progress and descends to the impertinence of reflecting on the virtue of our women. We are great enough as a nation, however, to smile with pity on such petty malice. It may be safely surmised that the foreign exhibitors, as a rule, have made money and will leave our shores with very comfortably-filled purses.

English observers have become justly alarmed at our progress and freely prognosticate that Americans will meet Britain on terms of equality in the markets of the world, and that nothing but the utmost vigilance will prevent us from gaining the ascendancy. This is praise indeed. The influence of the Exhibition on foreign peoples can hardly be over-estimated. Their representatives came here with the idea that the traces of the bison would be found in the environs of the City of Brotherly Love; that our fashionable dance was the War Dance, and that æsthetically, we were about as crude as we were in the days of Irving's Knickerbockers. Acting on this supposition, they did not send to our shores their finest wares, but discriminated in favor of gew-gaws that would be likely, they thought, to please our savage tastes. The English, Russians, Spanish and Japanese are worthy exceptions, however. The Germans, with one or two exceptions, send an invoice of meretricious stuff. In their purchases Americans have discriminated with taste, rejecting, in most instances, such articles as the exhibitors supposed would appeal most strongly to their barbaric instincts. On the other hand, our Art exhibits have been freely patronized, one firm of silversmiths aggregating $8,000 worth of European orders. It is conceded that some of our Art work is fully equal to that of older nations, and as far as our Farm Implements and Mechanics are concerned, we are second to none and surpass most.

In an enterprise of such magnitude there must be more or less dissatisfaction, but the management has been generally most efficient and satisfactory. The Exhibition opened on the day advertised, something quite the reverse of the Vienna Fair, and since then has pursued the even tenor of its way, with but few drawbacks. Some of our exhibits have been scandalously mismanaged, as the Butter and Cheese Building, for instance, which has been fully shown up in the columns of this journal. The *fiasco* of the field trials, which were shorn of any permanent value by the combined action of certain agricultural implement manufacturing firms, has also been exploited in the RURAL'S columns; but the Commission was only partly blamable in this affair, having been weak enough to yield to a powerful influence that was antagonistic to the scheme.

The awards have also been a source of discontent. They were certainly distributed with a liberal hand, but I must confess that in my opinion but little discrimination was practiced. Much of the blame is chargable to the Jurors. Many instances can be cited where the Judges displayed little judgment and less perspicuity. As a rule, however, the worthy exhibits were duly honored, and the Committee of Appeals will impartially consider the cases of those who have grievances to redress.

The attendance has averaged nearly one hundred thousand visitors daily, Sundays excepted, and it is a matter of pride to reflect that the success of the Exhibition has mainly depended on Americans, the proportion of foreign visitors being in no wise as numerous as is chronicled at other International Fairs. I am glad to be able to state this fact, as nothing could be stronger evidence of the universal intelligence of our people. They came to see, and, especially the women, saw intelligently. They will have gained data that will enable them hereafter to take a much clearer and more just view of the relative merits of peoples and things. The Exhibition is nothing, in fact, if not educational. Speaking of Education, queer facts are elicited by a careful examination of this subject. The United States compares favorably with most nations and surpasses many, while Russia, which was presumed to be semi-barbaric, makes quite the most systematic and excellent exposition of any of her foreign rivals. The South American governments show creditable work, and almost every country sends specimens of the Art work of their pupils that is highly gratifying.

As a general thing, England and her colonies make the largest and best-regulated display, the colonies excelling in natural productions, while the mother country exhibits furniture, artistic pottery, and works in silver that have no peer. Italy, considering what that country can do and has done at other Exhibitions, makes a meager and disappointing exhibit. Most of the articles in the Main Building are mediocre, and some do not rise to the level of notice. Norway and Sweden have done admirably in all departments, their silver-work and pottery being particularly noteworthy. Russia's exhibit is made under the auspices of the Russian Government, and for variety, excellence of arrangement and beauty, it cannot be too highly praised. I will say nothing concerning Germany. France is represented by a congress of small manufacturers, who came here apparently for the sole purpose of driving bargains. In the entire exhibit there is hardly the name of a representative firm or manufacturer. The Government is not represented at all in the proper sense. The Empire of Brazil does admirably. The exhibit is consistent, and explanatory of the country and its resources. The same cannot be said of China. In the whole display of the Celestials there is absolutely nothing that gives the faintest clue to the manners, customs, scheme of government, public works, education, etc., of this highly conservative nation. Curiously-carved contrivances, and fantastic images and vases, that are marvels of inlaid work, about comprise the exhibit. Their conservatism is further illustrated, perhaps, in the fact that their Minister to this country has purchased, to carry home, presumably, the cream of their offerings.

The U. S. Government has done credit to the country, while the Pavilion of our sisters, mothers and sweethearts, just opposite, would have been admirable if it had figured in a ladies' church fair instead of

CHINESE EXHIBIT, MAIN BUILDING.

an international fair. Our mineral and agricultural resources, and the means of working them, have been splendidly exemplified, while our machinery is justly a matter of pride. It would transcend the limits of a letter and be a repetition of what is already familiar to our readers to give a list of the novel inventions brought together in Machinery Hall. No World's Fair has been so characteristic or deeply impressed with local coloring as has this. It is distinctly and essentially American, and we are proud of it.

Reverting to minor details, it is unfortunately true that the bearing of our petty officials has not been marked with the courtesy that the public had a right to expect. I mean, of course, the foreign public. We are accustomed to impertinence and thieving habits in public functionaries, but the subjects of effete monarchies command politeness from their servants and visit crime with condign punishment. It is alleged, with proofs to substantiate the assertions, that our officers have acted outrageously and purloined from the very places they were detailed to protect. Even the Commissioners have compromised their positions by determining that absolutely no visitors should avail themselves of the Exhibition on Sunday, and allowing favored parties, titled persons, etc., to roam at will through the buildings on these days, by special invitation.

The fun of the Fair has been plentiful and continuous, frequently at the expense of the management, as when a man bought a $2.50 dog, which he entered at the Bench Show merely to gain an exhibitor's pass, entitling him to dead-head privileges, and upon which animal the sapient Judges conferred the honor of *two* medals! But perhaps the funniest incident to some will be the fact that an enterprise which was considered, commercially, a failure will not only pay expenses, but a dividend to stockholders?

Altogether the great American nation has, with its usual liberality, produced the greatest Show upon earth (so far), and the American Eagle can complacently scream for another century, while we go on converting Territories into States and swelling our population until *E Pluribus Unum* itself will have to be stretched into a larger phrase to adequately express our magnitude.

YOUNG RURAL.

DESCRIPTION OF ILLUSTRATIONS.

THE engraving on our first page represents the Chinese section in the Main Building. This nation exhibits, mainly, rare stuffs, curious carvings and grotesque pottery. The principal curiosity is a bedstead that is intricately carved and elaborately embellished.

The tribulations of the Centennial visitor are humorously depicted on page 312. There are those whose experience of Philadelphia lodgings would lead them to assert that the sketch is not overdrawn.

The center page engravings (page 317) are, first, the exhibit of the Argentine Confederation, and second, the Centennial Depot of the Pennsylvania Railroad. The Confederation makes a ghastly display of well-preserved mummies, as well as hides, matting, stone-ware and utensils. The Railroad Depot is noteworthy mainly for the fact that, perhaps, no single depot in the country has accommodated as many passengers, and yet such is the admirable system by which the road is conducted that it is rare for a passenger to board the wrong train.

WESTMINSTER HOTEL,
PHILADELPHIA, NOV. 2, 1876.

THE poultry from England have arrived, and are, in point of numbers, insignificant, but the collection holds within its ranks some birds of rare excellence. The Pigeon Show, in its entirety, is good, as I have already said; but J. H. Cryer of Southport, Eng., has on exhibition some Owls, Barbs, Antwerps and Carriers of wonderful excellence, and which have already been awarded two hundred prizes. The English black-breasted games, though sea-worn and frayed in plumage after their long voyage, are yet most noble in appearance. J. C. Cooper of Limerick, Ireland, makes a fine exhibit.

From Canada the water-fowls please me most. One pair of Camden Geese are actual, snowy beauties, and near them stand a superb pair of Toulouse birds. The Ronen and Aylesbury Ducks are likewise excellent. While on the subject of Ducks, I will say one word regarding the Pekin variety: As an ornamental water-fowl for those who like white ducks on their ponds and rivers, the Pekin Duck is charming. Even when he leaves the water he is pretty, being well-feathered and squarely-built, to the eye; but strip him for the spit and he cannot compare, even for a moment, with his lovely rival from Old England. Canada also exhibits several pairs of Muscovy Ducks. I never could admire them. They are coarse and show the Tartar blood. The White Leghorns from Canada are unusually strong, well-developed birds. All of those shown have double-rose combs, and are, in my opinion, of much value. Among the Asiatics, the Cinnamon, Partridge and black varieties of the Cochin China family are really superb.

I have no more to add by way of commendation, as the remainder of the British and Canadian exhibit is of but ordinary quality and of small proportion. The meagerness of this part of the Exhibition is to be regretted, and numbers of American fanciers who had come from long distances to see and exchange ideas and varieties have been much disappointed. The applications through the British Commission in reference to the Centennial Poultry Show were voluminous, but, unfortunately for the expectants, they have failed to arrive.

M. M.

Dairy Husbandry.

COOKING THE FODDER FOR DAIRY STOCK.

A CORRESPONDENT writes us that he has been advised to adopt the practice of cooking food for his dairy stock the coming winter. He desires to know "if there are any objections that have been urged against the practice, and if so, what they are."

While the cooking of food for stock has been warmly urged by various writers in this country for a number of years past, the practice does not seem to be received with especial favor by farmers, or at least it has not spread to the extent that we should naturally suppose it would if all the advantages claimed for such feeding can be relied upon. What seems most remarkable in connection with this practice is that it has never found general favor in England, where cattle foods are comparatively dear, and where the economy of feeding is made a study by scientific and practical minds. The English feeder prefers to cut his straw and coarse fodder into chaff, mingling with it pulped turnips and allowing the mass to slightly ferment before feeding. It is stated by English authorities that cooked food is liable to induce various diseases in young stock, heifers being attacked with black-leg, black-quarter, speed, etc., while older cattle suffer from splenetic apoplexy, sheep from broxy, and horses from albuminous nephrites, particularly when cooked food has been given. These states of fatal disease arise from the amount absorbed, which constitutes blood poison. It is said "that in no place do we find these conditions so common as where cooked food is given and collateral states of neglect and mismanagement occur." The chief argument against the employment of cooked food as an exclusive diet may be presented as follows:

Thorough mastication of food is recommended and generally admitted as all-important to the well-being of stock. But cooked food rarely calls forth the necessary process, and no amount of cooking will add more nutrition to the food. Mastication is essential for two purposes—to break down the food and saturate it with an important fluid, the saliva, that fluid effecting important changes in the nutritive elements to fit them to undergo subsequent actions by other juices of the digestive organs. It is not possible to supplant these secretions by any process of preparation by cooking or the addition of fluids. Nature has supplied vegetable food for every season, and only requires of man that he should observe the peculiarities of each and give the benefits to animals as far as possible. Again, says one English authority, it is a decided mistake to cook the food of animals when it is sound and sweet. The mistake, so-called, of supplying the dry food in winter is more apparent than real. The exercise of common sense is called for in order to regulate the practice with suitable roots and proper shelter and warmth, more than is usually done.

"Among working horses the effects of cooked food are something marvelous. Colic and indigestion generally, with disease of the liver and kidneys, is of common and fatal occurrence. It may be more easily understood to say that such preparations are quite unnatural, as the digestive organs are constituted to act upon the most nutritive grains. It is also commonly believed that animals, especially horses, pass much away by the bowels that ought to be digested and appropriated to the system. This question requires more philosophical research before it can be definitely and accurately settled; but we can go so far as to say that when the masticatory organs are in good order and digestion perfect, a proper allowance of food is thoroughly assimilated. *Apparently whole grains* may be found in the excrement, but upon close examination they will turn out to be the *shells only*, which, by the action of the digestive juices, have been divested of their internal nutrient parts. Some persons look upon digestion as a process in which everything must be utilized for the building up of tissue. They forget that it is quite as essential that other substances should be present—these non-nutritious in themselves, but by their constitution and presence giving bulk to the rest and assisting in their general reduction in the stomach of the higher animals, exactly as sand and pebbles act in the crops of birds.

"The success of feeding our domestic animals does not lie in the way of cooking food and in the administration of condiments, but in a judicious management generally, in which the peculiar features of organization, physiology, geology, meteorology and hygrometrics play their respective parts; and agricultural success will never be certain until these branches of science are more definitely acknowledged."

These are the arguments urged against the general employment of cooked food for cows, sheep and horses. On the other hand, there can be no doubt that a considerable saving in the expense of fodder can be effected at times in making up a ration of straw and ground grain, and cooking the same to render it soft and palatable. In cooking food for stock, the cost of apparatus, fuel and labor must be taken into account, and when hay and grain are cheap, the saving from cooking does not meet the extra expense of preparing the food. The question is one which has been before the public for a long time, and much has been written upon it—more, perhaps, in its favor than against. The fact, however, that many persons who have tried cooking food for dairy stock have soon abandoned the practice and returned to the old method is significant. Hence we should advise a limited trial at first, always keeping a record of the exact cost and comparing it with the expense of uncooked food.

It may be proper to state in conclusion, that in our observation of herds wintered on cooked food the animals appeared to be healthy and there was entire freedom from the diseases to which allusion has been made. The cooked food, however, was used for comparatively short periods. What the effect might be from a long-continued use of such food, we are not able to say.

MILK AS AN ABSORBENT.

ACCORDING to the extensive investigations of Dr. BATLARD, contagious germs resist an undetermined amount of heat. The hot water of the laundry has not prevented the propagation of scarlet-fever poison from infected clothes to those from healthy sources: these, on being returned to their owners, have propagated the malady. It will be seen, then, how important it is that dairy utensils be cleansed with water known to be pure and free from any corrupting influence of sewage or filthy surroundings. As cold weather approaches, a practice, quite too common in the country, occurs of setting milk for cream in the kitchen pantry; indeed, not unfrequently, we have seen it placed on temporary racks directly in the kitchen, where all the steam from cooking, as well as the breath and emanations of those living in the room, are absorbed by the milk. This state of things we have observed more especially in cheese-making districts, where, from the habit of sending milk to the factory, there is no proper place provided for setting it in the fall for butter making. And many are not aware that any harm comes from such practice, and it is to such that these remarks are addressed.

In regard to the absorptive properties of milk a very interesting statement ir given by Mr. LAWSON TAIT, F. R. S., of Birmingham, Eng., the leading points of which we present. Being engaged with others in examining the conditions attending the spread of the foot and mouth disease at the farm attached to the West-Riding Lunatic Asylum, under the superintendence of the distinguished Dr. CRICHTON BROWNE, a test was made, among other experiments, of diseased milk. It was found to have a particularly disagreeable, smoky taste, which was at first attributed to the disease of the cows. It was found, however, that the smoky taste was not confined to the milk yielded by the affected animals, and Dr. BROWNE, on being questioned, affirmed that he had sometimes had occasion to send away milk and cream from his table which was unfit for use on account of its smoky taste. A little further examination showed that this flavoring was due to the recent asphalting which had been done near the milk-house. It occurred then to Mr. TAIT that if milk acquired this tarry flavor from the absorption of the exhalations of asphalting, it was just possible it might also acquire other things which were not so innocuous, and experiments were made which led to the belief that milk, when brought into contact with diseased persons, may become an extremely dangerous agent for the spread of disease.

Again, by inclosing fresh milk under bell-jars with tar, turpentine, assafœtida, fæces, urine, etc., it was found that in most instances the milk became impregnated with the smell, and sometimes with that intensely disagreeable sensation which we know as the "taste like the smell" of the substance employed. The degree to which this was acquired seemed to be not so much in proportion to the amount either of milk or of infectant substances employed, as to the amount and quality of the cream which rose to the surface of the milk, the oleagenous molecules seeming to act as the menstruum of contagion. This is not unlikely, when we remember that the best solvent for nearly all odoriferous principles is oil.

This statement of Mr. TAIT is corroborated by facts coming under our own experience and observation; and we deem it important at this time to call the attention of dairymen to the subject, because we know there are many who are in the habit, during cool weather, of setting milk in the living room or in apartments contiguous thereto, which receive the odors and emanations of the kitchen. And this practice becomes much more reprehensible in cases where sickness occurs in the family. Sickness among children is by no means uncommon, and we are quite sure that if the absorptive qualities of milk were better understood and appreciated, the practice to which we have referred would not be so prevalent. That contagious diseases are thus spread we have no doubt, and it is incumbent upon dairymen to take every precaution possible to keep milk out of the reach of disagreeable odors, or of anything by which it may be contaminated.

A DAIRYMAN'S VIEW OE THE BUTTER MARKET.

THE American Grocer evidently is not an "Inflationist," nor a believer in persistently holding on to an article for the purpose of forcing up the market price, judging from the following criticism of a dairyman's letter to his "home paper:"

"A misguided Granger writes to the Utica Herald from New York, where he was stopping temporarily on his way to Philadelphia, that 'the past season has been a very trying one to dairymen, owing to the low prices realized for their products; and as the weather has been unfavorable, giving an excuse to buyers to depress prices and reclaim for unmerchantable goods, we have worked almost for nothing, as in most instances deductions have been unwarrantably claimed. But the heat is now over, and as the season has been unusually dry and the make not much more than half the usual quantity, as also all farmers are aware, I would like to know why we should not have full value for our product. For the purpose of examining the prospects, on my way to Philadelphia, I am stopping in New York, and find the advance we all have reason to expect checked by artificial means. The same power that works to reduce prices in midsummer is now used to keep farmers from realizing a fair compensation.

"'While butter retains its natural advance, cheese, controlled and managed by a few men, not only is reported dull, but is quoted lower here, and this, as I have reason to believe, through artificial means. It is also reported lower in Europe. We should have fair compensation for services, and in order to have it we must be controlled by the natural laws of supply and demand, without submitting to the dictates of combinations of men. We now have in the country a quality superior to any that has gone forward, therefore we should have an advance in proportion, and the stock on hand should be far more valuable than what has been taken from us by buyers, which they told us, when buying, was mere trash.

"'I understand that parties have come here from Europe and, on account of the drought there, invested largely in dairy products, and are now realizing large profits therefrom. I would ask in conclusion that when, as now, artificial means are used to depress the market for the purpose of gathering in our stock on hand, would it not be well for all dairymen to stand firm and not dispose of stock? They are able to hold until a fair compensation offers. There is no risk with one-half of the usual stock and prices comparatively low.'

"To our city readers," says the Grocer, "who are familiar with the course of this market for dairy products, the above will read like a joke. The dairymen will find that the New York market is governed by the laws of supply and demand, and all the merchants in the city, combined, are not strong enough to either keep goods down or put them up when the relations of supply and demand influence the market otherwise. If the writer of the above letter had possessed sufficient discernment to detect a hole in a ladder, he would have discovered that the New York market was far from being strong on its merits, and if he has not already seen it, he will be pretty certain to learn before next spring that the worst mistake the dairymen can make this season will be to 'stand firm and not dispose of stock.' He may think there is no risk at the present 'low prices,' and the results of his reasoning may prove satisfactory to the interests he represents. But the dealers in butter will find it more profitable to pursue a conservative policy and allow the dairyman to hold his stock until he is perfectly satisfied to let it go."

SWISS METHOD OF MAKING WHEY BUTTER.

SOME of the Swiss cheese-makers in this country who are employed at our factories manufacture Whey Butter as follows:

The whey is drawn directly from the curds into a zinc vat, or into a vat having a metal bottom. This vat is 15 inches high, 3 feet wide, and of convenient length. It is set in a wooden vat, with space between the two for cold water. When the whey is drawn in the upper vat, a handful of salt is added to every 10 gallons of whey. During the first two hours the mass is thoroughly stirred from the bottom every 15 minutes; it is then left to stand quiet for about 24 hours, when it is skimmed. The cream is

churned at a temperature of about 58°, and care is taken to have the temperature at as near this point as possible. It is churned until the butter forms in granules about the size of buckwheat kernels, when it is left at rest for about 5 minutes; then the buttermilk is turned off and cold water poured into the churn. The butter should become hard before stirring much; then rinse with cold water until it runs off clear.

The butter is now gathered together, the water poured out, and salt added at the rate of one pound of salt for every 18 pounds of butter. It is now set aside in a cool place until next day, when it is worked and packed in the same way as other butter.

We have seen very nice Whey Butter made in this manner, and when fresh it is quite palatable and fully equal to the best grades of Cream Butter. Whey Butter, of course, can never be expected to have the fine aroma and smooth taste of the finest grades of Cream Butter, but when well made, it passes current for ordinary Cream Butter. It should be consumed while fresh, as it does not keep so well as butter from cream.

FALL-MAKE OF DAIRY PRODUCTS.

The fall-make of Butter and Cheese throughout the central counties of New York is likely to be very much less than the average of former years. The severe drought and its long continuance not only cut off feed in pastures, but it seriously affected the growth of the after-feed of meadows, which is largely relied upon by dairymen for keeping up the flow of milk during the fall season.

We have reports from dairymen in several counties, and they all speak of the unusually low yield of milk through September and October. The recent heavy frosts have, of course, injured what little grass remains, and we cannot hope for either a large quantity or the best quality of dairy grass from this time out. As was remarked by a leading dairyman of Herkimer Co., yesterday, Oct, 23:—"The dairy season is about over and we are now getting only the driblets, which should commence fully a month later." It is a question now with dairymen as to how much the short crop will affect prices. The September and October cheese is admitted to be of very fine quality, and the impression prevails among the factories generally that it will fully command 14 cents and upward before navigation closes.

The Poultry Yard.

CAN A POULTRY FARM PAY?

A correspondent of the London Journal of Horticulture gives us his opinion in regard to the above subject which may interest some of the many poultry raisers who read the Rural New Yorker:

"This question has been fully answered in the affirmative by our neighbors the French. Hitherto with us the attempts have ended more or less in failure; but is that a reason, if a proper method is adopted and due care and supervision exercised, that we should not succeed in the future? From the accounts I have before me of the French poultry farms I gather that if we follow their example and breed for sale, just as ordinary farmers do their sheep and oxen, there is no apparent reason why a fairly remunerative profit should not be realized by poultry farmers in this country. My belief is that all attempts hitherto in Great Britain have been undertaken and carried out on a fallacious basis. The mania for prize-winning and fancy exhibiting has helped to bar success. Again, too expensive and elaborate buildings, &c., have been another cause of failure. Look to some of our most successful breeders: ordinary wooden houses have been enough for them, and their birds have everywhere gained commendation. Let, therefore, economy and real, not elaborate, efficiency be our aim.

1st, Let there be plenty of space in the open runs. The poultry will find for themselves much good and wholesome natural food, and so save extra feeding. 2nd, Let the home feeding be regular and liberal, but not excessive: your birds then will always be in good health and condition. 3rd, Whether you purpose producing eggs or meat for the table, choose suitable breeds for each object. Do not, however, use too many different breeds, as that involves complications in your houses, yards, and accommodation generally. 4th, Let your personal supervision be constant, and employ only the best and most trustworthy assistants.

I have lately read with pleasure, in Mr. L. Wright's book on poultry, of the Bellair (French) farm, that if intending poultry farmers here took this as their model, and only improved upon it so far as their own experience and that of celebrated poultry breeders suggested, they would soon have a sound system to work on and success be assured.

To take another line of argument. A farm, say, of fifteen or twenty acres, will only support a certain number of sheep or oxen according to its fertility of soil; all other feeding stuff, oil cake, &c., will have to be paid for extra, and that in high proportion. Calculate out the product of this in beef and mutton for the market. So many oxen or sheep of such and such weight can be raised, but what can we say of poultry? In this case so much does not depend on the quality and richness of soil; and a greater weight of poultry at less cost, as I purpose showing in my next article, will be raised than could be of beef or mutton.

Poultry, it is true, are liable to disease, so are sheep and oxen. With twenty acres, too, if properly managed nearly every requisite might be raised for the stock kept. Could this be done in ordinary farming? Byres, cattle-steading, granaries, would in the case of an ordinary farm be on a much larger and more expensive scale than need be for a poultry farm.

There is only one question that seems to me of vital importance now left for consideration—Is there a good and conveniently situated market for your poultry, easy of access, and where fair wholesale prices can be obtained? If so, I can see no reason to doubt success.

I have for the last eight or ten years raised poultry in a large way for my own consumption (selling only at times the surplus), frequently having three or four hundred birds young and old in my yards, and averaging over five thousand eggs per annum, with always a fair supply during winter from young pullets. The direct gain in money was comparatively small, inasmuch as my runs were contracted, so entailing extra feeding, and little produce went to market, and that not of the best description; but indirectly my butcher's book was greatly relieved, and I always had a pleasant variety of food for the table. I bred Houdans, Brahmas, Chinese and common Geese, Peruvian and common Ducks.

As to the question of breeding for actual profit, I have not hitherto tried it; but so convinced am I from my past experience as an amateur that it will or should pay that I intend shortly, in conjunction with a friend of mine, to undertake poultry farming on a fairly large scale, beginning moderately at first, and eventually, if successful, extending our sphere of action.

So far I have given you and your readers my ideas and experience, hoping that others will take up this question and give us the benefit of their advice: in any case they must look upon the question in the proper light—viz., profit and loss.

AMOUNT OF FOOD A FOWL WILL CONSUME.

V. S. Hoboken says: "I have seen in the Rural a statement to the effect that the several varieties of fowls consume the same amount of food. As I am a beginner in keeping fowls this is a matter of importance to me. Please answer the following questions: 1st. Will it cost me only as much grain to feed one of the smaller breeds, as it will to keep a Brahma? 2d. Which variety of non-sitters do you consider best? 3d. Which variety would you advise me to keep in my "city" yard?"

Answer. The statement in the Rural to which V. S. refers was that of a correspondent, and he will see by reference to the article that we did not agree with the gentleman's views. It is a question that can be accurately answered, and we have now on our desk a letter giving at length some practical views on the subject. Pressure of matter keeps it out of our columns for the present. Meanwhile, we answer his questions in a general way. 1st. Hamburgs, Leghorns, and other "smaller" varieties eat *much less* than Brahmas. 3d. The Asiatics, Brahmas or Cochins bear confinement well, and for V. S. we suggest that he keep a half dozen Brahma hens and a cock, together with a trio of Game Bantams. The latter will always thrive with larger fowls, being active and keeping out of their way, picking up the "leavings," and not cross-breeding with their big neighbors.

If V. S. is "setting up an egg basket" in a small way, he can try a dozen Leghorns or Hamburgs instead of Brahmas, but he must bear in mind that they must be kept scrupulously clean in so small a place. But if he merely wishes the pleasure of feeding a few good looking fowls in his back yard, and trying the temper of his laundress by having a few birds walk over "the week's wash" every Monday, we think Brahmas will answer his purpose as well as any other.

In fact the great cry raised against Brahmas is, that they are enormous eaters—even making allowance for the return of eggs and meat. 2d. Both Hamburgs and Leghorns are famous layers and non-sitters. The Leghorns mature earlier than the Hamburgs, but the Hamburgs outlay the Leghorns, both in the number of eggs and in the total weight of the year's laying.

T. W. W.

Sheep Husbandry.

MORE SHEEP WANTED.

From almost every quarter of the country we hear complaints of sheep being unprofitable at the present prices of wool and mutton. In several instances we have noticed articles going the rounds of the press headed. "What shall we do with our sheep" and other similar titles which are likely to cause those engaged in sheep husbandry to be alarmed at the future prospects of their very important industry.

Now, it is an old saying that "straws show which way the wind blows," and we think there are some straws connected with the wool interest which may be watched in order that the farmer may see whether it is advisable for him to kill off, or keep his flocks. Wool is a staple article always in demand, and for which a certain amount of money can be obtained, and the only question for our farmers to decide is whether they can produce it with profit, not by basing their calculations upon the lowest price, but upon the average for a series of years. As the prices of all staple articles are liable to fluctuations the only safe guide in their production is to base all calculations of profit upon averages, and in doing this with wool we think there are very good and substantial reasons to be hopeful for the future. One straw which points to a hopeful future is the fact that we have not as yet been able to produce all the wool required for our own use in this country.

Last year we paid foreign countries some $50,000,000 for woolen goods, and about $11,000,000 for wool, and to make up this deficiency we need some twenty million more sheep. If our farmers complain of the low price of wool, what can they say of it in countries whence the deficiency in our own markets is made up. Cannot we produce wool as cheap as the foreign producer can land it in our markets, with all the extra expense to which he is compelled to submit before placing it in competition with the home raised article? If not, why not? We have as cheap lands as any nation, and as good a climate for sheep husbandry as can be found on the globe, consequently, there must be something wrong either in the breeds, or management of flocks, which makes wool-growing unprofitable, if it is really so, as frequently asserted.

But we are inclined to believe that sheep husbandry is as profitable as any other branch of agriculture, and although there may be some "bad years" still upon the whole, raising wool and mutton will yield as large returns for the capital and labor invested as the production of beef, pork, or any of the ordinary farm crops.

Raising wool is not so exhaustive to land as the raising of grain, and the difference should always be placed to the credit of the wool crop, which, it is to be feared, many of our farmers fail to do in making up their accounts. The balance sheet, if it shows only the cash part of a farmer's operation with sheep, and especially if it does not extend over a period of more than one or two years, will not give a fair exhibit of either profit or loss, for fields may have been enriched to such an extent that they will give a large increase in the yield of grain, grass, or other crops for several years after the sheep have been removed.

Taking this favorable view of the subject we would not advise farmers to sell or otherwise dispose of their flocks, but endeavor to improve and increase the number. It may be necessary in some instances to find a more economical method of keeping and feeding, but this can readily be done by studying the systems practiced by the most successful breeders in this and other countries.

THE BEST SHEEP FOR THE FARMERS.

The Kentucky Live Stock Record in speaking of the best breed of sheep for farmers says:

The best sheep for a farmer to keep are those that yield the heaviest fleeces and the greatest number of pounds of meat. The scrub sheep will yield from three to six pounds of wool per head, while Merinos will range between ten and twenty pounds, and thoroughbred Cotswolds more. Why is it that farmers do not raise the sheep which will give these heavy fleeces? Then as to meat, the fine sheep produce an enormous amount of flesh, and do not eat any more than a scrub. But besides these facts, the fine sheep do not only yield larger fleeces per head, but the wool is of superior quality. The same is true of the flesh of fine sheep in comparison with scrubs.

Southdowns, for instance, are the finest mutton in the world, always commanding an extra price—a flesh which princes desire—while the fleece is medium. The Shropshires stand next in meat quality, and are next to Cotswolds in fleeces. The profits of these breeds are very great in times of ordinary prosperity, and under all circumstances it is best for the farmer to breed them, because they pay better—the grand result which is the supreme object of the farmer—the highest possible remuneration for his capital and labor.

And all this concerning sheep is true of fine breeds of cattle, horses, hogs and poultry. In the face of these indisputable facts the mass of the people should not handle scrub stock, and entertain an ignorant opposition to fine breeds. There is one supreme reason for this. The mass of people do not read papers devoted to live-stock interests, and are wholly ignorant of the vast progress that is being made by the more intelligent ranks of farmers. There are sections of Kentucky where the improved breeds of stock are almost unknown. It is only a small number of men who are alive to it, and keep themselves, thoroughly posted in regard to the progress of agricultural science and the breeding of the best animals, while the masses remain in the old ruts, following after the customs of a hundred years ago. If farmers would elevate their calling and render it more remunerative, they must put themselves in living connection with the intellectual spirit of the age.

The Herdsman.

ANIMALS KILLED BY EATING WHEAT EARS.

The recent damp, rainy weather has in various ways interfered with the health and thriving of the live stock of the farm. The soft, rapidly-grown, succulent grass and other green fodder has not now so much nutriment as could be desired, says the North British Agriculturist, and unless supplemented with nutritive dry food cannot generally produce either growth or fat. As the nights get long and cold, and the lodgings bad, the deficient nourishment of the grass becomes more noticeable, and young cattle or sheep kept upon the pastures, by-and-by suffer from anæmia or bloodlessness, get pot-bellied, and die from diarrhœa or from some form of dropsical disease, which in many parts of the country is aptly enough called "the water." But the wet, rank grasses, unless cautiously used, induce more direct and immediate gastric derangement, especially hoven, colic, and diarrhœa. Cattle and sheep turned on luxuriant clovers when wet contribute large numbers of hoven cases, while such damp, fomentescible food increases the list of those attacks of inflamed bowels and weed now prevailing among indifferently managed farm houses. Last week we noticed the frequency of abortion in cattle—the result of the grasses becoming ergoted by the continued moisture of the past six weeks, while similar conditions probably account for cases of red water which are reported to occur in various parts of the country.

The stock on many arable lands have also suffered from the dripping autumn. Considerable sickness and some mortality—all perfectly preventible—have in many quarters resulted from animals being thoughtlessly turned on to the wet stubbles, and greedily eating the damp swollen ears, especially of wheat. Some horses and many colts treated to a run on the stubbles, which the rains have often prevented being raked as carefully as usual, have been attacked with colic, and where wheat has been partaken of, large numbers have suffered from laminitis. Cattle and sheep turned on to stubbles, and gorging themselves with the sodden wheat ears have become tympanitic, colicked, and have sometimes died within twenty-four hours.

Here is a typical case of the mischief effected among a choice flock of 120 ewes indulged in a few hours' run over an unraked and ungleaned wheat stubble. On a damp morning, about eight, the ewes were allowed to roam the stubble; about three in the afternoon they were returned to the old pasture from which they had been removed in the morning. Nothing amiss was observable that evening; but next morning about half the ewes were restless, pained, pawing and scratching with their forefeet, rumination suspended, the belly overful, the bowels confined, some straining considerably. Tympanitus and dullness increased, and five sheep died shortly after noon, and about twenty hours after being placed in the fatal stubble. For another day fresh cases, although of a milder character, continued to occur, and half a dozen of the first patients died. In the sheep opened, the rumen was distended with the swollen heads of wheat, which were only slightly softened or changed. Very little either of the grain, chaff, or straw had got beyond the first stomach. In two cases the cuticular coat of the stomach was readily peeled off and disclosed underneath patches of congestion; but excepting these patches, which were not noticed in all cases, no congestion or inflammation was discovered in the digestive canal, and all the other organs were healthy.

The treatment adopted consisted in placing the affected animals in a yard where they had no solid food, allowing them as much boiled linseed gruel as they would take, giving 5 or 6 ounces of linseed oil, mixed with gruel, and administered in gruel or beer every two hours, about a dram each of ammonia, carbonate and spirit. This stimulant treatment appears to have given relief, and had it been adopted earlier might have saved some of the eleven sheep lost. In all such cases it is unwise to give large or reiterated doses of purgative medicine; one or about two doses of mixed linseed and castor oil are much safer and equally effectual; solid food should be interdicted until rumination is established and the bowels regularly opened. Soft, sloppy messes assist the action of the oils, while frequent small doses of stimulants brace up the digestive organs to their work of getting rid of the indigestible matters.

These cases should warn agriculturists against turning their stock on the stubbles, particularly if there is much grain left, or it has got wet and growing. Especial caution is requisite when first the animals are turned out, as they are ap more greedily to devour the unaccustomed food

The Garden.

THE GREEN PROLIFIC CUCUMBER.

We did and do ridicule the assumption that the Green Prolific Cucumber, fifty years ago, was produced from a cross between the Green Cluster and Long Green, the progeny of which was again crossed with the White Spine. Who knows this? If Dr. Hexamer knows it, we will accept his statement to that effect and hasten to withdraw, any slight we may have cast upon its origin. Mere surmises, however, as to an origin so definite and complicated are in our humble opinion deserving only of ridicule.

"Why anyone should try to ridicule the introduction of a new Cucumber any more than that of the Trophy Tomato or Snowflake Potato is not apparent."

We did not "try to ridicule" anything of the kind. There is no part of the article referred to that justifies this remark. We do not purchase seeds of novelties, furnish the land and labor necessary to plant and cultivate them with any other object than that of ascertaining their merits or demerits. That high prices should be asked for meritorious novelties is right. It is a partial reward to him who has, at infinite pains and years of toil, it may be, produced them. But that high prices should be paid by many for all the worthless novelties that are advertised in superlative terms, is wrong, and if a single individual or corporation will take it upon himself or itself to test their real worth and to render impartial reports, the community is benefited; and it is this benefit that it is our aim to work wherever and in so far as the Rural's influence extends.

"But it is certainly not the province of a journalist to run down a new thing after one careless and imperfect experiment." There was but "one" experiment with the Green Prolific;—we said *that* in our article. But we did not say that it was "careless and imperfect." How did Dr. Hexamer find that out? All are not possessed of his well known skill in the cultivation of Cucumbers and other garden vegetables; few are interested to the same extent. But if not possessed of all his skill, are one's experiments necessarily "careless and imperfect?" Suppose that he cultivated a given plant in his own grounds with all the care that an easily cultivated plant might require. Would he feel justified in drawing *any* conclusions therefrom? If so, would he hesitate to state those conclusions suitably qualified? This is our case. We cultivated the Green Prolific with more care, we think it may be said, than is usually bestowed upon Cucumbers and we recorded the results of the trial as they appeared to us, without knowing or caring who were specially interested in the Green Prolific any more than in the Khiva or Russian Netted, Tailby's Hybrid or Swan's Neck, all of which were alluded to in the same article.

"It is certainly not the province of a journalist to run down a new thing after one careless and imperfect experiment. We grant it. Nor is it the province of any fair-minded person to assume that, because the results of others' experiments accord not with his views, the experiments were "careless and imperfect."

Finally, let us say that we find, since writing the article upon Cucumbers, above referred to, that the Green Prolific therein spoken of is, in the estimation of many who have tried it, all that Dr. Hexamer claims for it. As the grounds of the R. N. Y. are not so extensive as to include every variety of soil and climate, the failure or success of any particular plant should not be considered as evidence for or against it, except for localities similarly conditioned. The specimens of Cucumbers sent by Dr. Hexamer were so badly smashed that we could tell nothing about them.

DIOSCOREA BATATA.

I read in the Rural New Yorker, Aug. 5, 1876 an article on the *Dioscorea Batatas* or Chinese Yam. It is true that at first the difficulty of gathering the roots (growing so deep in the earth), gave to this plant very little interest as an agricultural plant, or as we say in France "*Le grande Culture.*"

But allow me to add to the article of your honorable correspondent that "at The Jardin d'acclimation near Alger (Algerie), after several years of culture, the Chinese Yam produced many varieties with roots or tubers perfectly round.

So the first objection may not exist now, and I believe this plant worthy of the attention of farmers in America for new experiments.

If you judge these lines interesting to your readers you can publish them, not as a rectification to the article of the 5th of August, but as throwing additional light in regard to the *Dioscorea Batatas.* Emanuel Harcy,
(Late Student at the Jardin des Plantes of Paris).

We have heard of these globose tubered Dioscorea for the past ten years but up to the present time have not been able to procure one. If our correspondent can put us in the way of obtaining even a single tuber, he will do ourselves and readers a great favor.—Ed. Rural.

A note in the London Garden says that a gentleman in Bolbec, in France, has raised a black Spanish Radish, which measures three feet long without the leaves.

CENTENNIAL ACCOMMODATIONS.

The Vineyard.

CALIFORNIA GRAPES AND RAISINS.

A reporter for the San Francisco Call has been making visits to some of the best vineyards of the State, and from his account we condense the following, as it gives some interesting information in regard to the value of the foreign varieties of grapes in California.

UVA LARGA.

All the authorities agree that the best raisin grapes belong to the Muscatel family, which includes a considerable number of varieties, all resembling more or less the Muscat of Alexandria. A variety of this group, utilized quite extensively for raisin-making in Spain, is the Uva Larga, which was brought to this State, we believe, by Mr. W. A. Sanders, who considers it the best raisin grape. It is a long, white variety, of which Busby writes as follows: "This variety is also employed at Malaga and its environs in making raisins. It is called Larga from its long shape, the berries being 10 lines in length and only 6½ in thickness It is a free bearer, and is said to make a good mixture with the Pedro Ximenes for wine." In another place the same author, writing of the vineyards in the vicinity of Malaga, says: "There are three distinct sorts of raisins. First, the Muscatel, which are the finest, and are always packed in boxes of 25 pounds, and half and quarter boxes, containing respectively the half and quarter of that quantity. Second, the Bloom raisins. These are prepared in a manner in every respect similar to the Muscatel, but from a different grape—a very long grape, called in the country Uva Larga. These are also generally packed in boxes, but sometimes in casks. Those in boxes are also called 'bunch raisins;' the others are generally of an inferior quality, and separate from the stalks. Third, the Lexia raisins, which are packed in casks or grass mats called 'frails.' These raisins are of an inferior kind, and require to be dipped in lye (lexia) of wood ashes before drying." In order to illustrate the difference in the quality of the three kinds, he gives the prices at which they are sold: "When Muscatels are 40 reals or $2 a box of 25 pounds, Blooms are about 30 reals, and Lexias only from 24 to 28 reals per quintal of 100 pounds." He adds, in regard to the Muscatel Gordo Blanco, that it does not succeed in the interior, and, therefore, that all the Muscatel raisins are made within from two to four leagues of the coast. The Lexia raisins, which are used for puddings, etc., are made in the interior.

MALAGA RAISIN.

Mr. West, in an article published in the Fresno Expositor, says: "This variety has proved to be an excellent bearer, very sure to produce a crop. It is a sweet, pulpy grape, of not very decided flavor. The raisins will not equal the Muscatels in flavor, but are very good. They can be produced at my place at a much less price than the former."

MUSCAT OF ALEXANDRIA.

This is undoubtedly the most extensively cultivated raisin grape in the State, at the present time, and in an enumeration of varieties, therefore, it deserves more than a passing notice. The grape is too well known to require description. It is of good size, pulpy, and makes a good-flavored raisin. The objections urged against it are its large seeds and thick skin, making it long in curing, and also its liability to blight in setting. Mr. West says it is a poor bearer with him, giving but four tons to the acre, while in locations better suited to it, the yield is double that quantity. Mr. Busby says of it in France, where it is known in some localities as Panse Musquee: "It is seldom preserved for raisins in Provence, as they find it difficult to dry, owing to the thickness of its skin. Negrel Ferand says, that though less cultivated than the common Panse, it is more worthy of attention, only that it frequently blights in flowering. The remedy which he suggests for this is to prune it long. He adds, that if cultivated with care, its raisins would rival the best of Malaga; but it is questionable whether the degree of heat at Roquevaire is sufficient to dry it perfectly. The acreage in the State devoted to the Muscat of Alexandria is quite extensive, and this will, for some years to come, be the principal raisin grape. It succeeds well in many localities, and with careful culture and pruning on rich soil, grows sufficiently large to make a good raisin. It shrinks less than most varieties in cultivation here, requiring, according to different localities, from two to three pounds of grapes to one of raisins, the latter being the more common estimate.

CANNON HALL MUSCAT.

This is another grape, closely allied to the above, that has been used to some extent in this State for the production of raisins. It is a more vigorous grower, has larger berries, and is preferred by several growers to the Muscat of Alexandria. M. R. Miller, of Pleasant Valley, Solano County, last season shipped several tons of good raisins to this market made from this grape.

WHITE MALAGA.

This is a grape that is, in some respects, well fitted for raisin making. It is of good size, and the seeds are small and few in number. Mr. West writes of it as follows: "The White Malaga is a large, loose-growing grape, wonderfully productive, and makes a fair raisin. I am informed by a reliable person that he has grown ten tons of this grape per acre." G. W. Swezy, of Marysville, cultivates it quite extensively, and, the last season, shipped to this market several tons of very good raisins made from it.

SULTANA OR SEEDLESS.

This raisin is imported into the country in considerable quantities from Turkey. It is the product of a small, white, seedless and very sweet grape that has for several years been cultivated to a limited extent in this State. It is grown to perfection on the grounds of Mr. West, at Stockton, and of Dr. Strentzel, near Martinez. The article in the Fresno Expositor says: "The Sultana or seedless is a good bearer, although not so abundant as the White Malaga. It is small and dries very quickly." It ripens early, and it dries so readily that it is well adapted for cultivation in the cooler counties, like Sonoma and Napa, where most grapes are rather late in ripening. Raisins have been made from it in this State fully equal to the best imported.

ZANTE CURRANT OR CORINTH.

The Zante currant is an important commodity in the grocery trade of the country, and should be produced in California in sufficient quantity to meet the requirements of the whole Union. The principal supply comes from Zante, Cephalonia and other Ionian islands, and the Morea, though a small quantity is produced in Spain. There are two varieties of grapes from which the currants are made, namely, the White and Black Corinth, both of which thrive in most parts of the State. A sample prepared from the former by Mr. West was submitted to one of the leading grocers of this city, who was so struck with the superiority of the fruit that he unhesitatingly offered 12½ cents per pound for a large quantity, though imported currants were selling at the same time for eight and nine cents per pound. Mr. West writes as follows of this variety: "It is always cheap, but it can be grown at quite low rates. If some one would produce them in large quantities, and use anything like care in curing them, a much better price could be obtained. No housekeeper or baker would use the dirty, gritty, sour, partially rotten products sold as currants after seeing a clean, well-cured article. There would be but few currants used if the housekeeper could see, as I have, the

dirty place upon which they are dried, and the beings who handle them."

SHIPMENTS OF INFERIOR FRUIT.

It is a matter of regret that a large portion of the California raisins sent to the Eastern markets last year were of inferior quality, chiefly from being made of unsuitable grapes, thereby, it is feared, injuring the sale of future shipments. It is of the utmost importance that in the infancy of the industry none but the best should be sent out of the State, unless it is distinctly understood that the fruit in question is of the second quality, or cooking raisins, and is sold as such; and that the boxes should be plainly marked, so as to unerringly indicate the quality of the contents. There are doubtless many grapes growing in the State from which good raisins can be made, and it may be that some of the best Spanish varieties were brought here by Col. Haraszthy in 1861, and are now extensively cultivated under other names. Certain it is that some of our raisin producers, notably, R. R Blowers of Yolo and G. G. Briggs of Solano County, have superior varieties. Shipments of this year's crop, just received from these two producers, are of so excellent a quality as to leave little more to be desired. Those from Mr. Blowers, on account of the care and taste displayed in packing, have elicited general commendation, while many have expressed surprise that California is capable of producing such fruit.

THE PHYLLOXERA IN MADEIRA.

According to a letter from Dr. Grabham, an English physician residing in Funchal, which appeared in the "Times" of the 25th ult., the Phylloxera is committing sad havoc among the Madeira vines. Dr. Grabham states that the growers who re-planted their vineyards after their former destruction by blight, have enjoyed but a brief time of prosperity, for the Phylloxera is spreading general and utter destruction. In the best situations peasants are already burning in heaps the trellis-work of their lately beautiful cultivation, and in less valuable districts the devastating process is only one stage less advanced. Around Funchal there is not one vineyard in vigorous condition, and it is clear that no considerable crop of good wine may be looked for. In the "Times" of the 26th ult., Messrs. Cossart, Gordon & Co., Madeira wine importers of long standing, gave a much more hopeful view of the affair. They state that although the Phylloxera has done some mischief to the vines this year, they are informed by their house in Funchal, writing on Sept. 15th, that the quality of this year's vintage is excellent, so far as can be judged by the saccharometer, and that the quantity will be very large in proportion to the shipments, although less than last year's produce. This year's vintage is estimated at 10,000 pipes, being within a fraction of the exact average of the last seven years. The Phylloxera seems not only to destroy the vines, but like the Laurel branch on board the good ship Argo, it seems also to give rise to interminable disputes among those who speak or write about it.

MADRESFIELD COURT MUSCAT GRAPE.

This grape appears, says a correspondent to the London Garden, to be a very uncertain variety; it was said to be a late grape, but as such it has failed in many places to give satisfaction. I am, however, of opinion that soil has a great deal to do with its success or failure, other things being equal. The best sample of it which I have yet seen is in a late vinery at Bolton Hall, near Bedale, where one rod is carrying sixteen bunches of fine fruit, in which there are no signs of cracking, which is its usual fault. Mr. Roberts, the gardener at Bolton, tells me that it invariably succeeds well with him, better even than other vines in the same house, consisting of Lady Downes, Alicante, and Barbarossa. The border in which it is growing is all inside, and is made up of loam off the carboniferous limestone, bones, brick rubbish, and a good sprinkling of charred garden refuse.

Pomological.

RIPENING PEARS.

Many a bushel of late fall and winter pears are spoiled for want of care in ripening. It is well known that pears generally are of much better quality if properly ripened in the house or cellar than when left to fully mature on the tree. But there is more danger of late sorts being injured by placing them under unfavorable conditions than the early sorts, consequently we offer a few hints which may be of service to those who have had no experience in this matter.

Late fall or winter sorts which do not mature until frosts occur, should be gathered before being in the least frozen although there need be no haste upon the first appearance of cool nights. In gathering, pick every specimen by hand or in some manner to avoid bruising, for the pear will not withstand such rough handling as the apple. Pack in small boxes, barrels or half barrels, leaving the cover or head off for a few days or until all surface moisture has passed away, then close up tight. The vessels containing the fruit should either be left out in the open air until there is danger of freezing, or stored in a cool dry room, for haste in ripening is not conducive to fine flavor.

Where one has only a few pears raised for family use, common wooden cheese boxes will be found very handy for packing as they are more easily handled, than larger vessels, which is quite important when they have to be moved and the fruit examined several times during the period of ripening. If each specimen is wrapped in soft paper it will in a measure prevent bruising and rotting, but we do not think it of sufficient benefit to pay for the trouble when keeping pears for home use.

The fruit will need to be examined every week or two and any decaying specimens removed, but so soon as the pears show the usual signs of approaching maturity, or are becoming soft and in condition for use, the boxes or box, as the case may be, containing the ripening sort should be brought out of the cool room or cellar and placed in a warmer atmosphere, say where the temperature is from 75° to 80° Fah. Pears taken from a cool room and placed in a very warm one for a few days during the finishing stages of the ripening process are wonderfully improved especially in the increase of their saccharine properties. The effect is probably more marked on the very late sorts like *Vicar of Winkfield, Easter Beurre* and *Winter Nelis* than on the autumn sorts.

The novice in pear culture should also bear in mind that pears part with their moisture much more readily than apples on account of their porous skin, consequently it becomes necessary to keep them in a somewhat confined atmosphere else they soon shrivel up and either decay or become tasteless.

There are quite a number of what are termed second or third-rate winter pears, which, when properly ripened rank fully equal to better sorts carelessly ripened. There is something in knowing how to raise good winter pears, but more in bringing them to full maturity in the best possible condition.

PLANTING ORCHARDS.

We endorse with emphasis the following very sensible advise on planting orchards from the London Garden.

In preparing the holes preparatory to planting the trees, one can only reiterate that which has often before been quoted, viz., make but one hole—in other words, mellow the soil so deeply that the size of the hole itself will be a matter of small moment. The depth of the hole is, however, of some importance; in my opinion it should not be too deep, but merely sufficient to allow the tree to stand at the proper depth. Tap roots will work their way down almost in spite of all obstructions, but the delicate fibers and small roots that provide the nourishment should have light mellow earth in which to ramble. This is a common sense view of the subject, and it is borne out in practice. Deep holes not unfrequently serve as receptacles for holding water, especially in clayey soils; and when planters fill in the bottom with stones, no benefit of course is derived therefrom, as the accumulated water has no vent.

In soils retentive of moisture, trees should be planted even more shallow than they usually are; but in all cases it is a good rule to bear in mind that trees should always be set shallow. Concerning the selection of trees, planters differ. Most prefer small trees, but success is often attained with trees of large size. There is this difference: a person to succeed with large specimens must first thoroughly understand the nature and requirements of his trees, and be versed in his work, otherwise he will fail; but the merest novice, with small trees, under ordinary circumstances, will not have many to replace. In respect to the selection of nursery trees, I prefer apples three, or, at the furthest, four years of age; Pears, two or three years; Plums and Cherries, two years; and Peaches, one year. These should all be strong and healthy, which is shown not only by the size of the previous year's growth, but by the peculiar glossy appearance of the bark.

A tree that has been unduly stimulated and forced into making a remarkably strong growth, is not so valuable as one of small size with healthy, ripened wood; and the latter, in the majority of instances, will come into fruiting in advance of its more successful competitor. The Grass question, in its application to orchard culture, is one over which there has been much disagreement among practical men; but I doubt if the most strenuous advocate of seeding down to Grass would recommend the practice as soon as the trees are planted. The proper plan is to cultivate carefully for a few years until the trees have become well established, and then allow a turf to form, depending afterwards upon top-dressings.

The Centennial.

CENTURY BLOSSOMS.

THE BOOMER & BOSCHERT CIDER PRESS.

The Boomer & Boschert Press Co., of Syracuse, N. Y., have, under the supervision of its owners at the Centennial, put their press to a remarkable test and accomplished an unprecedented feat in the history of cider making. The problem was:—To make one hundred barrels of cider in ten hours, from eight hundred bushels of apples. This was a bold push in a direction that must test the fullest capacity of the press, and on its successful accomplishment depended the ability of the makers to justify their assertions as to the superiority of their manufactures in the qualities that are most prized in a cider press. Most extensive and careful preparations were made to have the test accurate and thorough in all respects. The entire arrangements were under the supervision of the Centennial Commission, and the apples were weighed and the barrels gauged with great care, so as to insure the completest accuracy.

The trial began on the morning of Thursday, Oct. 26, at 7.30 A. M. and the press was worked precisely nine hours and forty-five minutes. In that time there were ground 870½ bushels of apples, which manufactured 116 barrels and 22 gallons (by weight) of cider! *Consequently, it required just 8 hours and 21 minutes to make the hundred barrels of cider, using only 746 bushels of apples, or 7 46-100 bushels to the barrel.* This result is as gratifying as it is remarkable and marks the triumphant accomplishment of the severest test ever applied to a cider press. During the entire trial, excluding the half hour allowed for dinner, the press worked easily evincing no symptoms of strain of any kind and doing work which, to all appearance, differed in no degree from its daily performances during the time it has been in operation in Agricultural Hall. This test places the presses of this Company in an enviable position.

HALLIDAY'S STANDARD WIND MILL.

The Halliday Wind Mill, made by the U. S. Wind Engine & Pump Co., Batavia, Ills., has received two grand medals of merit and two diplomas of honor on its exhibits, thus placing them in advance of all competitors, and endorsing the opinion of those popular Mills already substained by the Agricultural Community. They were subjected to thorough investigation by the judges, and also successfully withstood the severe gale of Sept. 17th ult., that destroyed so much property, including three Competing Mills. Below we give the two reports:

The U. S. Centennial Commission announce the following Report as the basis of an official award to United States Wind-Engine and Pump Co., Batavia, Illinois:

Official Report:—For powerful and efficient Wind-Engines, with Sectional Sails turning in a transverse axis and capable of being set with their edges to the wind, in which position the mill stops. These sails are held to the wind by an adjustable, weighted lever, ingeniously connected, with radiating arms attached, by jointed levers to the transversed axis of each section. Each arm is provided at its extremity with a weight. When the centrifugal tendency of these weights is sufficient to overcome the weighted lever already described, their action causes the sections to turn their edges to the wind more or less completely, according to their velocity and the force of the wind, so that in a stiff breeze the position of the sections is almost parallel to the direction of the wind, and the least amount of surface is exposed that will keep the mill to its work. * * * *

The above Report is officially signed by A. T. Goshorn, Director-General; J. R. Hawley, President; J. L. Campbell, Secretary.

Official Award to U. S. Wind Engine & Pump Company for Model of a complete Wind Mill with three runs of stone.

Official Report:—Fulfills its purpose of illustration and is admirably constructed. A. T. Goshorn, Director-General; J. R. Hawley, President; J. L. Campbell, Secretary.

This Company's career has been one continued success, and, notwithstanding the cry of hard times, it is running full time, employing its usual large force and the already large business is steadily increasing.

HONEST FERTILIZERS.

The display of fertilizers in Agricultural Hall is worthy of this large and rapidly increasing interest, but the exhibit of the Buffalo Fertilizer Works transcends competition in the uniformity and excellence of arrangement of the exhibit, and the superior excellence of the far-famed "Honest Fertilizers," made by L. L. Crocker.

Farmers have justly placed great reliance in the products of this firm and its superphosphates have come to be considered as standard, The employees are men who have devoted years of patient labor to securing the best results from the various combinations of ammonia, potassium, flesh, blood, &c., with the most pronounced results, so that the products offered by Mr. Crocker can be relied upon as being compounded according to strict scientific formulas, modified by the results of experience on the farm.

The ground bone prepared at the Buffalo works merits special mention. The material is selected carefully, and the treatment of the bone with acids, after its careful and thorough grinding, secures a product that is always trustworthy. This fact can be fully appreciated by those who have used adulterated articles, and it is of great moment to the agriculturist to know where good fertilizers can be obtained. The report here given accompanies the award received by L. L. Crocker, Buffalo, N. Y., and is an indorsement that will carry great weight with it.

The U. S. Centennial Commission announce the following Report as the basis of an official award to L. L. Crocker of Buffalo for his Superphosphates and Fertilizers:

Official Report:—For the good quality of his Superphosphates.

For the Fertilizers made from them, by mixing with salts of ammonia, potassium, ammoniacal liquor, dried flesh and blood.

For the intelligent determination of the manure intended for the plants cultivated.

The above Report is officially signed by J. R. Hawley, President; A. T. Goshorn, Director-General; J. L. Campbell, Secretary.

The Naturalist.

THE COMMON HOUSE-FLY.

Prof. Packard, in briefly summing up the life history of the house-fly, says:

"If in its winged condition it is one of the most disagreeable features of the Dog-days, and people wonder why flies were ever made at all, it should be remembered that flies have an infancy as maggots, and the loathsome life they then lead as scavengers cleanses and purifies the August air and lowers the death-rate of our cities and towns. Thus, while stables and piggeries and filth are tolerated by city and town authorities, the young of the house-fly and the flesh and blow flies, with their thousand allies, are doing something toward purifying the pestilential air and averting the summer brood of cholera, dysentery, diphtheria, typhus and typhoid fevers, which descend like harpies upon the devoted towns and cities. It may be regarded as an axiom that where flies most abound, there filth, death-dealing and baneful, is most abundant, and filth diseases such as we have named most do congregate.

"The life of the house-fly may be summed up as follows:—It lives one day in the egg state, from five days to a week as a maggot, from five to seven days in the pupa state—in all from ten to fourteen days in the month of August—before the winged adult period. It is often asked how long-lived a fly is. Most of the flies which are born in August live for a month or six weeks, and die at the coming of frost, either of cold or from the attacks of fungoid plants. A few, probably, winter over and survive until midsummer, and thus maintain the existence of this useful species, to which civilized man owes more than he can readily estimate, and with which he can dispense only when the health of cities and towns is looked after with far greater vigilance and intelligence than is likely, perhaps, to be the case for several centuries to come.

FLOWERS AND INSECTS.

In his lecture at Belfast on "Common Flowers in Relation to Insects," Sir John Lubbock inquired into the causes of flowers closing their petals during rain, and of some flowers remaining open for a longer or shorter period than others. The habit of closing the petals during rain is obviously an advantage, since it prevents the honey being spoiled or washed away. Everybody, however, must have observed that even in fine weather certain flowers close at particular hours. This habit of going to sleep is surely very curious. Why should flowers do so, and why should some flowers close at the approach of night and others not? Moreover, flowers keep different hours. The Daisy opens at sunrise and closes at sunset, whence its name, *Days'-eyes;* the Dandelion opens at 7 and closes at 5 o'clock; Ear Hawkweed is said to awake at 8 and go to sleep at 2 o'clock; the Scarlet Pimpernel awakes at 7 and closes soon after 2 o'clock, while *Tropæon pratensis* opens at 4 in the morning and closes at just before 12 o'clock, whence its English name, John-go-to-bed-at-noon. Other flowers, on the contrary, open in the evening. Now, it is obvious that flowers which are fertilized by night-flying insects would derive no advantage from being open by day; nay, it would be a disadvantage, as rendering them liable to be robbed of their honey and pollen by insects not capable of fertilizing them. Hence the lecturer believed that the wind-fertilized flowers never sleep, and that some of those flowers which attract insects by smell emit their scent at particular hours.

Floricultural.

CROSS-FERTILIZATION OF PLANTS.

It seems that in many instances where Lilies have been crossed or hybridized (as between *auratum* and *speciosum*), the seedlings have shown no resemblance whatever to the pollen parent. Perhaps if self-fertilized seeds of those hybrids were sown, the influence of the pollen grandparent would then manifest itself.

The agency of the insects and of the wind in cross-fertilizing plants which we had previously supposed were necessarily self-fertilized, shows something of the extent to which we may have erroneously ascribed variations in seedlings to "sporting"—*i. e.*, to an inherent power of the seedling to assume characters strikingly dissimilar to those of the supposed parent. Had we known in such instances that the seedling was not of hermaphrodite parentage but the result of the union of dioecious plants—quite dissimilar in appearance, perhaps, however closely related—the word "sport" might never have found its way to popular usage. Doubtless those plants which fertilize themselves, promote the best welfare of their progeny by so doing. We may trust nature thus far. The artificial fertilization of those which do not fertilize themselves, is chiefly useful to man in enabling him to select parents with a view to results more or less in accordance with his wishes.

NOVELTIES.

Poinsettia Pulcherrima Plenissima, figured p. 341, May 27, the stock of which was sold by Mr. Buchanan to the Messrs. Veitch of London, is now offered by English florists at from five to ten shillings per plant, according to size. It is time that American florists were offering it.

Cornus mascula aurea elegantissima, "A broad margin of pure gold"—so reads the English advertisement—"surrounding a bright green center, is of itself a sufficient attraction; but when in July the tips of the leaves become suffused with the brightest carmine, it is impossible to give an idea of the beauty and elegance of the plant, which will bear a favorable comparison with the best variegated stove or greenhouse exotics. The habit is semi-pendulous and very graceful." Price, 15a21s. each.

Divested of the glow that generally suffuses floral advertisements, we do not see that this need differ strikingly from *Cornus sanguinea variegata*, which our nurserymen sell at 50 cts.

Triomphe des doubles blancs is advertised as the best double white *Azalea* in cultivation. The flowers are larger, more double and of a purer white than in *Reine du Portugal*. The petals are large, round to perfection and crisped. Received first prize at the exhibition of the R. H. S. of Ghent in March, 1875, as the best seedling Azalea.

Dactylis cæspitosa—Tussock Grass. Each plant forms a dense tuft of stems, 6 to 8 feet high, 4 to 5 feet in diameter. The leaves are 5 to 6 inches in length and give to the tufts the appearance of thickets of Palms. According to Hooker, the leaves furnish an excellent fodder for horses and cattle, whilst the agreeable and sweet-tasting stems are good for man as well.

Ornus.—Two new varieties of flowering Ash are described in *Revue Horticole*, viz., *Ornus serotina violascens* and *O. s. alba*. They came from one lot of seedlings and bloom a month later than the ordinary form. Both are dwarf and floriferous, *alba* in no other way differing from the type, while the other has violet-gray flowers.

Begonias.—Many new varieties of striking beauty of the tuberous-rooted section are announced or offered for sale.

MISCELLANEA.

Ageratum.—Countess of Stair seems to be acknowledged on all sides as the very best variety known.

The Gardeners' Chronicle of England talks of *Vernonia noveboracensis* as one of the best of tall Composites. This is our Iron Weed that grows in all low grounds. Prof. Gray calls it a "tall, coarse weed." If Prof. Gray had seen it only in the gardens of Kew, would he still have called it a "tall, coarse weed?" This is one of the most trying disagreements among "Doctors" that we have ever known. We respect Dr. Gray as one of our first botanists. We respect the Gardeners' Chronicle as one of the first horticultural journals in the land. We suggest that Mr. Charles Darwin, Dr. Thurber and the Rural New-Yorker hold a convention to decide the question, Is *Vernonia noveboracensis* a "tall, coarse weed," or is it "one of the best of tall Composites?"

The Editors and Publisher of this paper "kindly volunteer" their editorial rooms for the use of the convention. Will Mr. Darwin or Dr. Thurber fix the date? Let's have this settled. If *Vernonia noveboracensis* is a "tall, coarse weed"—then we do not want it in the Rural Grounds. If it is "one of the best of tall Composites," then we must have it, of course. And there are millions of floriculturists, we doubt not, who feel just in the same way.

Mr. Repton, in his book of "Landscape Gardening," published in 1795, considers that true taste in every art consists more in adapting tried expedients to peculiar circumstances than in an inordinate thirst after novelty, and that this inordinate thirst after novelty is a characteristic of *uncultivated minds!*

This speaks not well for the present generation of people interested in horticultural topics, for a thirst for novelties, ever increasing since Mr. Repton's time, has reached a climacteric now that it would not be easy to eclipse.

California Horticulture.—Attached to the California Horticulturist is a catalogue of Messrs. Miller, Siever & Co., nurserymen and seedsmen of San Francisco. The plants offered therein are of the most ornamental and useful, and many of the prices are quite as low as those of our Eastern establishments. *Liliums Washingtonianum—L. W. purpureum (?)—Humboldti—pardalinum*—all California Lilies—are 40 cts. each; *Auratums*, 30 cts. Young Palms, such as *Latania Borbonica, Chamaerops humilis, Seaforthia elegans, Phœnix dactylifera* are offered at from 50 cts. to $1 each; Koenig Albert, the new double Ivy *Pelargonium*, $1.

In the seed department, the catalogue says: "We are in the habit of collecting throughout the Pacific coast every season, seeds of the most desirable wild flowers. This year we can furnish about twenty varieties, put up in packages for 25 cts. each. These seeds are in great demand abroad, and can be sent to friends by mail." But the names of the aforesaid wild flowers are not given. When we see such plants as the *Passifloras, Plumbagos, Araucarias, Agaves, Dracænas, Ericas, Eucalypti, Grevilleas*, Oleanders and many other handsome things advertised as perfectly hardy in California, we are tempted to wish we were there, in spite of the varied and peculiar charms of the State of New Jersey.

NOTES.

Poisonous Loniceræ.—The Lancet gives an instance of a little boy being poisoned by the fruit (berries) of one of the *Loniceræ*, suffering much as if from the effects of Belladonna. The species of Honeysuckle is not mentioned.

Brazilian Flowers.—Travelers in Brazil speak of Fuchsias 50 and 60 feet in hight, blooming from top to bottom; of large bushes of *Abutilon venosum*, bearing a profusion of orange bells streaked with crimson; of huge *Daturas*, with hundreds of white trumpet-shaped and sweet-scented blossoms, some 16 in. in length; of *Orchids* and Ferns; *Aroids* with shield-like leaves, large enough to cover a man; brilliant red and yellow *Bromelias* and *Tillandsias*; epiphytes and parasites of all descriptions; Camellias large enough to climb into to pluck the topmost blossoms; and *Poinsettias*, grown into very large bushes, on which the crimson star-like bracts are two feet in diameter. So says the Louden Garden.

Arboricultural.

RARE TREES.

Maples.—*Acer platanoides dissectum* has dark-green leaves, the lobes three-parted, somewhat wedge-shaped and each three-cleft and laciniated. The tree is compact and is one of the best for the ornamentation of lawns.

Acer dasycarpum Wieril laciniatum was introduced by Ellwanger & Barry in 1873. The leaves are more deeply cut and the segments more incised than in the Silver Leaf. It is of equally rapid growth and is said to be desirable as a lawn tree if cut back from year to year.

Acer pseudo platanus tricolor.—This is advertised as distinctly variegated with white, red and green which is not true. The variegation consists of occasional splashes of yellowish-green, and at no period, as we have observed, presents red or white. Even this is too dull to form a contrast with the green. The tree, however, is pleasing in its habit and as the price is not higher than that of the ordinary Sycamore Maple, a single specimen may be desirable.

Aesculus.—There are many varieties of the Horsechestnut that outside of pretentious collections or nursery grounds are little known. So different are they in foliage, flower and size that they present as varied an appearance as if they belonged to different orders. A white double-flowering variety is praised by Mr. F. Scorr in his "Suburban Home Grounds." A double-flowering red is likewise advertised. The single-flowering red (*A rubicunda*) with which we are familiar is, as we deem it, one of the most attractive trees in cultivation for home grounds. The cut-leaved variety (*incisum*) is peculiar in its leaves which look as if entire leaves had been torn into shreds. Then there are the gold and silver variegated sorts—in which the leaves are rather blotched than margined with dull yellow and dull white—and *crispum* with crumply leaves as if worms had doubled them up.

Of Alders, we may mention *Alnus glutinosa laciniata* and *A. g. l. imperialis*. The first has oblong and acutely pinnatifid leaves, the second has leaves as finely cut as those of a fern. The first grows wild in France, and though said to prefer a moist soil, thrives in our grounds, so far as we may judge from two years' observation, in dry situations. Both assume a pyramidal form, the latter more pendulously so, attaining a hight of fifty feet or over in congenial soil and climate and are of quite rapid growth. Generally, however, they may be ranked as trees of the third size. Our friends who are adding to their collections or who are planting new grounds will do well to visit nurseries in which specimens of these trees, but especially of *imperialis*, may be observed.

Purple Birch.—Many of our readers are familiar with the Purple Beech, which has heretofore stood unapproached by any other purple-foliaged tree. The Purple Birch bids fair to divide honors with it when better known. The habit of this tree is similar to that of the cut-leaved Birch, the pendulous form of which is so popular throughout the country—but the leaves are entire and larger and of a color even deeper than that of the Beech, as ordinarily seen. What makes it more pleasing is the silvery-white bark which seems to throw out in stronger relief the beauty of its dark, rich leaves. Small specimens are now offered by our nurserymen at five dollars each.

The unfortunate prejudice that Oaks are the giant snails of the vegetable creation has operated against that use of them as lawn trees which their sterling worth and rugged beauty deserve. Some of the finest Oaks, however, grow as fast as many popular trees whose rate of growth is never considered, or at least objected to—and among their numberless species and varieties those may be selected that will thrive in almost any situation.

The Fastigiate Oak (*Q. fastigiata*) is of rapid, upright growth, not unlike the Lombardy Poplar in form.

Q. robur purpurea is, as Louden says, among Oaks what the Purple Beech is among Beeches. He mentions a specimen, thirty feet high, at Arno's Grove, Southgate. We have heard that it is with difficulty transplanted, and believe it, having twice failed ourselves. Of this species there are several with distinctly variegated foliage, some mottled, some margined with silver—and one (*concordia*) with leaves of a golden color.

Acer polymorphum is one of the Japan Maples and, if we may judge from small specimens, forms a decidedly beautiful tree. The leaves are small, five-parted, the segments ovate-lanceolate and incised. A rose color is often blended with a delicate green of the younger leaves while after maturity the others change to the prettiest of fall tints. Many of the varieties of this Maple possess elegantly cut leaves and the most remarkable variegation of any hardy plants known to us. They are yet rare in this country, eight dollars being asked for small specimens.

Betula alba pendula elegans.—This Birch droops directly downwards so that the branches are nearly parallel with the stem. It is a thin, slight, lonely-looking tree which we should rather prefer for a cemetery plot than for a lawn. *B. a. p. Youngii* forms a wider head and is less pendulous.

Magnolias.—Few of these are seen upon Northern lawns as frequently as their large leaves, tulip-like flowers and noble appearance entitle them to be. This is in part owing to their high price; to their aversion to removal unless properly attended to in the nurseries and to the previous selection of species not hardy in the locality to which they have been removed.

Halleana is a Japan Magnolia. The flower, two inches in diameter, has about fifteen petals, pure white with a faint purple tint upon the outside petals or rather sepals. The leaves are comparatively small and the habit compact.

Lennei is one of the finest of the Japan Magnolias and perfectly hardy we believe in the climate of New York, though thought to be a natural hybrid between *conspicua* and *gracilis*. The flowers are as much as five inches in diameter, of a bright rosy-crimson externally, white internally. The leaves are strong, wavy on the edges, acute at both ends and more closely arranged than upon many others.

Soulangeana.—Flowers are five inches across, inside white, outside purple, merging into white along the edges. There are nine petals alternating in threes, each one three to four inches long of a spathulate shape. This is thought to be a hybrid between *conspicua* and *purpurea* and is also hardy in this climate.

Thomsoniana (a seedling of *glauca*)—Fraseri (the Ear-leaved Magnolia) and *cordata* are among the rarest and best of native species. Indeed *cordata*, rejecting that most glorious of all evergreens, *M. grandiflora* of the Southern States as too tender, is, for Northern grounds, one of the best of the family. Its flowers are yellow and appear in June, sometimes again blooming in the fall. It forms a round head and, though of rapid growth, never attains to a size disproportionate to lawns of small extent.

M. macrophylla with leaves sometimes three feet long, is a grand tree for its tropical effect—but although it will stand the ordinary winter, it will not the exceptional one as far north as New York.

Norbertiana is a Chinese variety seldom seen, but it is so close to *Soulangeana* that the one will suffice for both.

Magnolias must not be transplanted in the fall. To insure their thriving, as near as may be, after transplantation, they should first be established in pots.

SUCCESSION OF FOREST TREES.

Newton Reed of Duchess Co., N. Y., contributes a paper to the Country Gentleman upon succession of forest trees which calls to mind the fact that many changes in the kind of trees, seen in old settled regions of country, are similar to those which he mentions as occurring in the Eastern portions of the State of New York. Climatic influences probably cause the destruction of many kinds, which formerly occupied the land, and the replanting of the entire region, would restore previous conditions, followed by the reappearance of species now almost extinct.

Mr. Reed, in speaking of the country about him, says:—A change in the natural production of certain forest trees is observed here, which suggests the idea that there may be in the soil something that demands a succession similar to that which requires a rotation of crops on the farm.

This "oblong valley," which is on the eastern boarder of the State of New York, has been occupied by the whites 150 years. They found some kinds of forest trees here, evidently of mature age, and once of great vigor, which have now greatly waned or nearly disappeared. Other kinds have increased and show a superior vitality. It is an interesting question whether this fact has been observed in other districts sufficiently to give plausibility to the theory.

There are now no pines or hemlocks in the valley, except some on the sides of the rocky and steep acclivities, which rise several hundred feet on each side of the valley. But when the country was first occupied by the whites, there were scattered over the plains large numbers of pines, and there is evidence of a former growth of hemlocks of great size, in the remains of their trunks, which lie embedded under ground, along the creek, in great numbers. These were the production of a period long before the coming of civilization.

When the first settlers came here, they found the white-wood, or American tulip tree, in large numbers, and all their first houses were built of this timber, which was beautifully adapted to the purpose, either for hewing or sawing. The trees were tall and straight, and many of them large. One fair-sized two-story house was covered with siding which was all sawed from one tree. Some of the large trunks were dug out and used in the place of casks. Now the white-wood is a rare tree in all this valley.

Another tree was common then—the wild cherry. Within the memory of the old inhabitants, large numbers of the original trees were standing. Their fine and lofty trunks were striking landmarks in all directions. Many of them were cut for purposes of cabinet work, and all are gone, and there are none of any size to take their places. This tree is naturally and easily propagated by the birds, who scatter along the fences the cherry stones which sprout readily; but yet the wild cherry is coming to nothing.

The button-wood (*Platanus occidentalis*) is another forest tree which perhaps may be destined to disappear from this district. It was once the most majestic of the forest tribes. They had passed their prime when the country was settled. The largest trees were decaying; many of them were hollow and open on one side. One celebrated specimen had room inside for fifteen men standing up, and many trunks were six to eight feet in diameter, and very lofty. In 1835 or 1836 the buttonwood was blighted, and the tender leaves turned black. This was supposed at the time to be the effect of a severe frost, which occurred about the first of June, while the leaf was tender. The next year they had the same appearance, about the same time, and also for several years after.

The tree has never recovered. The knurly appearance of the limbs marked the beginning of the disease forty years ago. There is not a single large and thrifty specimen of the button-wood left in this valley.

The oak and hickory continue to flourish. The former is a long-lived tree. The white ash is not so healthy as once. The hard maple has its favorable locations. It has lost its place, which it had fifty years ago, as an ornamental tree, in the lawn. When dead limbs appear it loses its handsome shape, which is never recovered, while with some other trees a broken limb is replaced with a new growth.

The most vigorous trees which now grow in this part of the country are the elm and the chestnut—the first in the valley, and the other on the mountains. And these are more recent occupants of the soil. When the country was settled, the chestnuts were so few and so valuable for fencing that they were preserved with great care by the first inhabitants. They did not furnish material sufficient for their few fences; oak was used. When my ancestors took possession of this farm, more than a hundred years ago, some of the fences were built of oak rails. Some of these rails were left three or four years ago, and I think I could find a few now. It demonstrates that an oak rail may last a hundred years.

The chestnuts have left the valley almost entirely, and have increased on the mountains, where they were formerly scarce. They now exceed in the production of timber all other kinds of trees, and not only furnish abundant fencing material, but immense quantities of charcoal for the iron furnaces.

The white elm excels in vitality all other trees in the valley. They have not been so long here as those have been in the Housatonic and Connecticut valleys. There are very few, if any, here a hundred years old. But they possess all the viger of youth. They propagate themselves in all favorable places; they ask no planting. Keep the scythe and the ax from the corners of the fences, and you will soon have plenty of these most beautiful forest trees to set in your lawn. It may be that wider observation of this succession of trees would not confirm the suggested theory. I ought to add that the soil of this valley is made of what the geologists call drift.

A WORD FOR FORESTRY.

In his address before the American Forestry Association, Mr. Burnet Landreth gives some hints which should set every American Farmer to thinking, especially since this gentleman is a student of the subject and knows whereof he speaks:

"What I desire now in an especial manner to direct attention to is a branch of agriculture which until recently has been almost entirely overlooked by us. I of course refer to Forestry. Heretofore the way to get rid of timber at the least outlay of labor possible, seems in many cases to have been the object aimed at; and we have gone on in that insane effort until now, while we are still in our infancy as a nation, our country is made naked, and the sources of supply of valuable timber, either for ship building, the mechanic arts or fencing, are so remote that had it not been for the premature extension of railroads penetrating the inmost recesses of the forests, prices would have advanced beyond any reasonable measure of values, and have seriously impeded the constructive arts. * * *

Among other things I wish to start the inquiry whether in our classification of agricultural instruction the time has not come to teach forestry as a science—I say science because it is susceptible of exact results:—Whether in the subdivision of rural interests, the practice of tree-planting should not be clearly recognized among the present and prospective industries of our people. * * * * * *

Now, in recommending farmers with the necessary means to send their sons as students to nurserymen, it is not with any expectation that they should adopt the nursery business as the pursuit of life, but simply to qualify them for the more profitable enjoyment of their paternal acres, and to expand their views beyond the boundaries of the homestead in order to occupy the high position which is an American farmer's birthright.

FORESTS OF OREGON.

There are probably no more valuable forests in the world than those of Oregon, Washington Ter. and British Columbia. The Yellow Fir, which grows there to a great hight and luxuriance, scarcely has an equal for ship building. The supply at present is very abundant and accessible; but there is danger that waste will change the present abundance into scarcity before many years. The rule is: "Let those who live latest have their timber furthest," and in seeking the best now, much that is really good and valuable is ruthlessly destroyed.

Domestic Economy.

ORIGINAL RECIPES.

To Cook Celery.—The outside leaf stalks of celery may be utilized, and a very savory dish made by cutting them in small pieces, and boiling in salted water until tender. Then turn off the water, and add milk, butter, and flour enough to form a thick gravy. Serve hot.—Mrs. Rustic.

Lemon Pie Without Eggs.—In answer to inquiry of "Farmer's Wife" for lemon pie without eggs, I will send ours:—Take one lemon, one teacup of sugar, squeeze the juice of the lemon on the sugar; chop the pulp fine, add one tablespoonful of flour, and one teacup of water; mix altogether and bake with two crusts.—H. E. Alvord.

SELECTED RECIPES.

Wine Sauce for Breaded Chops or Game.—One pint of claret wine, one-quarter of a pound of butter, one large teacup of currant jelly, one teacup of brown sugar, one teaspoon of whole allspice. Melt the butter; add the jelly, sugar, and allspice. Stew until the allspice is preceptible. Strain into a sauce-boat, and serve hot.

Horse-Radish Sauce for Roast Beef.—Mix four tablespoonfuls of grated horse-radish with one teaspoonful of sugar, one teaspoonful of salt, one-half teaspoonful of pepper, two teaspoonfuls of made mustard. Mix thoroughly. Then moisten with sufficient vinegar to give it the consistency of cream. Add four tablespoonfuls of thick cream. Heat (not boil) it, for hot roast beef, and for cold meat serve the sauce without heating.

Smooth White Sauce for Boiled Mutton or Beef.—Two tablespoonfuls of butter, one teaspoonful of flour, one pint of milk, a little salt, one heaping teaspoonful of chopped parsley, two hard-boiled eggs, chopped fine. Mix the flour smooth with a little cold milk. When the pint of milk comes to a boil, add the flour and salt, when this is thickened, add the parsley and butter. Have the chopped eggs in a sauce-boat, and pour the hot mixture on them. Serve hot.

Celery Slaw.—One-half head of cabbage, the tender part of one bunch of celery, two hard-boiled eggs, all chopped fine, mix with it two teaspoonfuls of sugar, two of mustard, one-half a teaspoonful of salt and pepper. Moisten with vinegar.

Mustard Cabbage.—Beat one egg with a tablespoonful of sugar, mix one teaspoonful of mustard in one-half teacup of vinegar; add this to the egg and sugar, and boil until thick, stirring all the time; pour while hot over finely-cut cabbage, previously salted.

COOKING POTATOES.

The following recipes for cooking potatoes are from a late number of the New York Times:

Cooking Potatoes.—Potatoes and all vegetables, in place of boiling, should be cooked by steam, else they must be more or less water-soaked. The simplest and cheapest steamer is easily had by having a steamer made to fit the large iron kettle that every kitchen has. The steamer of tin, made to fit the kettle, the sides fitting down, say one inch, a snug, perfect fit; one inch from the rim is a bottom with holes cut in it, half an inch in diameter and one inch apart. The steamer, like a basin with straight or perpendicular sides, nine inches deep, a tin cover to fit perfectly tight, the cover made to run up higher in the middle two or three inches. This steamer can be made for $1.50, probably. When stewing fruit, put it in an earthen dish; set dish and all in the steamer. The fruit then does not waste its flavor as when stewed with water. Steam puddings, instead of boiling, if you would retain the flavor.—*Experienced Housekeeper.*

Boiled Potatoes.—But few cooks put upon a table a plain boiled potato that is fit to be taken into the stomach. This rule, if followed, makes a potato not only palatable, but digestible: Peel and put into cold water say one dozen peachblow potatoes, and let them stand an hour (longer will not hurt them;) wash them out of the water and put them into boiling water enough to cover them in a sauce-pan with a close-fitting cover; throw in a tablespoonful of salt, and let them boil half an hour; turn off the water, and stand the sauce-pan on the back of the range or stove for five or ten minutes, keeping the cover tightly closed, as herein lies the secret of having a potato look like a snow-ball. Serve in a covered dish, and keep them covered until wanted for the plate. Most cooks lift the cover off the sauce-pan to let the steam escape. This makes the potato heavy and indigestible.—Mrs. M.

Stewed Potatoes.—Take steamed or boiled potatoes which are thoroughly cooked and not hard in the middle; cut them as thin as possible without breaking; put them in a shallow pan; cover with milk; when thoroughly hot, through and through, stir them so that they will not stick or burn, as milk burns very easily; for potatoes enough for six persons, have ready one teaspoonful of wheat flour, mixed smoothly with a little cold water, as if for starch; add this when the milk is hot; mix all thoroughly; let it cook five or ten minutes slowly after the flour is added. At the last minute before serving, salt properly and add one tablespoonful of sweet butter. If kept on the fire very long after the salt is added, the milk will curdle. This should be remembered in making clam or oyster soup when milk is used.—Saratoga.

Potatoes "a la Maitre d' Hotel."—Boil ten middle-sized ones; cut in slices of a quarter of an inch thick; put in the stew-pan half a pint of milk or the same of broth, a little salt, pepper, grated nutmeg, and a tablespoonful of fresh chopped parsley; then simmer on the fire; when boiling add a quarter of a pound of fresh butter and the juice of half a lemon; stir well for a few minutes; when each piece is well covered with the sauce, dish up high in the center, as they must appear light.—A. T. W.

Sweet Potatoes, I.—Cut them in thin slices, and fry like Irish potatoes; be careful not to cook them too much, as they will be too hard.

Sweet Potatoes, II.—Peel and cut in quarters, and fry until the edges are brown. If the roots are very large, cut into eighths.

Sweet Potatoes, III.—Peel and cut into halves, quarters or eighths, and bake with beef or veal, putting them in the bake-pan at the base of the meat.

Sweet Potato Pudding.—Beat to a cream a pound of sugar and one pound of butter; boil and mash fine two pounds of potatoes; beat the potatoes by degrees into the butter and sugar; add five well-beaten eggs, a wine glass full each of wine and brandy, and one of rose water, two teaspoonfuls of mixed spices, and half a pint of cream, and bake in a crust.

Sweet Potato Pie.—To one pound of potatoes, baked and sieved, and one-half a pound of butter, three-quarters of a pound of sugar, one pint of milk and six eggs; flavor with nutmeg and a wine glass full of brandy; line the dish with a crust and bake carefully.

Hygienic Information.

EATING CELERY.

It is scarcely necessary to advise those who like good vegetables to eat Celery. Still there are probably many persons who would not think of using it to promote good health, especially among those who are affected with nervousness. The Builder in commenting on the increase in the consumption of this excellent vegetable says:

We notice with satisfaction that celery is becoming more common and cheaper in our markets; its cultivation cannot be too strongly recommended to farmers, as by its production they not only grow a profitable plant, but confer a benefit on the community, as the habitual daily use of this vegetable is much more beneficial to man than most people are aware of.

A writer who is familiar with its virtues, says: "I have known many men, and women too, who from various causes had become so much affected by nervousness that when they stretched out their hands they shook like aspen leaves on a windy day, and by a moderate daily use of the blanched foot-stalks of celery as a salad, they became strong and steady as other people. I have known others so nervous that the least annoyance put them in a state of agitation, and they were in constant perplexity and fear, who were also effectually cured by a moderate daily use of blanched celery as a salad at meal time. I have known others to be cured of palpitation of the heart. Everybody engaged in labor weakening to the nerves should use celery daily in the season, and onions in its stead when not in season."

To this we may add that a prominent New York druggist draws in winter from his soda fountain a hot extract of celery mixed with Liebig's meat extract, under the name of Ox-celery. It is a nourishing drink at lunch time, far better than coffee or tea, and is doing a great deal in this neighborhood to promote temperance. Distilled drinks are no better for a man than a whip is for a horse to make him work; oats are better than a whip, nobody will deny that, and to keep up the strength of a human being, ox-celery or beef-tea is better than whisky, but this fact many do not appear to know or realize.

But to return to celery; we give it almost daily to our canary birds, and it cures them of fits; they are little animals, with very delicate nerves, easily frightened, and therefore they need such a remedy very much, and the relish with which they take it is a proof that their instinct guides them to eat what is good for them.

A manufacturer of perfumery of our acquaintance some years ago commenced to prepare an extract of celery-seed, put up in medicine bottles, and intended to give strength to old or exhausted persons, who by over-indulgences, have reached such a state as to require restoratives.

Scientific and Useful.

THE JALAP PLANT.

Doubtless many of our readers have had cause to remember a medicine known by the rather homely name of "Jalap and Marcarny" (mercury). Both of these are still known in *Materia medica*, and the former as remarks a correspondent of the London Farmer has an especially interesting history to all lovers of plant lore.

Jalap is a medicine of a resinous kind that is classed by pharmacologists along with the drastic purgatives, and it has the great merit of being certain in its action, whilst it rarely influences the nerves of the abdomen, but rather the vascular and lymphatic system of the minor regions. It is used generally with Calomel, to counteract and assist the system at the commencement of common fevers, in obstructions of the liver, for dropsy, jaundice, and many other ailments "the human frame is heir to." We need scarcely say, then, that as a medicine, when used in the hands of a practical physician and along with other substances, it forms an important ingredient in matters appertaining to pharmacy, &c. It may be interesting to add that Jalap—the Jalap of commerce, that is—has derived its name from the town of Xalapa, or as it is sometimes called Jalapa, situated in the interior of Mexico, and shipped from thence, *via* Vera Cruz. The resin is obtained from the roots, which, considering the kind of plant from which they are derived, are very large, often weighing as much as 40 lb. and 50 lb. These large, somewhat soft, roots are exhumed and divided into moderate-sized pieces; these are then hung over a fire and dried in a week or two by this means. And when produced in commerce these pieces are lumpy or pear-shaped, of a brown shining color, dry and hard, and of a tough, resinous nature.

Like all other valuable drugs or articles of commerce, of a nature not too well known by the mass of consumers, there are adulterations practised, or, indeed, a false article manufactured and offered for sale. The adulterations consist chiefly of dried pears (!) selected portions of the roots of White Bryony, &c.

It may be well to add that a material named Scammony is possessed of similar properties, being more resinous than the Jalap; being the crude juice forced by cutting the living roots, and hence far more powerful. The material differs, however, in its degrees of quality, being exported from Antioch, Aleppo, and Smyrna; to say nothing of a kindred substance which has some currency in France, and is extracted from what is known as the Dog-kill Weed, of Montpelier, and named *Cynanchum monspeliacum*, which it may be scarcely necessary to add is, to say the least, a somewhat dangerous drug. The drug possesses besides the peculiar resin which is its merit, salts of lime, starch, potass, &c.

The Jalap Plant used of yore to be named Convolvulus jalappa and *Convolvulus scammonia*, its technical name now being *Exogonium Purga*, the former or generic name having reference to its jointed stems, and the specific explains itself.

So much of interest is attached to this plant from a commercial point of view; the real merits of this particular genus does not end here, however, as we possess in the Jalap Plant a beautiful, very beautiful in fact, crimson-colored creeper. And we do not know an autumn-blooming subject that is likely to please more than this.

When the plant was first introduced, under the name of Convolvulus as I have previously intimated, it was accorded a place along with stove plants. This, I have no hesitation in saying, however, was done under an erroneous impression, and a want of better experience and information in reward to its habits and capacity generally. Now, however, there need be no hesitation in saying that it is perfectly hardy, and that it will succeed out of doors most perpectly. Its real habit is evergreen, and, as previously intimated, it is a twiner. The blooms, though called crimson-colored, are really more of a most beautifully rich purple, and they are salver shaped.

It is regrettable that the plants, or seeds, its equivalent, are not more commonly met with at our plant marts; as it is, we are afraid they are both scarce and expensive; indeed, in the bulb gardens of Holland they charge as much as half a guinea a plant for it.

The reader should not confound the above with the "Jalap Plant," so-called, and which is better known as the Marvel of Peru (*Mirabilis Jalapa*), as they are not identical, though we do not possess any data to account for the same name being applied to both, excepting indeed it be owing to what similarity exists between their root bases.

"PROGRESS AND IMPROVEMENT."

THE RURAL NEW-YORKER,

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

EXIT CENTENNIAL EXHIBITION.

BEFORE this number of the RURAL NEW-YORKER reaches many of its readers, the great Centennial Exhibition — and, perhaps, we may truthfully say, the greatest industrial show the world has ever produced—will have become one of the things of the past. It will probably require months to remove all the articles on exhibition, but in this the general public have little or no interest, for the battle of the trades is over and the interested spectators departed. As Americans, we may well be proud of "Our Centennial," which all the world were invited to, and nearly all came or sent representatives, who became our guests; and it is to be hoped that we have given them such a welcome, and performed our part so fully and agreeably, that each and every one will go home with the kindest feelings and wishes for the future prosperity of the United States of America.

It is certainly no time for regrets over any failure to show our greatest strength in certain departments, which it must, in all fairness, be acknowledged were meager if not disgraceful, where there might have been, under proper management, a grand display and one worthy of the industry represented. But we may console ourselves for the short-comings of exhibitors in some branches of our national industries, with the fact—which is well known to all nations having any commercial dealings with us—that in those branches where we were weakest at the Centennial Exhibition, we are the strongest in the field or manufactory.

Upon the whole, the Exhibition has been a grand success. Financially, it may not prove to be a very profitable investment to the States and National Government, who have furnished the greater part of the funds for erecting the necessary buildings and preparing the grounds; but this was scarcely expected, and we think no one will regret a deficit of a few hundred thousand dollars for the purpose of celebrating the hundredth birthday of the nation in so befitting a manner.

The Centennial Exhibition has been a grand school for comparison, and the hundreds of thousands of our people who visited it have, without doubt, been greatly benefited by the opportunity of seeing the products of other nations placed in competition with those of our own. Reading descriptions of the products of a country generally fails to convey as distinct an idea of their nature and character as is obtained in seeing them; for, with a majority, the perceptive faculties are far more active and powerful than the imaginative, and to see is to know, or at least the conception of things not seen is very unsatisfactory. Such an exhibition also tends to make us less conceited, for we can learn from it that we are not the only people who are making progress in the arts and sciences; and some of those far-distant nations upon whom we are wont to look as heathen, or low in the scale of intelligence, have challenged our admiration in many of their works of art, science and literature.

A few days since we were shown a large volume on the Arboriculture of Japan. Each page contained a thin section of the wood of the tree referred to, and at the top the Japanese name was given, followed by the Latin or scientific name, as given in our botanies—all of which convinced us that the Japs know more of us than we do of them, and are no laggards in obtaining and putting to use good scientific knowledge. This is but one of the straws which indicate what must result from such great international exhibitions in the way of learning what the nations of the earth are doing; but a still greater result must come from the interchange of ideas and friendly intercourse. These are instructive schools for the masses and peace-makers between nations, and while we bid adieu to our first Centennial with the hope that our bi-Centenary may find the nation prosperous and the people happy, we would bespeak a good word for all such exhibitions whenever and wherever held, as one of the most available means of insuring the peace, progress and happiness of the nations of the earth.

FOR THE PUBLIC GOOD.

WE noticed in Brooklyn, a few days ago, on a corner where two street railroads cross, a settee that some thoughtful individual had placed there for the convenience and comfort of persons waiting for the cars. It stood in a position entirely out of the way of people passing on the sidewalk and was completely shaded from the sun by a house on one side and a large spreading tree on the other. Our organ of calculation was aroused and we tried to imagine how many unspoken "thank you's" would be given to him who so thoughtfully provided for the public. And then it occurred to us in how many ways everybody could do little things that would be of real service to their neighbors, with but little cost of trouble, labor or money to themselves. Occasionally may be seen, by a country wayside, a trough into which the water of a neighboring spring is conveyed, furnishing a convenient place where both man and beast may quench their thirst, but there is not one where there should be many.

A country doctor of our acquaintance spent a portion of his leisure time one summer, some years ago, in planting trees on the village green and laying stones in places where every spring and fall the deep mud in the roads made crossing very inconvenient and unpleasant; and now the whole community rise up and call him "blessed." A heavy shower washes a gully in the road, to cross which, even if it be small, worries a team, vexes the driver, annoys the riders, and endangers the vehicle. Ten minutes' labor would have prevented this. Will you give it?

Constant travel has worn the dirt away from a rock on the path and leaves it, first an inch, then two, then more, above the surface. Will you put a load of gravel about it or, still better, remove the rock or the projecting portion thereof, and for your pains be satisfied with the consciousness of having done a public good? At a crossing or forking of roads travelers often stop perplexed, not knowing whether this or the other is the proper one to take in order to reach their destination. A guide-board, no matter if roughly executed, would be of much service to them and of but little cost to you.

But why stop to enumerate? There are many ways that will readily occur to all in which we may be of service to those about us, if we only have the will to be so, and we hope that by writing these lines we may be instrumental in awakening thought that will result in profitable action. There are none who cannot contribute to the good work; a child can throw from the road a rolling stone that might lame and ruin a valuable horse. Who will be first to do something for the public good?

THE FARMER.

WHEN a farmer can so manage his farm as to make "both ends of the year meet," even if it be with the most rigid economy, he should be contented with his lot. If we take a survey of the business men of our villages and cities, we find that only three or four in a hundred realize a competence for old age. Then imagine the unhappiness of those who, sooner or later, fail to support themselves and families respectably—the cares and anxieties that constantly produce pangs and tortures that no farmer ever felt. These men may apparently lead pleasant lives, as the outside world cannot witness the emotions of a man who daily strains every financial nerve to meet his notes falling due at the bank. The time between one and three o'clock every day, in the city of New York, brings more anxiety to business men than all the farmers of the United States realize in a lifetime.

No, farmers, your lot is not a hard one. Your food may be plain and the cuts of your coats may not be as fashionable as those of the merchants of the day; but when you lie upon your pillows your repose is sound and sweet. The horrors of protested notes seldom keep you awake at night; and in the morning, as you go around to feed your flocks and view your crops that have visibly grown while you were in the arms of Morpheus, you may take more real enjoyment of life in one hour than many city merchants and manufacturers do in a year. Our advice therefore, is, be not discouraged. The times may now be hard; but you are promised "seed-time and harvest" to the end and, with hard labor and judicious management, you come out in the end victorious.

AGRICULTURE—POLITICS.

"IT is a startling fact that there are more than three million farmers who neither take nor read a paper representing their interests, and it shows that although agriculture has recently made more than its usual progress, there is yet a vast benighted domain waiting for the advent of these journals, and sadly needing the kind of instruction which they alone can supply."

Assuming that the above statement made by the Christian Union is correct, the fact is not only "startling" but one greatly to be deplored, viz., that there are three millions of farmers who neither take nor read agricultural journals. Can the same be said as to political journals? We opine not. Perhaps it is with farmers as with editors who are said rarely to read their own papers after publication—they tire of their daily occupation and seek a change. Still, we are impressed that if farmers were to read agricultural literature more and political less, a more satisfactory state of things would be found to exist at the end of every year whether morally, physically, intellectually, socially or pecuniarily considered.

RURAL NOTES.

Sanctum Personals.—Among the pleasant visitations of this Centennial, none are more so than the meetings, face to face, with our various agents from different parts of the country, many of whom we have corresponded with, but never seen. And let us say right here that to them we are always at home, and never too busy to be seen. During the last week our Sanctum has been illuminated by the bright countenance of Mr. W. A. HART, of Friendship, Alleganey Co., N. Y., our common sense occupied with the solid appearance of Mr. O. F. BOARD, of Rushford, in the same County, our labors lightened by the recreative conversation of Mr. JOHN D. WEEKS, of Mt. Morris, Livingston County, N. Y., and our attention chained by the quick, energetic manner of Mr. A. B. CLOSE, of Mayfield, Fulton Co., N. Y. All of these are old-time friends of the RURAL and nothing has given us more pleasure this year than their congratulations upon our success and their wishes for the future prosperity of their fireside companion, the RURAL. What is better than all, is the expression of their intentions to increase the size of their clubs this year, and extend the usefulness of our efforts to their friends and neighbors. Go ahead, gentlemen! We can stand it if you can!! But we must not omit the ladies—yes, the girls added—for we were agreeably surprised by a visit from Mrs. ANNIE L. JACK and her two rosy-cheeked daughters, who had been doing the Centennial. Mrs. JACK's "Whiffs from Canada" are familiar to our readers.

A Heavy Load of Pride.—"An Old Farmer," writing to the Eastern Daily Press (Eng.), tells a complaining correspondent that what weighs down the farmer of England is pride, and that the names of those who train their sons to plow and to sow and their daughters to milk and make butter and cheese, are not found in the list of bankrupts. Nowadays, he says, "shooting, yachting and racing are the glory of farmers' sons, and the drawing-room and ball-room the pride of their daughters." We would not be surprised if some of these accusations were applicable to farmers in this country. The annual influx of country boys and girls—we beg pardon, young gentlemen and ladies—into our cities, is an indication that farm life is distasteful to many who, through some defect of education, are burdened with a heavy load of pride.

The Time to Pay Taxes.—We notice that one of our Western contemporaries is discussing the subject of a time to pay taxes. In our own private opinion the right time is when they are due, and the man who finds it difficult to pay them in December would not be any better off in February or March. Every man with the least eye to business, knowing a year in advance that a certain sum of money will be required at a certain date, can make the necessary preparations for meeting the obligation by laying it aside whenever it comes into his hands, whether it be in June or January. What troubles most persons is the keeping of money—not the making or earning of it.

RURAL BREVITIES.

OUR agents are all predicting a large increase of RURAL subscribers this year and the numerous early clubs now daily received are verifying their prophecies.

THERE is one more bee-keeper who has become convinced that the King-bird sometimes eats honey bees. The suspected birds were killed in the act, and working bees found in their crops.

AGAIN we call the attention of all our LADY SUBSCRIBERS to the SPECIAL OFFER of plants and seeds on another page. Look at it before you renew your subscriptions and you will probably act upon it.

IF there are any game laws it is now time to put them in force, for the crop of loafers who own or can borrow a gun, is very large this year. They swarm over the country, killing the useful birds in great numbers.

THOSE who are looking for a small, profitable farm under high cultivation, would do well to communicate with T. R. PROCTOR, at Utica, N. Y. He has 42 acres of excellent land, with new buildings, which he advertises for sale *cheap*.

THE war-cloud that a few weeks since threatened to overspread all Europe, seems to be disappearing, an event over which humanity should rejoice. We might gain something for a brief period from such a war, but it would be a loss in the end.

THE Centennial malaria still continues, and hundreds find themselves suffering from disease contracted at the great show, in spite of Dr. PEPPER's protest against attributing it to the unhealthfulness of Philadelphia or its suburban surroundings.

ANY ONE having a full set of the RURAL NEW-YORKER from the first number to 1868—either bound or unbound—which they desire to sell, will please communicate with this office, naming price. We have some customers whom we cannot supply.

E. N. FRESHMAN & BROS., the enterprising firm of Advertising Agents of Cincinnati, O., have opened a branch office at Room No. 1, First National Bank Building at Pittsburgh, Pa. It is to be hoped that the FRESHMAN BROS., when they have covered the whole area of the United States, will give the other agents a chance.

INDIAN SUMMER.

Oh! these days,
Autumn days!
When the languid earth lies dreaming
In a sort of golden haze;
When amidst the verdant woodlands
Stand the maples all ablaze:
Gold and crimson, brown and orange,
How they rise,
Glowing pyramids of color,
To the skies.

When the summer tasks are done,
And the song-birds southwards gone,
And no sound
Stirs the voiceless, breathless forest;
Save when, far away and seldom,
The ripe acorn strikes the ground;

Or when leaves,
With a melancholy rustle,
And unstirred by any breeze,
Circling downward from the trees,
Spread around
A rich carpet brighter tinted
Than the cunning Persian weaves.

Oh! these days,
Autumn days!
Who can paint the glow and glory
Of these halcyon Autumn days? *P. C. L.*

The Story-Teller.

A COCOON ENTERPRISE.

BY THEODORA R. JENNESS.

"CAPITAL chances to make money here in Kansas. A girl of ordinary industry can scarcely fail to be worth a comfortable sum by the time she is of age."

With this remark Ruby Gilbert clasped a leather belt about her blue-checked garden blouse, and settled a broad panama upon her head in an independent manner.

Bell Howard, Ruby's cousin from St. Louis, tossed aside her traveling-hat and looked at Ruby interestedly.

"That's good news to me," she said, "for I need to make money if ever a girl did."

Bell was an orphan, but she had been well taken care of thus far in life by an uncle who was a merchant in St. Louis.

"One don't like to depend on a relative all one's life," continued she. "Besides, Uncle Jasper gave me my choice, to remain in the convent with Cousin Blanche, or strike out for myself. I chose the latter—so here I am."

"I respect your sentiment, and you're welcome as the springtime here," returned Ruby, with warm hospitality. "I need a partner in my business so, if you've no objection, we'll shake hands upon a contract."

"Thank you," Bell replied; "but what speculation can *girls* go into on these far-off prairies?"

THE EXHIBIT OF A YOUNG REPUBLIC.

Bell viewed the prospect for a moment and then burst into a laugh brimful of girlish ridicule.

"Mulberries! Thirteen miles from market and not a standard berry, either! You must expect to sell them to the birds and Indian pappooses."

Ruby smiled indulgently at Bell's sally.

"It's not the berries I want—though they are delicious, mixed with raspberries and eaten with sugar and cool cream on a hot summer evening—but the leaves. Throwing aside all mystery, I'm going into the cocoon business."

Bell was somewhat enlightened.

"Ah, I see. Cocoons are made by silk-worms, and they live on mulberry leaves. But what can be done with cocoons in Kansas?"

"Wait a minute and I'll show you."

Ruby ran into the house, and soon returned with a light Indian basket, overflowing with velvet ribbons of every shade and color. She had unwound them all, mixing them in beautiful confusion, that the effect might be more striking.

"How perfectly lovely!" exclaimed Bell; "yards and yards of it. How did you come by it, Ruby?"

"The Marquis de Bossiere gave it me. It was woven in his silk factory, not two miles from here."

"A silk factory in Kansas? Owned by a marquis, too! Is the title genuine?"

"He's a real French nobleman. Rich, and the most splendid gentleman I ever met."

"He must be, if that's the way he lavishes silk velvet on the girls. I shall visit him within a week," said Bell, enthusiastically.

Ruby informed Bell that M. de Bossiere had agreed to purchase all the cocoons she could raise, at French market prices. Some time, she said, she hoped to build a factory of her own and have a wardrobe of home-made dresses, all of silk and velvet.

Bell became greatly interested in Ruby's cocoon enterprise. They sat on the veranda talking, until the spring twilight faded from the sky and the soft dark night grew rosy with the flush of kindling prairie fires.

The terms of the partnership were generous upon Ruby's part. She furnished the entire stock, in lieu of which Bell was to give her labor, receiving one half of the profits.

Ruby had studied the method of raising silk-worms pretty thoroughly, having spent the previous spring helping Antoinette Crozier—a little French girl—tend her cocoon crop at M. de Bossiere's silk colony.

The morning after Bell's arrrival she went with Ruby to examine the buds upon the mulberry trees.

They had begun to swell, and Ruby pronounced it time to "set" the eggs. She and Bell then went into the cellar—a dry, well-ventilated place, with sufficient light to enable them to work without a candle.

The eggs were preserved on cards of pasteboard, suspended from the ceiling by a string. Ruby had kept the eggs in that way through the winter.

When the last card had been taken down and laid upon a hanging shelf, Ruby said to Bell:

"I'm afraid you'll object to having silk-worms for room-mates, but I'd arranged to establish the cocoonery in the spare bedroom, that being the sunniest room of the house."

"They'll not intrude upon me while they're in the egg. I can move into your chamber when they begin to crawl about the room," said Bell.

Ruby laughed at Bell's ignorance of silk-worm habits and they carried the eggs to the spare chamber, or cocoonery, as it must now be called.

Before the south window was built a tier of tables with raised edges, the topmost one reaching nearly to the ceiling of the room. On these tables stood shallow boxes, ready to receive the pasteboard bearing the eggs. Step-ladders stood on either side the tier, that the upper tables might be reached without difficulty. The windows of the room were fitted outside with frames covered with light cloth, that the air might infiltrate slowly, without blowing directly on the worms.

When the "setting" was accomplished, Ruby consulted the thermometer for the regulation of the temperature.

"It must not go below 75 nor above 80," she said. "It stands 77 this morning. If the heat increases much, by afternoon we'll have to raise the windows for a little while."

The girls had little to do for the next ten days. At the end of that time the eggs began to turn from a deep-violet to light-blue, or ashy color, indicating that they would soon hatch, and would need watching.

On the eleventh morning a large number of the eggs had turned quite white, and out of each had emerged a tiny black silk-worm, showing signs of active life.

"Now comes the taking up," said Ruby, animatedly. She and Bell gathered a number of small mulberry twigs, each bearing two or three leaves, and laid them softly on the worms, spacing them to suit the quantity hatched.

The leaves were soon covered with worms, and the girls took the twigs up gently and laid them on newspapers spread beside the boxes on the tables. Care was taken to leave a broad margin,

CENTENNIAL DEPOT OF PENNSYLVANIA R. R.

Ruby pointed down the broad green slope that stretched below the veranda where she stood. "Do you see that grove of flourishing young mulberry trees? I planted them when I was twelve, three years ago."

as silk-worms grow very fast, and after each meal need more space.

"'Twill probably take four days for all of them to hatch," said Ruby, "and we'll have to feed them on scientific principles, that they may come

out even. Do you know the age of silk-worms is reckoned by the number of meals they eat?"

"Some small boys would be aged men if the human calendar were reckoned in that way," said Bell, laughing.

A new army of worms arrived each morning, until, on the fourth day, the last of them were hatched. The worms were separated as they came out, the first hatched being fed but three times a day, while the next in order were fed six times, until they had overtaken the first in age, when they were treated, like them, to a limited quantity of food. The third and fourth were served in like manner, until they were ready to join the others and receive a regular allowance of six meals a day.

"Now they're ready for the first molting," Ruby said, when the worms had all become of the same age. "Silk-worms have five ages. They go through four moltings—or change their skins four times—before they are ready to spin their cocoons."

"Dear me! we can never bring them out of all that tribulation alive!" said Bell, dismayed.

The period from hatching to the first molting is a very delicate one with silk-worms. Ruby and Bell felt almost as if they had the care of a multitude of babies on their hands. They fed them six times a day, with the youngest, tenderest leaves, for three days in succession. At the end of this time the most of the worms were buried beneath the leaves. As many as could be seen had short, thick-set bodies, large heads, and seemed entirely inanimate. This indicated that they had passed into the sleep which precedes the first molting. When the next meal was served, a large number of greedy strangers emerged from under the leaves, with lengthened, slender bodies of lighter color, and with snouts changed also in color and twice their former size. The worms had passed through their first molting.

With the second molting the silk-worms became of an almost ashy hue. The third rendered them still lighter, larger, and more ravenous, with feet the color of white and yellow silk.

At this stage an unlooked-for incident occurred. One afternoon, as Bell and Ruby were in the mulberry grove filling their leaf-bags for the silk-worms' supper, Antoinette Crozier rode up on horse-back, attended by a boy with a handsome and foreign air.

"Henri de Bossiere, a nephew of the marquis, over from France upon a visit," said Ruby in an undertone.

"Dear me! has he a title, too?" said Bell, a little flustered by her work-a-day appearance.

"Yes, he inherits his uncle's title; but never mind, he's a first-rate boy and not a bit stuck up," Ruby answered, still more softly, as she bestowed a friend's nod on the new comers.

The young marquis saluted Ruby with a gallant bow and then gave Bell a quick, admiring glance. Bell was a pretty, fair-faced girl, with light golden hair—"a cloister lily," Ruby poetically called her.

Henri's manner indicated extreme solicitude upon some subject.

"Hasten, my vera young dear mademoiselle," he hurriedly exclaimed. "*Votre beau* bugs moost die for zey has no *bon* air to lif on!"

The girls looked at Henri with astonishment, not unmingled with alarm.

"He means your silk-woems *will* die *if* they have no good air to live on," Antoinette explained.

Henri continued with his broken English and rapid French articulation:

"Ah, *mon Dieu! it est* thunder!"

The last word served to enlighten Bell and Ruby. They glanced hastily at the sky. Great black clouds had heaped themselves above the prairie. It lightened rapidly. A heavy roll of thunder sounded westward. Ruby suddenly remembered the danger that threatens silk-worms in a thunder-storm.

"Oh, our precious silk-worms! What can we do to save them?" she exclaimed, with great anxiety.

"Burn zem! burn zem!" responded Henri, with an emphatic gesture.

"He means *smoke* them," Antoinette explained again.

By the time the party reached the house, rain was pattering on their heads, and the lightning seemed to play beneath their very feet.

Bell's first movement, on reaching the cocoonery, was to close an open window.

"Not so, not so, *petite mademoiselle*. You would suffoocate a buffoolo-horse in zat way," said Henri, laying a detaining hand upon Bell's arm. He then opened the door which led into the hall and raised the windows to the hight of a few inches. This done, he looked at the thermometer and exclaimed, with increased energy:

"Up, up, up! he moost go down!"

Henri attempted to raise a window higher, but a blinding flash of lightning arrested the movement, while a gust of wind sent a deluge of rain through the open space beneath the window.

"Zat moost not be. Too mooch more wind make it so bad as none *le trifle*," he said, closing the window hastily. The silk-worms had begun to exhibit signs of suffering from the effects of the stifling atmosphere. A great number of them seemed almost dead.

Fortunately there was a large basket of leaves in the cocoonery, collected by the girls that morning in removing the litter from the tables where the silk-worms lay. Henri threw a part of the leaves into the stove and touched a lighted match to them. A purifying smoke spread through the apartment and the air began to lighten almost instantly. Henri kept up the smoke until the shower had ceased and the silk-worms passed through the ordeal in safety.

"How can we ever thank you, monsieur? If you had not been here to help us, our valuable *bugs* might all have died," Ruby said to Henri, with a spice of mischief in her tone.

"Ah, I see I should hafe say zem wormes. Ze eyes of mademoiselle tell me zat so," returned Henri, looking mortified. "I haf bad English zo I study him so great befoore I leaf my native France."

Ruby at once regretted her mischievous allusion and Bell began to mend the matter with ready tact and kindly sympathy.

"You speak English well for such a stranger," she said. "Much better than I could speak your language, although I've studied French ever since I was a little girl."

"Ah, fair beautiful, you haf lifted a heavy weight from my sad heart. *Je vous remercie* for speaking so vera kind," replied Henri, gratefully. "I shall come once more and see ze worms and listen to *la belle mademoiselle's* sweet tongue. *Au revoir.*"

The fifth transformation was the most laborious and most dangerous with the silk-worms. They whitened visibly and became feeble and emaciated.

"They look as if they were all in the last stage of consumption," Bell said, as she and Ruby gave them the first meal after the greater part of them had passed through the transformation.

"They'll begin to fatten now and eat enormously. We'll have a siege for about eight days, picking leaves for them," Ruby said.

The worms were fed plentifully three times a day. When the leaves were thrown to them they fell upon them with a noise like pattering rain, gnawing the leaf close to the wood. The season of hard work soon passed, and the girls began to realize their reward almost before they had hoped for it.

In six days after the fourth molting, the worms became transparent, as if containing a clear liquid, gold-colored, white, or green, according to the different breeds. Raising their heads uneasily and moving to and fro, they began to *spin their cocoons* among the leaves.

"Now comes the poetical translation. It's time to set the heath," said Ruby, joyfully.

Instead of the traditional heath used in Southern France, boughs of oak were used to form the cells in which the cocoons were to be lodged. These were set perpendicularly, in straight rows across the table, the tops of the boughs being formed into archways, by resting them against the floor of the table in the next tier.

Ruby and Bell were charmed with the fairy-like developments that followed the setting of the heath. The silk-worms started into motion, climbing up the branches, leaving a fine thread attached to every sprig, surrounding themselves by degrees with a transparent gauze. An elegant form was shaped. The silk-worm was yet seen, but the tissue thickened rapidly, taking in color green, white or yellow, until the insect finally disappeared from view.

In twenty-four hours the cocoon was perfected.

"It seems wonderful how mere insects can work such magical results within so short a time," said Bell.

"Yes; and the Marquis de Bossiere says each one of these balls contains thirteen hundred yards of thread, which is so easily wound off that the reel may be made to turn as fast as the wheels of a carriage driven at full speed and not break the thread."

Owing to the tardy worms that were slow to begin their work, the girls did not gather their cocoons until the fifth day after the first of them were formed. The bushy cabins of the silk-worms were taken apart and the boughs laid carefully upon the floor.

The spotted or stained cocoons were removed at once, that they might not soil the others. The sound ones could easily be told by their solidity. When the cocoons had all been gathered, they were weighed in baskets and spread on the well-cleaned tables where the worms had spent their lives. This being done, the finest cocoons were picked out for seed the coming year. Ruby and Bell selected the strongest, most elegantly-shaped and those whose tissue or thread was finest.

"We shall be spared the tragical closing scene which falls to the lot of so many silk-worms," Ruby said. "If M. de Bossiere had not agreed to receive our cocoons immediately, we should have to stifle the chrysalides or bake our worms in a hot oven."

"That would be shocking work!" Bell said, with a shudder. "I feel as if the little silk-worms were almost like little brothers and sisters to us, we've exercised so much care over them."

The cocoons saved for seed were strung in chaplets and hung in the smoke-house, that being a well-ventilated room and free from mice. In about twelve days butterflies emerged from them, who soon paired themselves and began to lay their eggs.

Ruby and Bell delivered into the hands of M. de Bossiere four hundred and twenty-one pounds of cocoons, for which they received seventy-five cents per pound in gold, making three hundred and fifteen dollars, seventy-five cents. This, divided equally, gave to each a clear profit of one hundred and fifty-seven dollars eighty-seven cents, the wages for scarcely one month's labor.

"You have done very beautiful work, my dear young ladies," the marquis said, approvingly. "If more of the youths of Kansas and other parts of the United States could gain so clear an insight to my favorite plan, what a rich and lovely land might America become!"

"And how sweetly glaring might ze ladies all be made to shine in silk, like bootifies among ze flowers in ze sun's blazes. Ah, *charmante!*" added the young marquis, gazing rapturously at Bell who, in honor of the occasion, had dressed herself, St. Louis style, in a pretty blue silk costume, with hat to match.

This was only the beginning of cocoon-raising with Ruby and Bell, you know. The enterprise bids fair to become of noticeable magnitude, as the years give it time to grow. Bell will remain in Kansas. Ruby's father has given the two girls a very cunning farm of forty acres, cut off from a cattle-range adjoining the Gilbert farm. Here they can plant extensive mulberry groves—cultivating the land with paying crops while the trees are small—build a cocoonery and, years hence, a silk factory, if Ruby's air-castles float serenely.

The marquis' nephew, Henri, has decided to relinquish his title in France and devote his energies to silk culture on the prairie, in company with his uncle.

I wonder if fair Bell has anything to do with the young nobleman's voluntary resignation?

Time will show.—*Wide Awake.*

BATTLES OF THE REVOLUTION.

BELOW we give a list of all the important battles of the Revolution. They began April 19, 1775. They closed October 19, 1781—six years and six months. The British sent 134,000 soldiers and sailors to this war. The colonists met them with 230,000 Continentals and 50,000 militia. The British let loose Indians and equally savage Hessians. The colonists had for allies the brave and courteous Frenchmen. The leading battles of the war—those particularly worthy of celebration—are Concord and Lexington, Bunker's Hill, Long Island, White Plains, Trenton, Princeton, Bennington, Saratoga, Monmouth, King's Mountain, Cowpen, Eutaw Springs, Yorktown. These are of national interest. Many of the others are more especially local. The disposition is to celebrate them all—victories or defeats—to recall the deeds of our ancestors and to have a good time generally. Our readers will do well to preserve the following list of the revolutionary battles:

Lexington (first skirmish)	April 19, 1775
Ticonderoga	May 10, 1775
Bunker's Hill	June 17, 1775
Montreal (Ethan Allen taken)	Sept. 25, 1775
St. John's besieged and captured	Nov. 3, 1775
Great Bridge, Va.	Dec. 9, 1775
Quebec (Montgomery killed)	Dec. 31, 1775
Moore's Creek Bridge	Feb. 27, 1776
Boston (British fled)	M'ch 17, 1776
Fort Sullivan, Charleston	June 28, 1776
Long Island	Aug. 27, 1776
Harlem Plains	Sept. 16, 1776
White Plains	Oct. 28, 1776
Fort Washington	Nov. 16, 1776
Trenton	Dec. 26, 1776
Princeton	Jan. 3, 1777
Hubbardton	July 7, 1777
Bennington	Aug. 16, 1777
Brandywine	Sept. 11, 1777
First battle at Bemis' Heights, Saratoga	Sept. 19, 1777
Paoli	Sept. 20, 1777
Germantown	Oct. 4, 1777
Forts Clinton and Montgomery taken	Oct. 6, 1777
Second battle at Bemis' Heights, Saratoga	Oct. 7, 1777
Surrender of Burgoyne	Oct. 13, 1777
Fort Mercer	Oct. 22, 1777
Fort Mifflin	Nov. 16, 1777
Monmouth	June 28, 1778
Wyoming	July 4, 1778
Quaker Hill, R. I.	Aug. 29, 1778
Savannah	Dec. 9, 1778
Kettle Creek, Georgia	Feb. 14, 1779
Brier Creek	March 3, 1779
Stone Ferry	June 20, 1779
Stony Point	July 16, 1779
Paulus Hook	Aug. 19, 1779
Chemung (Indians)	Aug. 29, 1779
Savannah	Oct. 9, 1779
Charleston (surrendered to British)	May 12, 1780
Springfield	June 23, 1780
Rocky Mount	July 30, 1780
Hanging Rock	Aug. 6, 1780
Sander's Creek, near Camden	Aug. 16, 1780
King's Mountain	Oct. 7, 1780
Fish Dam Ford, Broad River	Nov. 18, 1780
Blackstocks	Nov. 20, 1780
Cowpens	Jan. 17, 1781
Guilford	M'ch 15, 1781
Hookirk's Hill	April 25, 1781
Ninety-Six (besieged)	May and June, 1781
Augusta (besieged)	May and June, 1781
Jamestown,	July 6, 1781
Eutaw Springs	Sept. 8, 1781
Yorktown (Cornwallis surrendered)	Oct. 19, 1781

THE LOCOMOTIVE vs. SUPERSTITION.

WHEN the Nicholai Railway was constructed, in 1848, from St. Petersburg to Moscow, the work was done under contracts with American engineers and the cars and engines were supplied from Baltimore by the famous establishment of the Winans Brothers. The Russian priests oppose every modern innovation and, of course, they were "down" on the railway. When the road was opened they determined to stop it, and so they went in force to a point on the road and set up a holy picture to stop the new work of the devil. The train came slowly along and the engineer, seeing the picture standing on the track, thought there must be a man behind it, and so came to a halt. The assembled multitude raised a shout and the priests called out that the saint was all-powerful and would prevail against wickedness. The officer in charge of the train came out and took a survey of the situation. Then he told the engineer to run back a quarter of a mile and bring the train to a halt. The shouting was redoubled and the priests were in the most rapturous delight. But their exultation was soon changed to grief as the master of ceremonies told the engineer, "Put on all steam and go ahead without regard to consequences." The engine went ahead and down fell the holy picture, torn and crushed by the wheels of an American locomotive. Modern civilization was triumphant and the priests and their followers no longer shouted in triumph.

HOW TO WOO A WOMAN.

Woo a woman bravely. If there is anything humiliating to a woman, it is to have a lover whom she wishes to honor, weak and vapid, ever yielding and half afraid of her. She longs to tell him "to act like a man!" The man who conceals or denies his love for fear of being laughed at, is a coward. A love that has no element of divinity in it is not love, but passion, which, of itself, has nothing ennobling. That was a beautiful inscription on an engagement ring, "Each for the other, and both for God."

Sabbath Reading.

KEEPING LENT.

Is this a fast to keepe
The larder leane
And cleane
From fat of veales and sheape?

It is to quit the dish
Of flesh, yet still
To fill
The platter high with fish?

Is it to fast an houre,
Or ragged goe,
Or show
A downcast look and sowre?

No! 'tis a fast to dole
Thy sheafe of wheate,
And meate,
Unto the hungry sowle!

It is a fast from strife,
From old debate,
And hate
To circumcise "thy life."

To show a heart grief-rent,
To starve thy sin,
Not bin,
And that's to keepe thy Lent!

—*Robert Herrick*, 1591.

PRAYERS FOR OTHERS.

IN Dr. Mell's little book on "The Utility of Prayer," the author says of the scriptural command to pray for others:—"God requires us to present to him intercessions for others, not because he needs information from us of their wants, or because he waits for an impulse to act in their behalf, but because he would cultivate our Christian graces. The waters of benevolence are refluent; and he is watered most in his own soul who is most active in watering the souls of others. God requires us to pray for others that we might thus be stimulated to work for them. No one can, in good faith and with strong desire, pray for a good thing in behalf of another, without standing pledged to do all in his power to help him to that good thing. No one can truly pray for the salvation of another without feeling impelled and pledged to do all in his power to bring him to Christ. His personal efforts, in all judicious ways, will inevitably accompany his prayers and grow out of them. No one can pray for the salvation of the heathen without virtually pledging his property and, if necessary, himself also, to carry to them the glad tidings of salvation. Desire prompts the prayer and the prayer increases the desire, and both exert an influence upon the petitioner—the one by direct power impelling, the other by reflex influence pledging him to active efforts to the evangelizing of the heathen.

THOUGHTS FOR THINKERS.

GOD chooses that men should be tried; but let a man beware of tempting his neighbor. God knows how and how much, and where and when. Man is his brother's keeper and must keep him according to his knowledge.—*G. Macdonald.*

HEAVEN will be a world of peace and rest—for the "weary and heavy laden" will be there. "He giveth his beloved sleep." They shall rest at last in the beautiful and tranquil world they thirsted for so long, where the spirit shall be willing and the flesh never weak.—*Greg.*

FAITH relies upon the truth of what God hath promised and Hope waits for the enjoyment of the good in the promise, but more especially for the glory which is to be revealed. This hope of glory is full of rejoicing, because everything which Hope looks at and draws its joy from, depends on the truth and faithfulness of a covenant of God. There can be no failing on His part, and therefore on the believer's there can be no disappointment. —*Romaine.*

MOST PEOPLE need all the strength which a high-toned public opinion can give them to keep them true to their conscience and their God; and that opinion is partly formed by what we do and what we are. Strive earnestly, then, to order your life with a wise simplicity. Be frugal in the shows and generous in the substances of life. Set the example so greatly needed, of wholesome moderation. Show that you care for character above all else.—*Rev. H. W. Foote*

THE strongest argument for the truth of Christianity is the true Christian; the man filled with the spirit of Christ. The best proof of Christ's resurrection is a living church, which itself is walking in a new life and drawing life from Him who hath overcome death. Before such arguments ancient Rome herself, the mightiest empire of the world, and the most hostile to Christianity, could not stand. Let us live in like manner and then, though hell should have a short-lived triumph, eventually must be fulfilled what St. Augustine says, "Love is the fulfilling of the truth." —*Christlieb.*

A MAN diseased in body can have little joy of his wealth, be it ever so great. A golden crown cannot cure the headache nor a velvet slipper give ease to the gout, nor a purple robe fray away a burning fever. A sick man is alike sick, wheresoever you lay him—on a bed of gold or on a pad of straw; with a silk quilt or a sorry rag on him. So no more can riches, gold and silver, land and living, had a man much more than ever any man had, minister unto him much joy; yea, or any true or sound joy at all, where the mind is distract and discontent. Without contentment there is no joy of aught; there is no profit, no pleasure in anything.—*Galaker.*

Ladies' Portfolio.

UNDER THE ROSE.

I am cold and I am light
As the fleecy, floating snows?
If a thorn ran through my heart
You would only see the rose.

Fickle, shallow, thoughtless, gay?
And you truly think me so?
You may view the ocean's foam
But its deeps lie far below.

Come and stand by me awhile
Where no other friend has been;
I will open wide my heart,
I will show you all within.

What!—you start and turn away,
And the tears begin to fall!—
Ah! my heart!—you thought it gay?
It is broken—that is all.

[*J. H., in Scribner's.*

HOW SHALL WE EDUCATE OUR GIRLS?"

An article in the Rural of Sept. 23d, and a reply in the issue of Oct. 7, relative to the education of girls, treat the topic, which is usually a very important one, neither as broadly on the one hand nor as seriously on the other, as it deserves to be. So much is talked and written of the education of girls, as to lead one to suppose that it is an affair so entirely different from that of boys, that parents and educators are put to their wits' end to know just what it should be. If the object of educating anybody be to bring about a degree of mental development and discipline, and to fit the individual for self-dependence, wherein, pray, should the education of the girl differ materially from that of the boy? True, the duties of the one will differ from those of the other, but for capability in *general* usefulness both require very much the same educational training. During the time of my own school life, which covered a period of fifteen to eighteen years, I studied a variety of subjects which not a few good friends declared would never be "of the slightest use" to me. But after a trial of active life, I have found that not the slightest thing I ever learned, whether in art or science or "practical drudgery," if you please, has failed to be of some service to me. I make this personal observation, because I believe it to be the experience of every woman whose life is full of duty and activity. I think many people mistake the meaning of *use*, in applying it only to financial result or its equivalent. What cheers, brightens and beautifies life, is of use equally as well as what cooks the dinner or coins dollars. When I say—and I *do* say it—that every farmer and farmerine ought to be well versed in geology and botany, I opine that the majority of agricultural workers will smile ironically and ask for what *use?* For the best and brightest use, I answer,—the ability to appreciate and enjoy the wonderful nature in whose midst they live out their lives, and of whom they too rarely know just nothing at all of her charms and her mysteries. I know a woman of unusual culture and intelligence, who has lived all her life in the "backwoods," whose labors have been the homeliest of domestic and farm-house duties, but whose life is made bright and even radiant by her profound knowledge of botany. To sit an hour at her feet and hear her talk of what she sees in the natural productions about her, the leaves, flowers, grasses, etc., is a luxury of entertainment no woman of purely fashionable accomplishments could hope to dispense.

No woman in the whole woman's kingdom is so much to be pitied as she whose life is drudgery from morning until night, and into whose education has been planted no means of intellectual entertainment or recreation. Few women, comparatively, possess the genius of the western country woman whose butter-bust of the "Dreaming Iolanthe" in the Woman's Pavilion in the Centennial Exhibition has been the object of probably more curiosity than any other single exhibit. She amused herself—for amusement is in reality a *necessity* of life—in molding her butter as she worked it into various forms, little dreaming that with her simple implements—a couple of brushes and a few broom splints—she was modeling in a fashion that would be the fortune of a sculptor. So in the education of a girl, there should be two things accomplished: she should be trained in some one thing so thoroughly—something for which she has a taste—that it will always be to her, whatever her fate in life, a source of recreation; this may be any one of the numerous natural sciences, natural history, a fine art,—something to occupy and invigorate her mind, and that will *not* tax her emotional nature, as does novel reading and brooding over the sorrows and ills of life. The other essential is a sufficiently intelligent knowledge of something, by which she can earn her own living in case of need. If the two essentials are happily combined in one thing, so much the better.

Hardly a half year passes, but that I meet with one or more women whom misfortune compels to work, or who, seized by a noble ambition to accomplish some achievement in life, find themselves helpless from not knowing how to do anything thoroughly well. They have had their smattering of education in a boarding school, but are masters of nothing. For this reason, and for the reasons of health, respect and happiness, I would, if I had one or a dozen daughters to educate, have them so thoroughly drilled in some handiwork, that each one would be able to support herself easily and respectably by it, if necessary. Until a girl is in some such way prepared for self-support, her education is scarcely more than begun, and her parents' duty toward her only partially fulfilled. I have somewhere read that Queen Anne understood *thirty* different occupations so well, that she could have commanded good wages in working at any one of them. There is scarcely a woman of rank in all Europe who is not fairly accomplished in some art or science, and everybody knows that the education of princes and noblemen is of a most thorough and practical character. Nothing more surely points out the *parvenu* or plebeian than a contempt for useful knowledge, lowly as it may be in character.

There are several trades or professions, the skillful acquirement of which will always render a girl independent. Among these may be mentioned engraving, designing, rapid sketching, dress-making, telegraphy, pastry making, cooking, book-keeping, making button-holes, painting porcelain and pottery, silk-worm culture, short-hand writing, pharmacy, type setting and nursing the sick. These, it will be observed, include none of the commoner accomplishments, as music and the languages, or the several professions, as medicine and chemistry.

Any one of the above-mentioned occupations, when executed in a superior manner, lifts the individual out of drudgery into a comfortable and respectable position. No mistress is so respected by servants as she whose knowledge and skill render her independent of them. First-class cooks command a salary ranging from $50 to $500 a month! I have been told that a cook to one of the New York club-houses receives a salary verging on to eight thousand dollars a year, and Madame C——, probably the finest dress maker in New York, and an Irish lady at that, has an income from her profession ranging from twenty to thirty thousand dollars a year. Skill, taste and tact of a high order in *any kind* of honest work, must and do command respect. As a girl cannot and ought not to learn everything, see to it that she learns some *one* thing *well*. Every girl, whose circumstances permit it, should insist upon it that she be rendered self-supporting in her own person. That she is to marry or not, has no more to do with the character of her education than it has with that of a boy, whether *he* is to marry or not. Marriage is not an infallible insurance against anything. Its demands are usually such that no woman ever yet found herself too well qualified in any respect for its duties, and in its comprehensive sphere she not only generally finds room to exercise, but a demand for, her specific talent. If a "rainy day" comes to her, it is her fortune in reserve, and if prosperity always attend, she is respected by husband, children and neighbors proportionately more for her skill in some useful art.

Mary Wager-Fisher.

Bryn Mawr, near Philadelphia.

TREAT YOUR BOYS WELL.

Some mothers try to reach the soft side of their boy's nature with a kind word; some with a harsh word; and some with an old slipper. Some mothers try it in this manner:—"Now you great, big lubber, get right out of here and stop that outlandish noise, will you! Don't you know better than to whistle in the house? You are always in the road. Go way, and don't let me see you again to-day." Now Jim, John or Peto—whatever his name may be—will withdraw, and boy-like will say nothing; but boy-like again, will keep up a big thinking. If we could reach his thoughts it is more than likely they would run in this channel: "Now why can't mother give a fellow a kind word once in a while! I know I ain't the worst boy in the world, but she appears to think so. If I am always in her way why does she always call for me when she wants a pail of water or an armful of wood? Why ain't I in her road then? It must be a disgrace to be a boy, for she and sisters are always snubbing me because I am a boy. I wish I was away from home, then I could have a few minutes' peace." If he goes down town with a view of finding a place where he is not in the road, it is very likely that he will not find the purest and best company in the world. The boys with whom he will have to associate have been through the same mill that he has, and being deprived of the home influence which they should have, they are not exactly model boys. They will swear, smoke, chew and play cards; and if J., the subject of our sketch, falls into the same ways, who is to blame? Mothers and sisters, for heaven's sake, make your home attractive for your boys. Don't find fault with them every time they stir, because boys are by nature a noisy set. Who would have them otherwise? Treat your boys well and give them good advice—in small pieces; don't feed them too much at once, or it will act in the wrong direction. Give them kind words, and you will never pass any sleepless nights on their account. A boy who has the right kind of a home will *never turn out bad.*

CROWNING A ROSIERE.

The Rosiere of Puteaux, in France, who was elected one Sunday, recently, and duly crowned in the presence of the civil and religious authorities, is a Protestant, her name Mlle. Hummel. She will receive on her marriage day the sum of $150, being the interest on $3,000 left by a citizen of Puteaux for the purpose of encouraging virtue by temporal rewards. Ten candidates presented themselves this year for the honor and profit of being named rosiere; and it is painful to add that the claims of four were dismissed after an examination which was of the briefest. The merits of the six remaining ladies, being above discussion, were subjected to the infallible test of the ballot, as exercised by the wisdom of a rural municipal council; and Mlle. Hummel was found the most worthy.

Reading for the Young.

DO YOUR BEST.

The heart and mind of man and man
Must differ, it is true,
And so the deed our neighbor does
Perchance we ne'er could do;
And thus, in climbing fortune's hight
To reach the fame in store,
If people only do their best,
The world will ask no more.

Does then the little humming bird
Its tender song forsake,
Because the nightingale's sweet voice
May softer music make?
Or does the tiny, twinkling star,
Which lends to earth its light,
Repine because some kindred orb
May chance to burn more bright?

And so thro' life we find that some
Are clad in praise and fame,
While others meekly plod along,
With naught to gild their name;
But when each life is reckon'd up,
Its doings counted o'er,
If we can say, "I did my best,"
Our God will ask no more.

[*N. O. Picayune.*

TO ALL OF YOU!

So many Girls and Boys have expressed their admiration for and interest in the Rural, that we have concluded to give them an opportunity to show the same in a substantial manner. We thank them all for their expressions of good feeling; we desire to pay them well for their work and have, therefore, prepared the following Premium List for that purpose. Look it over carefully and when you have found something which you want, begin your work and send us names enough to secure it. Now let us see who will do the best!

HOW TO MAKE A KITE.

Prof. Peabody of the Massachusetts Agricultural College tells the boys in the Bright Side how to make a kite that will fly:

Among the various kinds, the "three-stick kite" is probably the surest for the beginner. Get three light, thin, straight sticks of cedar, pine or similar wood; smooth them, and let them be about half an inch wide by an eighth thick; perhaps a little more. Make two of them thirty inches long, and the third twenty inches. Mark a point ten inches from the end of each of the long sticks, and in the middle of the short one; cross the three sticks at these points, and tie them firmly with twine. Cut notches lengthwise across the ends of the sticks, and tie a strong twine from end to end, making the outline of an irregular six-sided figure, of which the bottom may be sixteen inches long; the sides about eighteen and one-half; the shoulders eleven, and the top eight inches. These numbers may vary; it is necessary only that the corresponding sides should be exactly alike or the kite will not be well balanced. This finishes the frame.

Now lay down a sheet of strong, light paper, place the frame upon it, and cut the paper about two inches larger than the frame, all around. Fold the outside over the strings, and paste down with good boiled flour paste, cutting out the corners where they over-lap.

The next thing is to hang the kite. Measure from each lower corner five inches along the sticks; make a small hole on each side of the stick through the paper, and tie in the ends of a string, which shall measure, when tied, about fourteen inches from stick to stick. This is the lower loop. In like manner tie an upper loop, about eight inches long, to points about three inches from the upper end of the same stick. Remember to have the loops on the face side of the kite, that is, the side on which the sticks are not seen. Join the middles of the two loops by a string about twenty inches long; this is the belly-band. Hang the kite by the belly-band over your finger, and hold it so that when one end of the kite touches the floor, the other may be about a foot above it; there is the place to tie the line, making it so fast that it will not slip. When the kite floats in the air, it should lie at an angle of about forty-five degrees; if it stands too straight, the string is fastened too low on the belly-band; if too flat the string is not low enough.

The kite must have a tail to balance it. If the tail is too heavy, the kite will not raise it; if too light, as is usually the case, the kite will not "stand" steadily, but will dive from side to side. Whenever it does that it should be taken in, and more weight added to the tail. Cut pieces of writing paper, four inches wide and six or eight long; fold back and forth, fan like, tie them three inches apart on a string, until you have made three or four yards. Then cut a quantity of strips half an inch wide, and twelve or fourteen inches long; tie the bunch of them by the middle, fold the ends together and tie again, making a tassel, which you may tie to the end of the tail. If the strips are of colored tissue paper, all the gayer. Tie a string about twenty inches long to the two lower corners of the kite, and fasten the tail to the middle of it. Choose a smooth, close, well-spun string, linen is best—and costs most—not too large, or its weight will make it "sag," or too small, or the kite will fly away with it. Finally, don't try to fly a kite when the wind don't blow.

Now, just as each of your good mothers thinks she has a recipe for making cookies, which she thinks is a little better than any other, so every boy who has experience in kite-making, thinks his way is rather the best, and quite likely he may find fault with some of our proportions. If so, he has perfect liberty to change them to his liking. The important items are: the kite must be truly made so that one side may just balance the other; it must hang at the proper angle to the wind; and the tail must be rightly proportioned in weight to the size of the kite.

If the kite don't behave well at first, think which of these items has not been carefully attended to, and correct. Don't give up at the first trial.

JOHN MILTON.

The author of one of the grandest poems in the English Language—Paradise Lost—was born in London, December 6, 1608. His father was a scrivener, or law-writer, in large practice; and his mother a lady from Wales. His father had a good knowledge of books, loved music, and was one of the best composers of the age.

John Milton's education began at home; afterwards he went to St. Paul's School, and in due course to the University at Cambridge. He got on so rapidly with his studies that it is said he was a "ripe scholar and a good one" before he was twenty-one years of age. His talent for poetry showed itself very early—"at the age of ten," says one writer; and his fond father was so proud of him that he employed Jansen to paint his portrait—a half-length in laced ruffles. From the time of his leaving Cambridge, John Milton resided with his father on an estate which the latter had purchased at Horton, in the county of Bucks. In 1637, on the death of his mother, he got permission to visit Italy, on a musical as well as poetical tour, to collect for his father the works of the great masters of one art, while he gained personal experience in the other by intercourse with learned persons there. "I had determined," says he, "to lay up, as the best treasure and solace of good old age, if God vouchsafe it to me, the honest liberty of free speech."

The next long stage in Milton's life was his being secretary to Oliver Cromwell, for which he had a very moderate salary.

In 1843 he married Mary, daughter of Richard Powell, Esq. of Forest Hill, in Oxfordshire. On her death he became blind, and married for the second time Catherine, the daughter of Captain Woodcock of Hackney.

After the death of Cromwell and the Restoration of Charles II., Milton was a marked man. But he was now poor and blind, and no one could pursue with violence an enemy cast down by fortune and disarmed by nature.

Milton now turned the whole force of his early poetic genius to the working out of the dream of his boyhood—the writing of a grand poem.

Thus, till his sixtieth year, so little impatient was he of securing fame by that very gift on which he most valued himself, that the whole of his published poems scarcely made a hundred pages of print.

Now he felt—poor blind man!—that it was

within him, so his daughter wrote while he composed.

Paradise Lost was published in 1667; Paradise Regained and Samson Agonistes, a Tragedy, three years afterwards. These, with L'Allegro, Il Penserosa, Lycidas, Comus, the Sonnets, with a few juvenile poems in Latin, Italian and English, completed his poetical works.

He died peacefully, in 1674, at his house in Bunhill Fields; and was buried next to his father, in the chancel of St. Giles', at Cripplegate.

One moral which young readers may draw for themselves from John Milton's life is—that youth is the time for book-learning and industry; and then whatever may be the troubles or reverses of after-life or old age, a mind well-stored in early days can give consolation and cheerfulness, as the poet found, even when he was aged, poor and blind.

MISSPENT EVENINGS.

The boy who spends an hour of each evening lounging idly on the street corners, wastes in the course of a year three hundred and sixty-five precious hours, which, if applied to study, would familiarize him with the rudiments of almost any of the familiar sciences. If in addition to wasting an hour each evening he spends ten cents for a cigar, which is usually the case, the amount thus worse than wasted would pay for ten of the leading periodicals of the country. Boys, think of these things. Think of how much time and money you are wasting, and for what? The gratification afforded by the lounge on the corner or the cigar is not only temporary but positively hurtful. You cannot indulge in them without seriously injuring yourselves. You acquire idle and wasteful habits, which will cling to you with each succeeding year. You may in after life shake them off, but the probabilities are that the habits thus formed in early life will remain with you to your dying day. Be warned, then, in time, and resolve that as the hour spent in idleness is gone forever, you will improve each passing one and thereby fit yourself for usefulness and happiness.

LETTERS FROM BOYS AND GIRLS.

A Pleasant, Wee Visitor.

Uncle True:—Mamma reads me the letters from young Cousins in your paper every week. I am a little girl six years old; have never been to school; can read and spell and write a little. I have no brother or sister, but lots of pets. Four rabbits; a guinea pig, which I took to the county fair, and for which I received a first premium. Her name is Lady. I have a blue cat which weighs eleven pounds, a pet lamb and a shepherd dog. I wish you could all see my pets. Good-by.—Cora E., *Seneca Falls, N. Y.*

From Lena Crafte.

Dear Cousins:—I hope Uncle True won't scold when he sees another letter from me. I will not trouble him again. Walter P. wanted to know about the leap-year party. I will try and tell him. Of course, we went after the boys, waited on them, danced with them, and took them home. There were thirty-five couples, and *the girls paid the bills.* I should like to correspond with Gypsy Belle.

A Martial Cousin.

Mr. Editor:—We have taken your paper in our family ever since it has been published, therefore I think I have a right to be one of the Cousins, and hope this will not be thrown into the waste basket. I live on a farm, but am not much of a farmer. I attend school. I would like to attend a military school, at West Point or some other place.—C. H. W., *Corfu, N. Y.*

The Puzzler.

BIBLICAL ENIGMA.

I am composed of 60 letters:

My 14, 12, 8, 23, 16, 26, 29 a king of Egypt.
My 21, 56, 9, 20, 33 was a priest without God's order.
My 1, 8, 27, 55, 34, 37, 40, 4 a companion of Paul.
My 24, 11, 3, 14, 46, 6, 55 was put to death for Christ's sake.
My 58, 8, 19, 34, 2, 50, 10, 35 St. Paul's teacher.
My 13, 36, 31, 19, 40, 5 a man who was struck blind for speaking against the gospel.
My 7, 59, 53, 17, 8, 32 a woman who was raised from the dead.
My 15, 39, 48, 41, 18, 4, 50, 8, 24, 28, 22, 5 a book of the Old Testament.
My 44, 20, 55, 50, 30, 42 a book of the Old Testament.
My 14, 38, 45, 47, 53 a book of the New Testament.
My 25, 50, 57, 28, 31 a number.
My 49, 43, 53, 26, 60 a king.
My 52, 50, 24, 48, 50, 14, 51, 15, 4 chief ministers.
My whole is a verse in the Bible.

☞ Answer in two weeks. S. C.

MISCELLANEOUS ENIGMA.

I am composed of 15 letters:

My 8, 2, 11, 11, 3, 5 is a wicked person.
My 4, 6, 10, 1, 7 is to produce.
My 2, 13, 5, 9 is a musical instrument.
My 14, 15, 10, 11 is money.

My whole is a range of mountains in America.

☞ Answer in two weeks. Virginia.

PUZZLER ANSWERS.—Oct. 28.

Hidden Fruit.—1, Plum; 2, Currant; 3, Persimmon, 4, Lime, 5, Fig; 6, Date; 7, Apple; 8, Watermelon; 9, Bread-fruit.

Geographical Enigma.—Lyons, Wayne County, New York.

Miscellaneous Enigma.—William Shakspeare.

Double Acrostic.—Primals, Luzon; finals, Sunda.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

Having a few choice plants now growing in the Rural's Experimental Grounds, which we think would be desirable to some of the lady readers of the Rural New-Yorker, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.00 for the two, may select any two of the following-named plants and a paper of the seed of the Molucca Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory or garden. Its growth is rapid—small plants attaining the hight of five feet during the summer months. In the fall it may be cut back to any desirable size and potted for the winter, when it will quickly recover its symmetry and resume its ever-blooming habit. Its quick and exceeding popularity is a sufficient guarantee of its merits.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is as yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class. It is difficult to select a more attractive plant than Marie Lemoine when freely blooming. Every truss is in itself a bouquet. The leaves are large, zonoloss, vigorous. The plant is compact and, like *Abutilon Boule de Neige*, is invaluable, either for the conservatory, window or garden.

Hydrangea paniculata grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It has stood 26° below zero unharmed. It begins blooming in early August, continuing until after hard frosts. The thyrses of flowers, first greenish-white, then white, then rose, often measure a foot in length and twenty inches in circumference. Every stem being thus terminated, the striking appearance of an entire plant may be conceived. There can be no doubt that this is one of the most valuable of all perfectly hardy shrubs.

Variegated Ampelopsis or *Vitis heterophylla variegata.*—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green, much as *Abutilon Thomsoni* is variegated with green and yellow. From its racemes of flowers are formed fruit as large as currants, each one of which is a different color in shades of claret, azure-blue and green. These berries, which are first as soft as a currant, become finally as hard as bullets.

The pretty stems are also variegated, green, whitish and rose. The roots are perfectly hardy, and the vine's growth so rapid that it will cover twenty-five feet square in a season. For conservatory walls or pillars, for trellises or rockeries, it cannot fail to please. It has been growing in the Rural Experimental Grounds for several years without the least protection.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the singular Shell Flower, an account of which and an engraving were given in the Rural of Aug. 17, p. 117.

News of the Week.

HOME NEWS PARAGRAPHS.

The Baptists of Michigan have added 2,500 to their number this year.

A Washington girl, Estella Hutton, carried arsenic in her pocket for a month, with the avowed intention of swallowing it when she got ready. A few days ago she put her determination into effect, and the dose quickly killed her.

The Sioux practice a mode or healing which is almost similar to the Turkish bath. As early as 1680 Father Hennepin was cured of a fever by the Minnesota Indians by sweating in an an air-tight earth-oven, covered with buffalo skins and heated with red-hot stones.

The name Hell Gate is older than the Dutch settlement of 1613. In a very ancient map of this locality, found in the library at Munich, Manhattan Island is represented as covered by Mohicans, but Hell Gate is indicated in the East River.

The studies prescribed by law for the Illinois public schools are orthography, English reading, writing, arithmetic, English grammar, geography and United States history. A pupil refused to study bookkeeping and was expelled. The father sued, recovered damages, and the Supreme Court sustains the verdict on the ground that a study of the prescribed branches cannot be enforced.

Du Sommerard denies that he wrote the objectionable letter, but it is alleged by many French exhibitors at Philadelphia that he did, from the first, all he could to break down the Exhibition, and that he succeeded in dissuading the proprietors of the Creuzot foundry, one of the largest in the world, from sending their superb products to Machinery Hall.

In the Vermont Legislature, now in session, it has been voted to reduce the Treasurer's salary 25 per cent.—to $1,500 a year, without clerk hire. Other salaries are to be scaled correspondingly.

The farmers of Wyandotte Co., Kan., having been for several months past annoyed by horse thieves, appointed an extermination day, hanged two of the culprits, and drove the rest out of the region.

Mrs. Hardy's paraffine mold trick has again been exposed in Boston. An investigator slyly put coloring matter into the pailful of paraffine from which the spirits were supposed to make the mold, yet the mold came out as white as usual.

It is proposed to introduce round playing cards, as being more easy to manipulate than the time-honored square-shaped, originally invented for the amusement of a sick French king. Instead of having the suits merely colored black and red, they are to be red hearts, green diamonds, black spades, and yellow clubs.

St. Louis has a new Asylum for the Reformation of Drunkards. It is said that the first patient in a similar institution in Chicago is now a Supreme Court Judge in Wisconsin.

The Boston Journal says that the Rev. Doctor Storrs was offered by a New York millionaire a handsome furnished residence as a gift if he would become pastor of the Brick Church.

Savannah physicians are accusing each other of unwise treatment of patients during the yellow fever epidemic.

A special to the Pioneer Press says that Gen. Miles, commanding the troops on the Yellowstone, after fighting, defeating and pursuing Sitting Bull and the confederated tribes under him, Oct. 27 accepted the surrender of 400 lodges of Indians belonging at the Cheyenne agency. The tribes surrendered five of their principal chiefs as hostages as guarantee of their faithful compliance with the terms of the capitulation. These bands are to go at once to the agency, where upon their arrival they will submit to the requirements of the Government. The Indians held as hostages left the same evening for St. Paul under the charge of strong guards.

Maj. Gen. Giles A. Smith died at Bloomington, Ill., Nov. 5.

The total number of interments at Savannah, Ga., Nov. 4, was nine, of which six were from yellow fever.

New York City is threatened with a water famine.

Boston has a Coaching Club. One coach so far.

Gov. Hartranft has appointed the 30th inst. as Thanksgiving.

A delegation of 100 Sioux Indians has gone to the Indian Territory to look for a reservation.

The Centennial Judges have decided to return to the original system of awards.

Johanna Turbin, a colored woman, was sentenced in the Washington Criminal Court to be hanged on the 29th of December for murder.

The number of postal cards issued during the month of October was 23,116,000, an increase of 2,977,500, or nearly 15 per cent. over the issues of October of last year.

On board the vessels of the whaling fleet recently abandoned in the Arctic Ocean, were 12,034 barrels of whale oil, 199 barrels of sperm oil, 61,100 pounds of whalebone, and 43,000 pounds of ivory

Tweed has not arrived yet.

Railway accidets are becoming epidemic. A collision occurred on the Louisville, Lexington and Cincinnati Short Line Railroad, near Peewee Valley, between a wild engine and an express train bound south, killing the engineer of the wild engine and his fireman. James Loman, express messenger, suffered a fracture of the left leg. A passenger train going west on the Ohio and Mississippi Railroad collided with a freight train near Shoals, Ind., killing the engineer and fireman. Some of the passengers sustained slight injuries, but none were seriously hurt. Nine cars and a locomotive were precipitated through a bridge a distance of thirty feet on the Baltimore and Ohio Railroad two miles east of Moundsville. The engineer was killed, and an unknown man on the engine was seriously injured.

FOREIGN NOTES.

At the recent convention of the Oriental Congress at Marseilles, Mons. De Lesseps, alluding to the submarine tunnel between France and England, and the creation of a sea in the desert of Sahara by an influx of Mediterranean waters, spoke of the projected grand Central Asia line of railway to unite Europe and Asia, by running to Peichauer in Anglo-India. He said that the scheme had received the approval of the Russian Emperor, and that the preparatory surveys would soon be completed. The railway outpost from Europe is now Orembourg, upon the river Oural, in Asiatic Russia, and the line in question will reach Peichauer by way of Samarcand. Between this latter point and Orembourg there are numerous large towns, notably, Tashkend, with a population of 150,000, but between Samarcand and Peichauer the country is very sparsely settled until Indoukouch, the ancient Indian Caucasus, is reached. The work is stupendous, but offers far fewer engineering difficulties than were required for cutting the Isthmus of Suez. This work required the invention of new instruments.

A boa constrictor, eight feet long, was captured a fortnight ago in the hold of a ship that arrived at Greenock, Scotland, from the West Indies.

The nickel coins struck in Germany under its new law represent a total value of between ten and eleven million dollars. This is the maximum figure allowed, and minting has been suspended.

There is said to be an old gentleman in England who has found the true elixir of life to be the food of infancy. He always has five wet nurses "on tap," and grows "fat and well liking" as he verges on centenarianism.

The Russian iron-clad squadron will winter in Italian waters in order to be ready to proceed to the East in case of need.

The election of Deputies has taken place in Italy; as far as heard from the Progressists carried 141; the Moderates, 28.

The Spanish Premier declares Spain will hold Cuba at any cost.

In France, the Government has compromised on the Amnesty bill.

In Turkey, French and Italian commissioners are settling the limits of the belligerent armies.

A pamphlet on "Bulgarian Horrors, the Question of the West," dedicated to the Right Hon. W. E. Gladstone, M. P., &c., has just been issued in London.

The Mincing Lane markets have been only slightly affected by Eastern affairs.

The Consular Commission at Mostar has been dissolved.

The Turks are charged with burning the house of the Austrian Consul at Serajevo, Bosnia.

Gen. Martinez Campos has arrived in Cuba.

Turkey has agreed to an armistice for two months from the first inst.; the Servian and Turkish armies are to retain the positions they now hold.

Great damage has been done by inundations in Cuba.

The King of Siam recently opened a new mint at Bangkok with a singular ceremony. At 5 P. M. he repaired to the upper hall and lighted sacred tapers and then the priests worshiped for two hours. The next morning he relighted the tapers and a high priest recited the five commands. These are:—Do not kill, do not steal, do not commit adultery, do not speak falsehood, do not drink strong drink. The King sprinkled with sacred water the new mint machinery, and with his finger rubbed flour from a consecrated cake on parts of the machinery.

Cadet Philippot, of the French military school of Saint Cyr, has been condemned to two years' imprisonment for stealing money and other valuables from his fellow cadets. He is a natural son, and his half brother, legitimately born, and at the same institution, was abundantly supplied with pocket money by his father, while he received nothing. He bore the neglect and the privation for a year, and then became desperate.

The novel which George Sand wrote some years ago will probably be published in a short time. The work is said to turn on the life and adventures of the student Staaps, who attempted to assassinate Napoleon after the battle of Essling, and who belonged to the Tugend-Bund, or Association of Virtue. That it should have been impossible to publish a book on such a subject under the Second Empire is easily conceived, nor would it have been popular, except among the Radicals, directly after the late war.

The celebrated old Paris prison of St. Pelagie is to be demolished. It was built in 1635 as a convent for penitent women and turned into a prison in 1790. Madame Beauharnais, afterward the Empress Josephine, and Madame Roland, were both incarcerated there during the reign of terror. The latter wrote her *Memoirs* there before going to execution. Under the restoration, the poet Berenger was one of its inmates, on account of his audacious attacks on monarchy. Under the government of Louis Philippe, Barbes was a prisoner there, and, during the Commune, Chandey, who fell by the bullets of the Federalists, crying, "Vive la Republique!"

The Pall Mall Gazette, in comparing the most formidable of the Russian ironclads, the Peter the Great, with the British Dreadnaught, says that if the former can average twelve knots, her designers may think themselves lucky. The Devastation steamed from Malta to Smyrna in 48 hours, at the rate of 14½ knots an hour; in point of armament and thickness of armor plate, the vessels are nearly alike, each carrying four 35-ton guns. The Thunderer is more powerfully armed with two 38 and two 35-ton guns, and would be still more formidable. The Dreadnaught is larger than the Peter the Great, carries four 38-ton guns, is faster than either of the others, and probably the most dangerous ironclad afloat at the present time.

Gen. Michael Grigorievitch Tchernayeff Commander-in-Chief of the Servian forces, is a thorough Panslavist, an able author, and experienced soldier. He was born in 1828, and graduated from the Military Academy of St. Nicholas in 1851, and was identified with all the important movements of the Russian army on the Danube during the Turkish complications that broke out in 1852. In 1862 he was appointed chief of staff of the army operating against the Circassians; in 1864 became Major-General, and in the following

year was appointed Governor-General of the province of Turkestan, which he had conquered. He was recalled from command through diplomatic representations by England, but was pensioned with full rank and pay, and after a rest of six months was restored. In June, 1875, he asked to be retired, and upon receiving the permission he offered his services to Servia in the interest of the Panslavic party. Prince Milan hesitates to dismiss him, as the Minister of war demands, because he represents so closely the Sovereign of Russia himself.

SEMI-BUSINESS PARAGRAPHS.

FRANK MILLER'S LEATHER PRESERVATIVE and Water Proof Blacking received the highest and only award at the Centennial Exhibition.

THE RURAL NEW-YORKER wants good local agents. Address RURAL PUB. CO., 78 Duane St.

FRANK MILLER'S HARNESS OIL received the highest and only award at the Centennial Exhibition.

INQUIRIES FOR ADVERTISERS.

[OWING to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents," so that each inquiry will appear under its appropriate head, either in "Inquiries for Advertisers," or "Answers to Correspondents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers, and while we shall not hesitate to give our reasons for excluding bad or doubtful advertisements, all such other matter will be admitted as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want, and the want is indicative of its need.]

H. R. M., Allegany Co., N. Y., wants a small Steam Engine for a cheese factory.

R. K. B., Niagara Co., N. Y., wants some one to advertise Percheron or Clyde Draft Stallions.

H. Y. M., Fulton Co., N. Y., wants a good Gold Watch. We refer him to the advertisement of QUNICHE & KRUGLER, in this issue, who sell an excellent article.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 4, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	100,300	Molasses	1,231
Whisky	2,437	Rice, bbls	1,510
Corn meal, bbls	4,425	Cut meats, pkgs	16,040
Corn meal, bags	770	Lard, pkgs	8,009
Wheat, bush	618,370	Tobacco, hhds	963
Corn, bush	652,800	do. pkgs.	4,335
Oats, bush	292,370	Butter, pkgs	29,785
Rye, bush	77,510	Cheese, bxs	40,075
Malt, bush	5,375	Cotton, bales	52,934
Barley, bush	357,198	Rosin	11,414
Beans, bbls	6,890	Spts. turp., bbls	1,747
Grass seed, bush	23,310	Dried Fruits, pkgs	5,365
Beef, pkgs	3,750	Eggs, bbls	9,547
Wool, bales	2,773	Peanuts, bags	1,433
Hops, bales	2,350	Leather, sides	33,765
Pork, bbls	910	Sugar, hhds	9,010
Tallow		Oil cake	—

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible: mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the insides of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival here of summer items on Saturday.

BEANS AND PEAS.—Exports beans past week, 366 bbls.; since Jan. 1, 50,317 do.; same time last year, 23,011 do. The receipts of beans are fair, but they strike a lightly-supplied market, and all grades feel the improved tone of prices with the advancing season. The demand is not large at the prices, but holders do not wish to fill heavy orders, even at the advance we quote. Poor quality, to some extent, reduces the offering, as buyers will not take any but prime, handsome stock, either for export or home use. Green peas are firm—have been a shade above $1.55. Canadian peas quiet and unchanged. Exports of peas past week, 26,300 bush.

Beans—New medium, $1.75@1.80; do. marrow, $2.30@2.35; do. pea, $2.15@2.20; white kidney, $2.35@2.40; red do., $2.20@2.25; Old Beans—Medium, prime, $1.55@1.60; other, $1.30@1.40; other, $1.90@2; pea, prime, $1.80@2; white kidney, prime, $1.75@2; red do., prime, $2.10@2; other, $1.50@1.90; black, $2.70; Canadian peas, new, ₩ bbl., tree, $1.12@1.14; do., bulk, 93@96c.; green do., new, $1.50@1.55; do., S. B. E. peas (2-bush. bag), $2@2.25.

BEESWAX.—Export trade is very bright, and supplies are fair, giving easy prices. Western and Southern quoted at 31½@32c.

Exports past week, 1,780 lbs., since Jan. 1st, 61,685 do.; same time last year, 73,182 do.

BROOM CORN is in very fair supply and favoring the buyer.

Quoted at 7@8c. for short green brush, 6½@7½c. for green hurl, 5@6c. for medium green, and 3@4c. for red and red-tipped.

BUTTER.—Receipts are larger and the quality of bulk butter shows a marked improvement. With a good supply of useful and desirable tubs choice pails and creamery have less precedence. Medium or summer grades of State have no strength, in fact the inside line of rates is all they will bear for wholesale style of business. Western butter too begins to show better average grade, and the call for State possessing that often sought for combination of low price and good quality now supplies itself largely from Western dairy tubs. Roll butter does not arrive in uniform good quality. The export demand for Europe, though not really revived, shows a tendency to become stronger. Some parcels of Western have been taken at 18@21c., though the buyer has insisted upon having quality in his favor. A few lots of State Welsh at 20c. have been included in the export purchases. The following table of receipts and exports from Jan. 1st to date make an encouraging showing for our export business:

	Receipts, pkgs.	Exports, dtk.
June 1, '76, to Nov. 1, '76	631,061	78,131
June 1, '75, to Nov. 1, '75	495,886	18,828
June 1, '74, to Nov. 1, '74	459,227	38,787
June 1, '73, to Nov. 1, '73	498,815	18,093
June 1, '72 to Nov. 1, '72	330,557	28,258
June 1, '71, to Nov. 1, '71	322,412	43,200

Exports past week 3,459 pkgs.

We quote:—Choice pails, 34@34c.; prime, 32@33c.; poor to good, 24@30c.; creamery pails, choice, 35@37c.; good, 33@34c.; sweet cream pails, 30@35c. State firkins, choice, 29@30c.; fair to good, 25@27c.; do. half firkin tubs, choice, 32@33c.; fair to prime, 20@30c.; do. Welsh tubs, choice, 31@33c.; other, 24@28c.; inferior State, 15@19c.; Western creamery, choice, 31@33c.; other, 31@33c.; do. firkins, best, 21@22c.; other, 14@15c.; dairy tubs, choice, 25@27c.; other, 15@18c.; factory choice, 22@24c.; other, 14@18c.

State dairies quotable at 30@32c. with full tubs Welsh tubs, dairies, 26@31c.

State firkins dairies 25@30c. Welsh tubs dairies, 26@30c. Roll butter, fair to prime, 23@26c.; do., poor, 20@21c.

The Dundee creamery in Illinois, took the first prize at the Centennial.

CHEESE.—This market is still depressed and dull, more so than has been known for a number of seasons. There is nothing encouraging in the English advices, and this trade is confined to small lots to replenish assortments, aside from a few parcels which are being shipped on owners' account. The average run of fancy factories will not exceed 13c., but there are special lots which run up to 13½c. Anything under fancy is merely nominal in price. We quote:—Fancy factory at 13@13½c. for fancy white and colored; do., job lots, 14c.; good and prime, 11½@12½c.; fair, 9½@11c. State farm dairy, fancy, 11½@12½c.; good to prime, 10½@11c.; fair and good, 9@10c. Western factory, good and prime, 11@12c.; fair lots, 9½@10½c.; do. skeddar, choice, 12½@12¾c.; do. flat, choice, 13½@13c.

Exports for the week, 10,574 boxes.

Comparative receipts and exports from June 1:

	Receipts, pkgs.	Exports, lbs.
June 1, '76, to Nov. 1, '76	1,457,771	64,121,812
June 1, '75, to Nov. 1, '75	1,788,151	72,800,996
June 1, '74, to Nov. 1, '74	1,534,833	75,304,003
June 1, '73, to Nov. 1, '73	1,498,969	70,526,069
June 1, '72, to Nov. 1, '72	1,203,389	58,721,058
June 1, '70, to Nov. 1, '71	1,113,375	51,767,059

COTTON.—The very active market in Liverpool and the larger requirements in consequence causes a buoyant feeling here and prices much higher.

The latest quotations are:—October, 11 23-32c.; December, 11 25-32@13 1-16c.; January, 12c.; February, 12 3-16@13 7-32c.; March, 12 13-32c.; April, 12 19-32@12¾c.; May, 13 25-32c.; June, 12 15-16@13 31-32c.; July, 13 1-16@13 3-32c.; August, 13 5-32@13 3-16c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9 9-16	9 9-16	9 9-16	9 9-16
Strict ordinary	9 15-16	9 15-16	9 15-16	9 15-16
Good ordinary	10 7-16	10 7-16	10 7-16	10 7-16
Strict good do	10 11-16	10 11-16	10¾	10¾
Low middling	10 15-16	11 1-16	11 3-16	11 3-16

	Stained.			
Good ordinary	9 5-16	Low middling	10	5-16
Strict ordinary	9 15-16	Middling	10	13-16

ESSENTIAL OILS.—The market for peppermint feels the influence of better demand and prices abroad, and prices are higher. Other items weak and nominal—all in overstock.

Oil peppermint, full glass, $3.50@2.50; spearmint, $1.50; wintergreen, $2.50; wormwood, $1.50; sassafras, 45c.; tansy, $1.75.

EGGS.—Fresh eggs are a trifle higher. The demand has been good enough to warrant stiffer prices, but a large arrival of limed, added to the regular receipts, deprives buyers of much of their independence. No large trade in limed, as yet.

Near points, 29@30c.; State and Penn., 28@29c.; Western, prime, 27½@28c.; do. other, 27c.; Canadian, 27@28c.

State limed, 20@21c.; Western, do., 18@21c.

FRESH FRUITS.—Exports of apples, past week, 12,119 bbls. Receipts of apples continue heavy, but with a steady local trade and a heavy export demand, prices are stronger for choice table or retailing stock. The commercial offering of pears is small, and this week will wind up all but California. The latter have steady and large additions. A few good Boston pears are quoted $3.50@4 per box. There is a good trade in California pears, some buyers purchasing to hold. Louisiana oranges are in good supply; quoted at $5@6.50. Florida oranges are in market at $4@5 per box of about 250; boxes sell better than barrels. Grapes are higher. Cranberries are rather more active. Peanuts have declined. Hickory nuts and Chestnuts in fair demand.

Apples, State, ₩ bbl., fall and prime red, $1.75@2.00; winter, $1.37½@1.50; mixed, $1.12½@1.25; good to fair, 60@75c.; common open heads, 50@75c. Pears—Duchess, $6@12; Seckel, Vicars, 5@7; W. Nelis, $5@7; cooking, $3@4; Lawrence, $6@8; California, Duchess and B. D'Anjou, $4 ₩ box; B. Clairgeau, $1.50; W. Nelis and E. Beurre, $4. Quinces, ₩ bbl., $8@12. Cal. Quinces, $3@4 ₩ box; Cranberries, crates, $4.62½@5.00; eastern prime, $9.50@10; N. J. $7.75@8.75, for good to prime. Grapes—Catawba, ₩ lb., 9@10c.; Isabella, 6@7c.; Cal. Tokay, $6 ₩ 30-lb. case; Malaga and Muscat, $5@4 do.; Black Prince, $3@4. Chestnuts, ₩ bush., $2.50@3.00. Hickory nuts, $1.50@2.; Va., fancy, $1.40; other, $1.30.

FOREIGN DRIED FRUITS.—Layer raisins, $2.15 ₩ bbl., do. half boxes $1.25, do. quarter boxes, 60@70c. New Sultana raisins 12c. New loose Muscatel $2.15@2.25. New Valencia raisins, $9¾@10. New currants 6½@6¾. Turkish prunes, 5½@6c. for old and 9½ for new.

DOMESTIC DRIED FRUITS—The arrivals of apples have been large; a good many lots are being steadily taken for shipment, but this trade is prompted by easy prices; Peaches are scarce and favor the sellers. Blackberries are very firm.

Apples—State, sliced, 7¾@8½c.; do., quarters, 7@7½c.; Southern sliced, new, 6@6½c.; choice do. 7@7½c.; fancy, 9c. do., new quarters, 4¾@6c., the latter for repacked; Western quarters 6½@6¾c. Blackberries at 8½c. Peeled peaches, new, 15@18c.; unpeeled peaches, halves, 9@11c.; do. quarters, 8½@9c. Raspberries, 26@28c. Cherries, 17½c.

Exports past week 2,000 bbls. dried apples; since Jan. 1, 12,875 do.; same time last year, 10,550.

FLOUR.—Export trade is very light, the position of affairs abroad giving no encouragement to buy ahead of actual requirements for prompt use, and prices are unsettled, favoring the buyer. We quote sales at $4.60@4.85 for poor to very choice superfine state; $5.20@5.30 for very common to fair extra do.; $5.35@5.45 for good extra do.; $5.50@5.65 for fancy do., and $5.70@7.00 for fancy to very choice extra: $4.60@4.85 for superfine Michigan, Indiana, Iowa, &c.; $5.20@5.40 for shipping extra do., the inside price for interior, and $5.45@5.55 for choice to very fancy extra do.; common to choice white wheat extras, $5.60@6.75; fancy do. $7.50@8.00; winter wheat, good to choice family $6.50@6.25; round-hoop Ohio, $5.20@5.35, and trade brands of do. at $5.40@7.00; St. Louis, $5.30@6.50 for common to fair extra, and $6.55@8.25 for good to very choice; Minnesota "straight" at $6.50@7.40, and patent at $7.50@9.50; unsound stock at from $3.25@5.00; city mill extra for West Indies at $6.15@6.35; do. English brands, $5.30@—; do. trade and family $7.00@8.50; No. 2 at $3.40@4.40. Buckwheat flour is in fair demand at from $3.35 to $3.75 ₩ 100 lbs. Corn meal has fair inquiry at $2.90 to 3.15 for yellow Western. Pennsylvania and Jersey, and $3.40 for Brandywine.

GRAIN.—The wheat market was probably never so dull as at present. It is almost impossible to get shippers to operate unless at a decided decline, thus on account of the quiet market on the other side and the relatively lower rates there. New No. 2 Chicago spring, $1.25@1.26; new No. 3 Milwaukee, $1.23. Rye dull, at 72@75c. for Western and 86@88c. for Jersey, State and Pennsylvania. Barley is weak, with a large supply; No. 1 Canada quoted at $1.15@1.18; No. 2 do. at $1.08@1.10. Of malt, good Canada West sold at $1.20; Canada East at 95c. Corn is in liberal supply, in close export demand and lower; mixed Western at 58@60c.; Western yellow, 60c.; white Western, 59½c. Oats are active at 32@48c. for mixed Western and State, and 35@49c. for white do.

HAY AND STRAW.—There is a very good business in shipping hay and this grade holds to steady prices. Prime hay is rather dull. Good long rye straw is wanted at prime rates.

Bale hay 60c. for shipping; 70@90c. for retail qualities; clover, 55@65c.; salt, do., 50@60c. Straw quoted at 75@80c. for long rye; 50@60c. for short rye, and 45@60c. for oat.

HIGHWINES are quoted at $1.12@1.12½

HONEY.—Market quiet at 15@20c. for for White Clover comb in glass, Dark and Buckwheat, 10@14c.

HOPS.—Exports for the week, 1,507 bales; those include parcels that have been brought in the interior on direct consignment. The market has been quiet. Medium and common grades are pressed for sale and at easier prices, but choice lots are held firmly. The advices from Germany show that a preference is given there for American hops, and the trade here anticipates that the requirement will be sufficient to support their position.

New Yorks, good to choice, new	31 to 36
New Yorks, low to fair, new	25 to 32
Eastern, new	25 to 32
Yearlings	10 to 20
Olds, all growths	4 to 8
California, new	35 to 38

LEATHER.—Hemlock sole is active; manufacturers especially buy freely; prices are higher; for light, 20@22c. for middle, 23@25c. for heavy, 24@27c.; 20@22c. for good damaged.

POULTRY AND GAME.—Indian summer helps not the Poultry trade. Losses have been heavy on very many demand lots; a good many Western parcels have not even paid freight, with such treacherous matter it is difficult to give quotations of any stability. Chickens spoiled in appearance have sold at 4@8c. and turkeys 5@10c. The following are the closing rates for stock in good condition.

Turkeys, N. J., 13@17c.; State, 12@16c.; Western, 11@15c. Chickens, dry-picked, 12@15c. N. J. chicks, 12@18c.; State, 11@14c.; Western, 11@11c. Ducks, N. J., 14@17c.; State, 12@16c.; Western, 12@15c.;

Geese begin to come in quantity quoted 12@14c. for fair to good; poor order, 5@9c. Live poultry has a fair demand as city killers have to supply urgent wants of prime.

New Jersey turkeys, 13@14c. ₩ lb.; Western, 12@14c. N. J. fowls and chicks, 12@13c.; State and Penn., 10@11c.; Western, 10@11c., roosters, 8@9c. Geese, N. J., ₩ pair, $1.75@2; Western, $1.37@1.62. Ducks, N. J., ₩ pair, 81@87c.; Western, 50@65c. Live pigeons, ₩ pair, 25c.

We quote only prime sound stock. The weather has been severe upon birds coming from remote points; There is considerable hunting in neighboring haunts and the market obtains some supplies of fresh in that way. Venison is running poor. Rabbits quite abundant.

Wild ducks, mallard, ₩ pair, 40@45c.; canvas-back, $1.50@1.75; red-heads, 30@35c.; teal and other, 25@30c. Quail, ₩ doz., $1.50@2.00. Partridges, ₩ pair, 65@75 for State, 50@60 for eastern, 25@50 for western. Grouse, ₩ pair, 80@90c.; Hare, ₩ pair, 50@60c. Rabbits, 30@40c. Venison, whole, 9@11c., saddles, 13@15c.; short, 13@15c. Woodcock, 40@55c.

PROVISIONS.—Pork is rather scarce, as well as bacon, and firm rates held; but lard has been rather pressed for sale and weak in price. Mess pork quoted at $17.12½; Eastern prime, $13.50@14.50; mess pork for December and January deliveries quoted at $16. Bacon at 8½c. for long clear and 9½c. for short clear. Western steam lard at $10 for spot and $9.90 for November, $9.87½ for December, $9.95 for January. Stearine at 10½c. for prime. Beef hams at $20 for choice Westerh. Beef, barreled lots quoted at $8@10 for plain mess, $10@11 for extra mess, $13.50@14 for packet. Tierced quoted nominally at $19@21 for new prime mess and $21@23 for new India mess. City extra India mess at $27.

SEEDS.—Grass are hard to sell and decidedly lower; prime clover is offered at 14½c., and timothy $1.90@2. Rough flax very firm at $1.90.

SUGAR (Refined) quoted at 9¾@12½c. for soft yellow; 10¾@10¾c. for white, and 11¾@11¾c. for crushed, powdered and granulated.

SUNDRIES.—Feathers quiet at 55@58c. for live Western; 40@50c. for mixed. Ginseng, $1.10@1.20. Cider unchanged—8@. for large packages, 10c. for kegs. Essential oils are not quotably changed.

TOBACCO.—Export demand has been active, but current prices are steadily held. We quote:

KENTUCKY LEAF—NEW CROP.

VEGETABLES.—Exports of potatoes past week, 7,555 bbls.; of onions, 446 do. Supplies of potatoes begin to be less oppressive and prices are in sellers' favor. Cabbages are advancing.

Potatoes—Peach Blows ₩ bbl. $2.50@2.75. Early Rose, prime, $2.62½@2.75; other, $2.25; Peerless, bulk, $2½@2.50; sweet, Del, $2.50@3; Va. $2@2.25. Cabbages, ₩ 100, $4@7. Marrow squash, ₩ bbl., 50@75c. New Russian turnips, ₩ bush., 75c.@$1. Onions—Yellow, ₩ bbl., $1.75@2.25; white, $2.75@3.; red, $1.50@1.62. Cauliflower, ₩ bbl.; $1.50@2.25.

WOOL.—The market at present is very quiet. The stocks, however, are so moderate that on certain grades, more especially fine fleeces stronger rates are made and confidence expressed generally. XX Ohio fleeces have been sold at 40@45c., XXX and picklock at 50c., X Ohio, 44@45c., No. 1 at 42@44c., No. 2 at 40@42c., XX State, Michigan, Indiana and Wisconsin at 40@42c., X do. at 40@42c., combing, 50@56c.

ROCHESTER, Nov. 4.—Flour steady; spring, $6.75; amber winter, $7.00; white winter, $7.50; double extra, $7.75. Rye flour quiet at $5.00. Wheat quiet; Milwaukee club, $1.20@1.30; amber winter, $1.15@1.25; white winter, $1.20@1.27. Oats, nominal at 38@40c. Corn quiet at 58@62c. Corn meal, $1.25@1.50. Butter, 25@27c. Cheese, 11@13c. Eggs, 20@23c. Lard, 12@13c. Apples, bu., 35@50c. Potatoes, bu., 70@80c. Beans, ₩ bu., 80@$1.60. Mess pork, $18.00. Wool, 25@30c. Hay, $10@12. Straw, $6@8. Timothy seed, $2.05@2.20; clover, $7.00@7.50. Mill feed strong at $14 for shorts, $16 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 25c. ₩ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Nov. 4, 1876.

THE cheese trade this week has been dull, and buyers hold back and insist that prices are too high. The bulk of sales range about ½c. less than for the previous week. Upward of 400 boxes of farm dairy cheese were on delivery, and sales were made at from 10 to 12½c., the bulk going at about 12c. Factories were well represented, the aggregate of offerings being nearly 9,000 boxes, mostly of the September make, which was generally considered of very fine quality. We quote sales as follows:—163 boxes at 12c.; 1,120 at 12½c.; 1,098 at 12¾c.; 350 at 13c.; 607 at 13¼c.; 93 at 53½c., and 735 on private terms, but which was reported at 13¼c. About 1,356 boxes were sent forward on commission. Quite a number of factorymen, after learning the state of the market, refused to sell, preferring to hold for the present. A large share of the September cheese is now shipped, and owing to the drought and the light crop of aftefeed, the October make of cheese will be much below the average.

Butter is coming forward in considerable quantities, the sales this week ranging from 25 to 27c. for ordinary farm dairies in Welsh tubs, and 28 to 29c. for fancy lots of creamery.

The weather is warm and pleasant, but cattle require to be fed rations from the barn, in order to supplement the feed obtained from pastures.

We have advices from abroad for the second week in October. Our London correspondent says that American cheese sells as landed, especially the finest brands, and prices tend upward. Fine English cheese is in good demand, but secondary is neglected. There is no change in Dutch cheese. We give prices as follows:

American, extra fine, 65@66s.; fine, 63@64s.; good, 56@60s.; secondary and low grades, 30@50s. English cheddar brings from 78@80s.; Wiltshire double, 60@76s.; Cheshire medium, 51@68s.; fine, 74@84s.; Scotch, 64@70s. Dutch cheese—Edams, 66@68s.; Gondas, 54@58c.; Derby shape, 60@65s.

Fine butter is scarce and sells at an advance of 6s. sterling the cwt. Secondary sorts are slow of sale. Fine American is asked for. We give quotations as follows:

Clonmels, 146@150s.; Corks, 143@155s.; Dorsets, 161s.; Jersey, 130s.; Friesland, 151s.; Normandy extra, 120@158s.; American and Canadian, 90@138s., ₩ cwt. Oleomargarine sells at 90@104s ₩ cwt.

BEEVES.—Trade on Monday last was steady on an unusually light run of fresh cattle. The quality of the herds was from rough grass-fed steers to smooth corn-fed steers. Prices were 6¾@10¾c. ₩ lb.; weights, 4¾@9 cwt., strong. Wednesday, trade very slow on an increased run of beeves, all of which were not sold off at noon. Prices were 7@10¾c. ₩ lb.; weights, 5¾@9 cwt. Thursday, sales slow at 6¾@10¾c.; weights, 4@8¾ cwt. Friday, the markets closed weak at 7@10½c.; weights, 5@8¾ cwt. From 51@57 lbs., net, has been allowed. Spanish herds, direct from the Plains, 6¾@8¾c. Native steers, grass-fed, 7@9c.; do. part corn-fed, 9¾@10c.; grade do., 10¾@10½c., with a few head at 11c. Dry cows, 8c. Oxen, 7@9c. Bulls, live weight, 3¾@4c.

MILCH COWS.—The arrivals have been so light that dealers have declined to give quotations.

VEALS AND CALVES.—Trade slow. Smooth quality veals at 7@10c. ₩ lb. Coarse grass-fed calves 4@4¼c. ₩ lb., also at $1.50@11 ₩ head. State veals, 7@10c. Pennsylvania do., 8@9½c.; Jersey do., 8¾@8¾c. State calves sold by the head. Western and Canadian, ₩ lb., as quoted,

SHEEP AND LAMBS.—Trade unusually dull. Monday, sheep, 4¾@5c.; lambs, 5¾@6¾c. Wednesday, sheep, $4@5.30 ₩ cwt.; lambs, 5¾@6½c. ₩ lb. Thursday, sheep, 4@5¾c.; lambs, 5@6¾c. Friday, sheep, 4¾@5¾c.; lambs, 5¾@6¾c. The markets closed weak. State sheep, 4@5¾c.; Ohio, 4¾@5c.; Kentucky, 4¾@5¼c.; Canada, 5@5¾c. Kentucky ewes, 5¾c.; Canada do., 5½c.; Jersey do., 4½@5c. State lambs, 5¾@6½c.; Ohio do., 6c.; Canada, 5¾@6¾c.

HOGS.—On live weight, sold at $5.57½@5.90 ₩ cwt., with one car load a trifle over 6c. ₩ lb., all quoted from Ohio. City dressed dull at 6¾@7¾c. Light pigs, 8c.

HORSE MARKET.—City trade steady in low-priced horses. Ninety head, poor quality, light harness horses sold at $10@105 ₩ head; general sales $62@95; 40 head, ordinary quality, light harness horses sold at $125@195; 6 ponies, $40@150; 10 roadsters, with fair trotting action, not warranted sound, chiefly aged, $200@250 ₩ head; 3 trotters, fair quality, $450@500 ₩ head; 7 pairs family carriage horses, $325@600 ₩ pair; 10 head brougham horses, coarse quality, $275@375 ₩ head; 2 pairs stylish carriage horses, $950@1,100 ₩ pair; 3 pairs choice quality heavy draft horses, $500@$600.

PERSONAL ITEMS.

AUSTRIAN officers speak many languages.

MRS. VAN COTT is evangelizing in Texas.

BEACONSFIELD, Disraeli's new title, is pronounced Beckonsfield.

MR. GOLDWIN SMITH and wife are to spend the winter in England and Italy.

G. WALTON JAMES will assume the editorship of the revived Enquirer at Richmond, Va.

KING KO of Borneo, is shortly due in London. His boar-leader is M. Prosper, a Frenchman.

THE Chicago Journal says Prof. Swing is the connecting link between religion and science.

THE walruses in the Acclimation Garden of Paris have been taught to say "papa" and "mamma."

M. DE GEOFROY, the French Minister to Japan, sailed with his family for Havre, Oct. 24, in the steamship St. Laurent.

MRS. H. J. BYRON, the wife of the well-known dramatic writer, died at Brighton, England, recently, in her 45th year.

VICTOR HUGO, says a correspondent of The Boston Gazette, is the stingiest of morials although he is worth more than $500,000.

Now that the plague is at an end in Savannah, it is proposed to furnish the overworked nurses and physicians free passes to the Centennial.

THE authors of "Ready-Money Mortiboy," "This Son of Vulcan," etc., are discovered to be Mr. Walter Besant and a Mr. Rice, both of whom are in this country.

MARY CLEMMER thinks that the amount of human life sacrificed to the Philadelphia Exhibition is enormous. She attributes this result to fatigue, bad water, improper food, and excitement.

A NEGRO witness in a trial the other day was asked what he was doing in a certain saloon at a certain time. He explained that he had gone there to "change his breff." The explanation was accepted.

AN Indiana man has expended $2,000 in a lawsuit over a yoke of oxen, and the suit is still in the courts. Strangely enough this man's name is Wiseman, but it is not what his lawyers confidentially call him.

THE life and adventures of the student Staaps, who tried to assassinate Napoleon after the battle of Essling, are the subject of a novel which Georges Sand wrote some time ago, and which will shortly be published.

THE great angler is to have a memorial bust of himself placed in St. Mary's Church, Stafford, wherein he was baptized. All the nobility and gentry of the town have conspired to do honor at this late day to the ancient Walton.

DR. WM. W. HALL, editor of the Journal of Health, recently fell dead in the street, a victim to the violation of the laws of health, of which he was such an active advocate. His disease was degeneration of the heart, caused by an overtasked brain.

"You haven't got such a thing as a pair of old trowsers, have you?" "No, my man," said the merchant, "I don't keep my wardrobe in my counting-house." "Where do you live?" rejoined Pat, "and I'll call in the morning for the old pair you've got on."

IT takes more grace and Christian charity than can be crowded into one human heart, to enable a woman to forgive a man who calls at ten o'clock in the morning, and comes stumbling around to the side door and finds it open, and looks right in and sees the house upside down.

QUEEN VICTORIA has done a just and kindly thing in giving a pension of $750 yearly to the widow of George Smith, the Assyrian scholar. There is one of the advantages of a monarchy; the widow of an American scholar, however distinguished and laborious, would starve if she had only official aid to invoke.

WHEN Thomas Nelsonas was asked on the revision of the Preston Parliamentary list of borough voters in England whether that was his right name, he said:—"No, my proper name is Thomas Hill Joseph Napoleon Horatio Bonaparte Swindlehurst Nelson." The vote was allowed, and the full name inserted in the register.

IT seems probable that the elephant will soon become extinct. According to a statement made at a recent meeting of the Paris Geographical Society, England imports annually 1,200,000 pounds of ivory, to obtain which it is necessary to kill 30,000 elephants. The total annual destruction of these animals is estimated at 100,000.

WHEN a Bishop at a public meeting in England asked Professor Huxley, sneeringly:—"Does the learned scientist really wish us to believe that he is descended from an ape?" the sharp rebuke was administered by Huxley, "I had rather be related to an ape than to a Bishop of the Church of England who can so misrepresent the votaries of science."

IN a communication to the French Academy of Sciences, M. A. Moret states that during a recent balloon ascent off Cherbourg with M. Durouf, they were surprised, at the height of 1,700 metres, to see the bottom of the sea in its minutest details, though the channel at that point must be sixty or eighty metres deep. The rocks and under currents were clearly visible.

WHEN the late James Lick was having his portrait painted for the California Pioneers, he noticed with chagrin that the artist was reproducing the wrinkles in his face with laborious fidelity. "I don't want them in," said Mr. Lick "But, Mr. Lick," replied the artist, "they are true to life—the wrinkles are in your face." "I don't care whether they are or not," returned the millionaire; "paint them out," and they were painted out.

MR. EUGENE SCHUYLER, Secretary of Legation and Consul-General of the United States at Constantinople, whose reports on the Bulgarian massacres have been so highly commended, is a son of Hon. George W. Schuyler, Canal Auditor of this State. Eugene Schuyler is a graduate of Yale, in the class of '59, and was several years Secretary of Legation at St. Petersburg.

THE Duc Decazes, whose resignation as French Minister of Foreign Affairs was announced and contradicted a few days ago, has a cold, aristocratic air, with clear blue eyes, thick eyebrows, and a good mouth, and greatly resembles an Englishman in manners and dress. He is a prompt, cool-headed business man, and has been engaged almost all his life in the diplomatic service.

A CARPENTER who was always prognosticating evil to himself was one day upon the roof of a five-story building upon which rain had fallen. The roof being slippery, he lost his footing, and exclaimed, "Just as I told you!" Catching, however, an iron spout, he kicked off his shoes and regained a place of safety, when he thus delivered himself: "I know'd it; there's a pair of shoes gone!"

THE New Orleans Picayune, in trying its hand at description, says:—"The modern city school girl goes along with a big tilter, a bustle, striped hose, hump-backed, carrying thirty-one different books, three slates, four copy-books, bottle of ink, pocket full of pencils and pens, seven dollars worth of pinchback jewelry, a mouthful of chewing-gum and thirteen red streamers dangling after her."

A.—"They say there's to be a war between Russia and South Carolina." B.—"Well, that'll draw us in, won't it?" A.—"No; Governor Chamberlain will see to that." B.—"Who's Chamberlain? this fellow that's going round making political speeches?" A.—"No; he's Governor of Cincinnati." This was an actual conversation on the car, and not a fancy sketch.—*Newburyport Herald.*

THE book of the Emperor of Brazil is to be called "Recollections of my Journey," and will be printed in Portugese, French, English and German. Wherever he traveled he took many notes on manners, customs, and countries, and what he has to say will probably have less of the amateur stamp than has most royal literature. He was especially kind in Portugal to various native writers of note, and indeed shows in every country that he is thoroughly familiar with its best literature.

OF the Princess Agnes Salm-Salm, now married to an English gentleman, Mr. Heneage, the St. John's (Quebec) News says:—She is a native of Phillipsburg, and daughter of Mr. William Joy, a mechanic of American descent. Her brother is a captain on one of the barges plying on the Richelieu. The Princess is now about forty years of age. She has a younger sister married to Colonel Johnson, United States Consul at Tampico. All this may be true, but if so it is odd that her maiden name should have been Leclerq.

THE custom in some post-offices of forwarding unpaid letters, and appealing to the receiver for repayment in a little poster pasted on the backs of the letters, was initiated in Newark, N. J. A benevolent gentleman saw a bundle of unpaid letters to foreign addresses, took pity on their far-away owners, and not only paid their postage, but for years afterward the postage of all such letters. He paid for the letters 20 years, including at the last domestic letters in his charity, and kept his name secret.

TWO hundred young men were collected for training as ushers at the coming Moody revivals in Chicago. They were selected for this duty by Rev. A. G. Truesdale, and when placed in file were a fine looking row. Handsome, fully up in the golden-stair business, religiously plump and contralto in voice. The same regulations that governed the squad in Philadelphia were to be adopted. So a detective looked in and along the line to find nine professional pickpockets and a noted "bugglar." He weeded these out and the others drilled.

AN American woman, Mrs. Susan Ellis Laura Smith, believing "that it is the duty of every member of the human family to devote their bodies after death to scientific examination until the principles of physiological science are thoroughly established," has willed her body to the Royal College of Surgeons of England, to be dissected immediately after death. She winds up her testament with the following clumsy but cheerful permission:—"I should also wish that if any of my friends should desire to have a remnant of my said body, they should be at liberty to do so."

IT is said that the late Mr. Peabody, with all his prodigality on works of benevolence, looked closely after his pence. He hated nothing more than the notion of being taken in, and it was rare indeed that any trickster could make that boast. On one occasion, when traveling in Ireland he was greatly annoyed at what seemed a very extortionate demand on the part of a car-driver, and he accordingly resented the attempt at imposition by giving the man his bare legal fare. After looking at the coin for a few seconds, Pat began to laugh. "Bedad," says he, "they may call you Mr. Paybody, but I call you Mr. Paynobody."

Implements and Machinery.

Centennial Year of American Independence,

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you examples of the Celebrated Watches, manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neurhatel. for INSPECTION and EXHIBITION. These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, fine Ruby Jeweled, set in Chatons, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

B. T. BABBITT'S BABY SOAP.

Only the purest vegetable oils used in its manufacture. No artificial and deceptive odors to cover common and deleterious ingredients. UNRIVALLED FOR THE TOILET AND THE BATH. Used in bathing children, will prevent eruptions, keep the skin soft and smooth, contribute to health, and prevent disease. Does away with all powders, chalk or other emollients. A certain preventive of *chafing, itching, &c.*, in babies, the causes of half the crying and crossness of babyhood. Worth ten times its cost to every mother and family in Christendom; packed in boxes of 12 cakes, of 6 ozs. each, and sent free to any address on receipt of $2.00, Address B. T. Babbitt, NEW YORK CITY.
☞ For Sale by all Druggists. ☜

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

A. M.—We do not think bulbs of Hyacinths or Tulips can be purchased in the spring. If kept out of the ground through the winter, they would be greatly injured from sprouting and many would decay. They begin growth as soon as severe weather has passed, so that florists and seedsmen would have but little time to collect and offer them for sale.

B., Newark, N. J.—The verses are:

"Come and trip it as you go
On the light, fantastic toe."

The author was MILTON.

E. C. Sherwood.—I should like to ask you if you could explain to me the cause of my Oleander's not blooming? It was cut back this summer for the first time. It formed three branches and budded, but the buds blasted. Was it because I did not keep it moist enough? ANS.—Very likely. Why does not our correspondent plunge it in the open ground for the summer? Oleanders do not suffer from being transplanted, and they form among shrubs or flowers, by their distinct foliage, a very pleasing relief.

B. H. C., Orleans.—Wrap the roots in damp moss and cover with oiled manilla paper.

Mat Smith, Cherry Valley.—Please tell in your paper the best way to raise hardy Phlox. ANS.—Sow the seeds now in boxes or pots of light soil. Some will germinate now—others not until midwinter, or even spring. They may also be sown in the open ground. They will then germinate in early spring, but few will bloom the same season.

M. W.—The perennial Phlox is variable in its time of germination. The seed should be sown at once. Some will germinate in ten days—some will require two months, or even more. Do not, therefore, throw aside the pots or boxes in which they are planted. All those that germinate before May can be relied upon to bloom before frost.

S. B. W.—The "splint" on the mare's leg is doubtless the cause of lameness. These splints are sometimes very painful, and the animal will go lame when traveling on hard ground. Apply some cooling lotion to reduce inflammation and soreness, giving the animal rest during treatment. When the heat and soreness have subsided, apply a blister to the splint; then bathe with the lotion until healed. In some cases the cure will be speedy; in others repeated blistering is necessary.

An Old Subscriber.—Please answer the two following questions:—1. How shall I plant Horsechestnuts and when? I bought one quart and planted them in the spring, but did not get one to grow. The nuts were good. 2. How shall I make lager beer and how long will it keep? ANS.—1. The reason why the Horsechestnuts failed to grow was because they had become too dry through keeping them over winter. All such large, coarse nuts will not withstand much drying. They should either be planted in the fall, soon after gathering, or be mixed with earth or clean sand, and then buried out-of-doors, where they will be kept moist and cool until spring, when they should be sown. If you will try this method of keeping, success is pretty certain. 2. We are not brewers and know nothing practically about making lager beer.

E. S.—Will "Frolic" or some one else give a picture of a comfortable, neat-looking hood for an old lady who does not find a "cloud" sufficient to keep the head warm?

Several Correspondents.—Many of our friends who request seeds under the "Little Announcement" ask how to treat Phlox and Pelargonium seeds. We have already answered such questions more than once. Those who have sunny windows or conservatories may sow at once. Sow Phlox one-eighth of an inch deep in light soil placed in boxes or pots well drained. A small proportion will germinate in ten days or so; the rest varying from three weeks to three months Have patience, therefore, and all will bloom next summer or fall. Much the same may be said of Pelargonium seeds, though a larger proportion will germinate at once. Box them lightly and water rather sparingly while the seeds are in leaf. Those which germinate within a month will bloom in early summer.

Young Farmer—We will try to tell you all about the Jerusalem Artichoke in our next number, with several illustrations.

Arboriculturist.—Young seedlings from the forests may now be taken up and the tops pruned off, if need be, and then the roots heeled in for protection during winter. This is, perhaps, the best method to be adopted both with small plants and large ones. There will be no danger of such trees as the Beech and Maple bleeding next spring, if dug up and the pruning done this fall; besides, most farmers have more time to spare for such work at this season than in the hurrying days of spring.

Dry Goods, &c.

LORD & TAYLOR

SILKS.

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lake of Life.*

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

New Publications.

THE YOUTH'S COMPANION
A WEEKLY PAPER FOR
YOUNG PEOPLE AND THE FAMILY

THE COMPANION aims to be a favorite in every family—looked for eagerly by the young folks, and read with interest by the older. Its purpose is to interest while it amuses; to be judicious, practical, sensible, and to have really permanent worth, while it attracts for the hour.

It is handsomely illustrated, and has for contributors some of the most attractive writers in the country. Among these are:

J. T. Trowbridge,	Louisa M. Alcott,
Edward Eggleston,	J. G. Whittier,
James T. Field,	Louise C. Moulton,
Rebecca H. Davis,	C. A. Stephens,
Mrs. A. H. Leonowens,	Harriet P. Spofford,
Edward Everett Hale,	Julia Ward Howe.

Its reading is adapted to the old and young; is very comprehensive in its character. It gives

Stories of Adventure,	Stories of Home and
Letters of Travel,	School Life,
Editorials upon Current Topics,	Tales, Poetry,
Historical Articles,	Selections for Declamation,
Biograph'l Sketches,	Anecdotes, Puzzles,
Religious Articles,	Facts and Incidents.

Subscription Price, $1.75. Specimen copies sent free. Please mention in what paper you read this advertisement.

ARTHUR'S

Illustrated Home Magazine.

Year after year the Home Magazine continues to gain in favor with the people. Taking rank with the best periodicals of the day, it claims **1877** to be, in its peculiar character and varied departments, more thoroughly identified with the people in their common life and social interests, than any other magazine of its class.

Terms, $3.50 a year; 3 copies $6.00. For $12.00, six copies and one extra to club getter. *Specimen number 10 cents.*

GREAT PREMIUMS For 20 subscribers at club rates, we give as a Premium, a copy of our Great National Picture of all the Presidents of the United States, elegantly framed in heavy Walnut and Gilt Moulding. The most valuable premium ever offered for subscribers at club rates.

Home Magazine for sale by News Dealers.
T. S. ARTHUR & SON, Philadelphia

The American Naturalist;

A POPULAR ILLUSTRATED MONTHLY MAGAZINE OF NATURAL HISTORY AND TRAVEL.

ANNOUNCEMENT FOR 1877.

This journal of popular Natural Science will continue to be published by Messrs. H. O. HOUGHTON & Co., Riverside Press, Cambridge, Mass., under the editorial management of Dr. A. S. PACKARD, Jr., with the assistance of eminent men of science.

The typographical dress and illustrations which have heretofore given character to this magazine, have been improved, and it is of a thoroughly popular nature, so as to interest the general reader as well as the young naturalist. It will continue to be a journal of science-education and for the use of science-teachers.

In 1876 the latter half of the magazine was entirely remodeled, and a department of **GEOGRAPHY AND TRAVEL** added. The Department of **BOTANY** will be edited as formerly by Prof. G. L. Goodale of Harvard University. That of **MICROSCOPY** will be edited as heretofore by Dr. R. H. Ward, Troy, New York. Arrangements have been made to report the **PROCEEDINGS OF SCIENTIFIC SOCIETIES** with great promptness. A digest of the **CONTENTS OF FOREIGN SCIENTIFIC JOURNALS AND TRANSACTIONS** will also be given each month, together with the **LATEST HOME AND FOREIGN SCIENTIFIC NEWS.**

Professors Gray, Whitney, Shaler, Farlow and Goodale of Harvard; Marsh and Verrill of Yale; Mr. A. Agassiz, and other leading naturalists, are among the contributors. Notes from abroad will occasionally be contributed by Mr. Alfred W. Bennett, the distinguished English botanist.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

The only line running Hote Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

Wit and Humor.

HOW HE ROUNDED THE LAKE.

He was a tramp, bound Chicagoward, and as he boarded the couplers at the rear of an incoming engine, just across the line in Indiana, one recent dark and chilly night, he had faith to believe that he had a "soft thing" of it for a cheap ride. But the conductor, with his eagle eye and railway lantern, soon espied the moneyless passenger on his uncushioned and comfortless seat. Did he order him off. No. He had a deeper plot. He let him remain, while on and on went the train, from station to station, until it reached a great tank, where the engines stop to "water up."

"Now for him," grinned the heartless conductor, as he passed to the front.

"Now for him," he maliciously continued, as he grasped the water-trough from the fireman's hand's and directed it over the back end of the engine.

"Now for him," he fiendishly grunted, as he heard a Noah's deluge pouring over the head and down the back of the luckless tramp.

All grew still and the conductor ordered his train on its way, convinced that he had drowned the tramp, or at least flooded him so far away that he could never get back again.

But when that conductor drove into the depot in the early morning, there was a surprise in store for him.

"Be you the conductor?" inquired a shivering voice at his elbow, as he stepped on the platform.

"Yes," said he, looking around and gazing upon a bedraggled and cinder-covered man. "Then I want ter ask yer why yer don't run around the end of the lake in comin' inter town?"

"I do," said the conductor.

"Yer do?" exclaimed the man.

"Certainly," was the reply.

"Wal, I gosh!" muttered the stranger in a bewildered tone, "blest if I didn't think yer swum through the lake!"

Then the conductor knew that his tramp still lived and was water-proof.—*Chicago Journal.*

SPARKS AND SPLINTERS.

"Can there be anything brought into this house," asked a disgusted member during the last session of the Legislature, "that will not be repealed sooner or later?" One of the Opposition suggested "a skinned orange."

"Mamma, if we cross the bridge at night must we pay toll?" "Of course, my dear; why do you ask?" "Why, because the river has gone to home to sleep." "Oh, the river never sleeps." "Then why has it a bed, mamma?"

Some one was praising the British public schools to Charles Landseer, and said: "All our best men were public school men. Look at our poets. There's Byron, he was a Harrow boy—" "Yes," interrupted Charles, "and there's Burns—he was a plowboy.

A Proper Example Thrown Away.—Industrious (?) Seafaring Party—"What! Ain't got nothin' to do? Why, here I've been a-mendin' this blessed net ever since last November, and you're a-idlin' about as if there warn't such a thing as work in the world!"

Labor et Ingenium."—Lady—"Are those the hardest boot brushes you have?"

Shopkeeper—"Oh yes, m'; fact is, m', they're generally considered too hard for boots, m', and are used by laundresses to scrub gents' shirts and collars in'. They're the hardest brushes made, m'?"

A definition.—"What would be your notion of absent-mindedness?" asked Rufus Choate of a witness whom he was cross-examining. "Well," said the witness, with a strong Yankee accent, "I should say that a man who thought he'd left his watch to hum, and took it out'n 'is pocket to see if he'd time to go hum and get it was a leetle absent minded."

Deceived.—It was at the second battle of Bull Run that a cannon ball carried off a poor soldier's leg.

"Carry me to the rear!" he cried to a tall companion, who had been fighting by his side—"My leg is shot off."

The comrade caught the wounded soldier up, and as he was about to put him across his shoulders, another cannon ball carried away the poor fellow's head. His friend, however, in the confusion did not notice this, but proceeded with his burden toward the rear.

"What are you carrying that thing for?" cried an officer.

"Thing?" returned he. "Its a man with his leg shot off."

"Why, he hasn't any head!" cried the officer.

The soldier looked at his load, and for the first time saw that what the officer said was true. Throwing down the body he thundered out: "Confound him! he told me it was his leg!"

RURAL RATES REDUCED!

In announcing the reduction of the subscription price for The Rural New-Yorker, we can only say that it is done in a spirit of justice to all our subscribers, who are now paying reduced prices for everything. The old price for The Rural has been $2.65 per annum, and the

Present Reduced Rate is $2.50 per Annum,

and in clubs of ten or more, $2.

Great encouragement has been given us in our efforts to make the

BEST ILLUSTRATED

Agricultural and Family Weekly

ever published, and we make, in this Centenary Year, this substantial acknowledgment of it. It now costs us less to make the paper, and we propose to give our subscribers the benefit of every cent of the reduced cost.

ALL WE ASK

is that each subscriber and agent will continue his efforts to increase our list so that we can make a still further reduction.

The cheapest paper is not always the best, but

The Best Paper is Always the Cheapest!

Subscribers, show The Rural to your neighbors and ask them to subscribe. They will be benefited and you will be profited.

ALL AGENTS ATTENTION!!!

Increase your lists at the reduced rates and get larger Premiums.

The Naturalist.

AMERICAN ELK OR MOOSE.
(Alce Americanus.)

This magnificent animal, which was formerly very abundant in the more northern of the Eastern States, is rapidly disappearing before the constant onslaughts of our hunters. In some parts of the West, especially in the more mountainous regions of the Northwestern Territories, the Elk is found in considerable numbers; but such noble game is not likely to long remain unmolested in any locality where the intrepid hunter can possibly penetrate with any degree of safety. Hence we frequently hear of a terrific slaughter of these animals by men who have no other object in killing them than to acquire the name of being good sportsmen.

Elks live in the woods in the northern parts of both continents, but the American Elk is considered by many naturalists as a distinct species from the European. The true American Elk, or Moose, as it is called in some localities, is the largest and strongest of all other members of the Deer family, possessing great speed and remarkable endurance. A full-grown male stands about five feet high at the shoulder, measures seven feet from the nose to the tail, and weighs from 800 to 1,200 pounds.

The Elk is rather awkward and clumsy in appearance, but when seen in his native haunts he displays a certain majesty which commands admiration.

The horns are found upon the males only and require five years for their full development. They begin to grow or sprout in early spring, and complete their annual increase about midsummer. The first year they are about one inch in length; the second year, four to five; then they commence to divide, forming round forks or prongs; the fourth and fifth years they become palmated in form, as shown in our illustration. Sometimes these palmated antlers are a foot wide, terminating with several blunt points. The horns are said to diminish in size after the animal has passed the period of its greatest vigor. In mature and vigorous animals the horns are shed in December, but the young males often retain them until March.

The Moose, as they are usually called in the more Northern States, are still to be found in Maine, Canada, Nova Scotia and Labrador.

The color of the hair of these animals is somewhat different in different individuals, so much so, indeed, that some of the darker colored have received the name of the "American Black Elk;" but the color in this animal is probably no more variable than that of other species of the Deer family. The general color above is blackish or ashy gray, and yellowish white below.

The principal food of the Elk in winter is the twigs of trees, and they are especially fond of those of the maple and birch; but in summer they feed upon the grasses, in addition to what they may obtain from trees and shrubs.

The flesh of the Elk is not as fine-grained or rich as that of the common Deer, still the stalks are juicy and often tender, but seldom fat like those of a bullock.

Elk have been frequently domesticated, but they possess no merits which would make them more desirable than the farm animals generally in use.

THE TARANTULA.

The Tarantula is a species of Spider, and is said to have received its name from the City of Tarentum, in Italy, near which it is found in great abundance. But there are many species of these large Spiders, some of which inhabit our Southern States, California and Mexico. We have frequently received specimens from our correspondent in Texas, some of great size, their legs spreading fully five inches, which gives them a very formidable appearance. The American and European species of the Tarantula are not only quite similar in appearance, but their habits also are nearly the same. Valetta, an Italian monk, who had many opportunities of observing these Spiders, published a very accurate history of them in 1706. The bite of these Spiders is reputed to be exceedingly poisonous, but the accounts of death from this cause are probably greatly exaggerated through fear and frequent repetitions of the same story. The peasants of Italy have a method of getting the Tarantula out of his hole in order to destroy him. Their plan is to make a soft, hissing noise through a straw. The creature is attracted by the sound, and probably thinking some luckless insect is within his reach, hastens to seize it, when he meets his human foe.

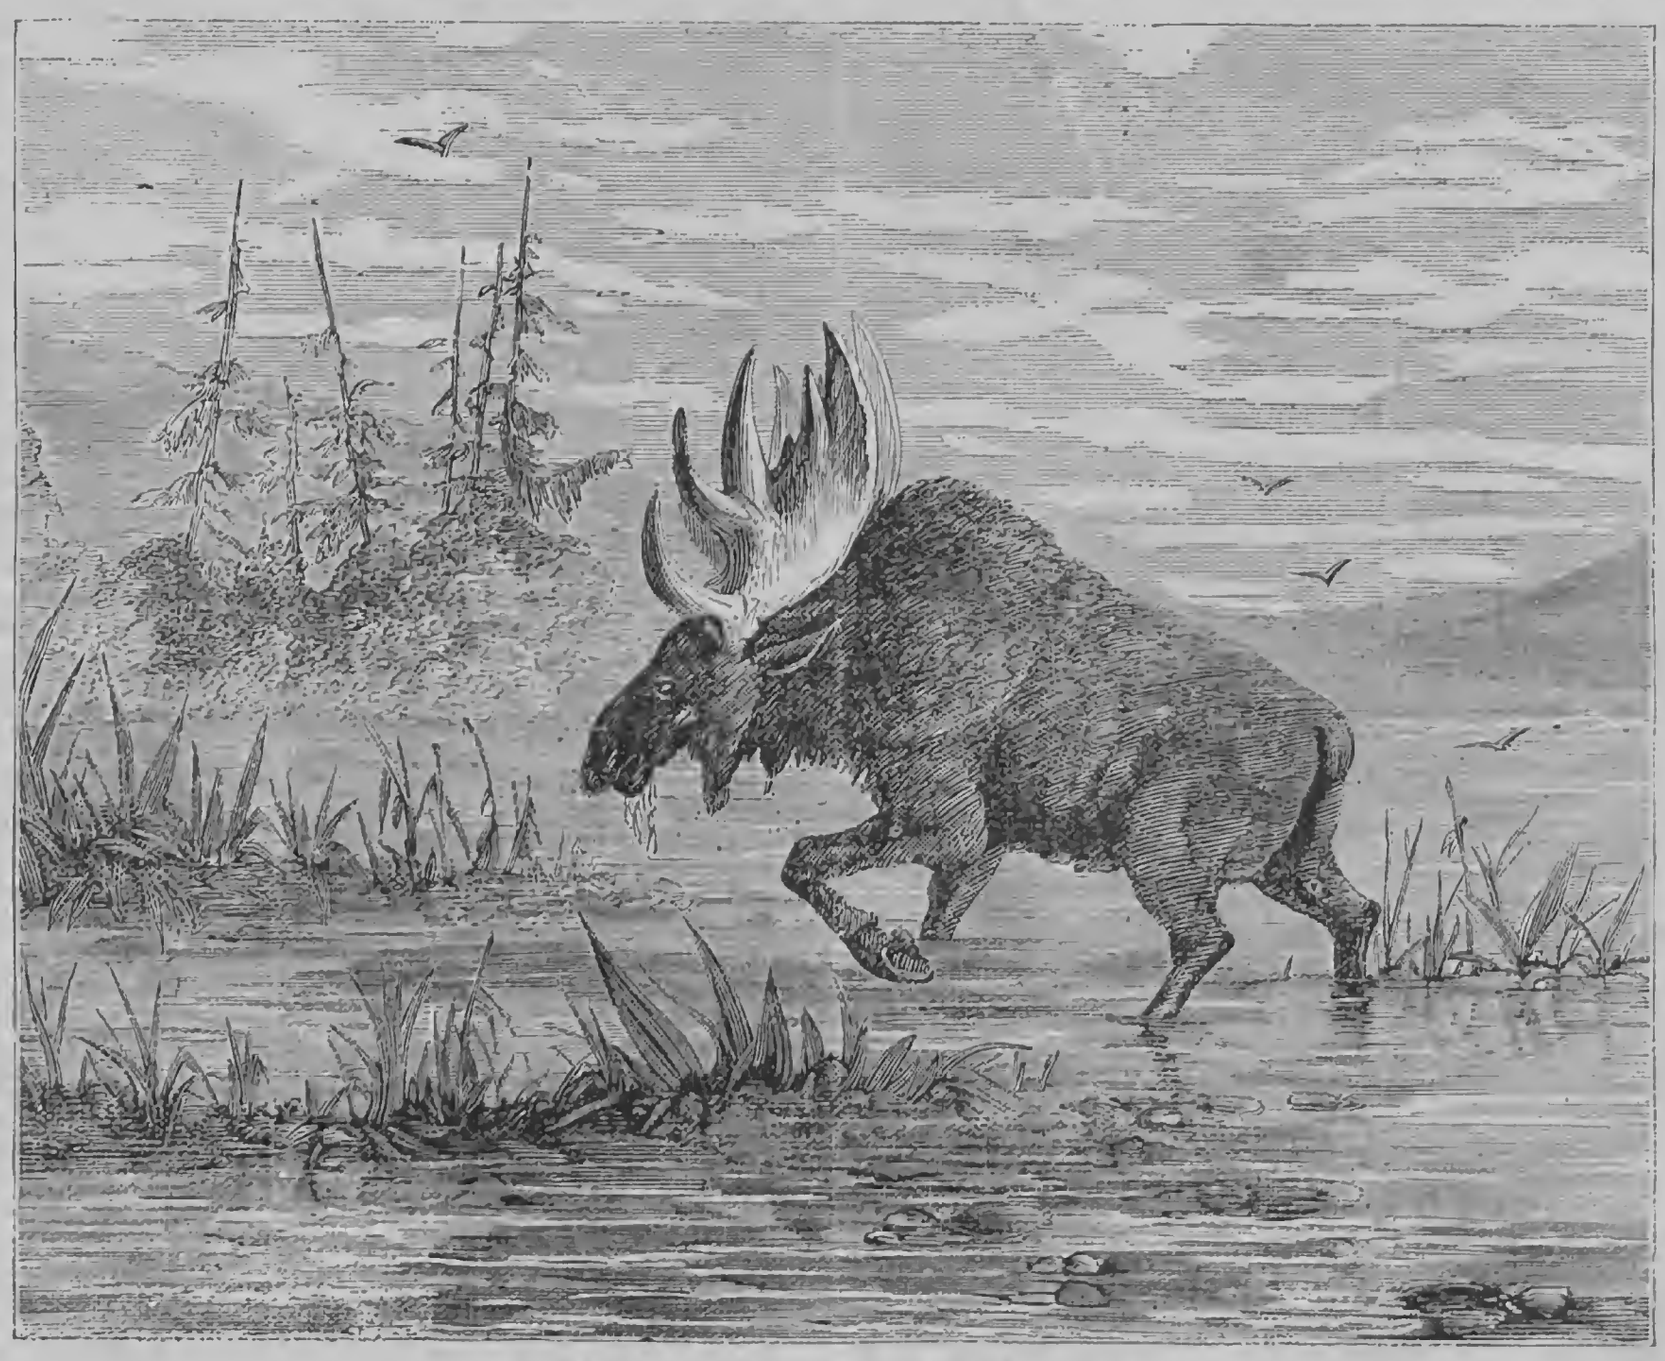
Wonderful stories are often related of the ferociousness of the Tarantulas of Texas, the *Mygale Hentzi* of naturalists, but so far as these stories assert that the Tarantula is disposed to attack human beings, we set them down as mere fancy or the effect of an excited imagination, although we have no doubt but that they would bite if roughly handled. But the Tarantulas have a very formidable and deadly foe in a large and powerful Wasp known as the *Pepsis formosa* of Say. This Tarantula-killer is one of the many species of Digger-wasps which bury their victims in holes in the earth as food for their own young or larvæ. The Spiders are stored up by these Wasps in a paralyzed state, but not actually killed, and so soon as the Wasp eggs hatch, the grubs commence feeding upon the imprisoned Tarantulas. Some of our Northern species of Mud-wasps use the smaller species of Spider for the same purpose, and the increase of Spiders is kept in check by the much-hated Wasps. Many a boy who reads the Rural has probably been puzzled to know how the Spider came in the Wasp nests which he has found attached to the rafters of the barn or other outbuilding, and what they are put there for, but by carefully looking among the Spiders, a Wasp egg or the grub hatched therefrom can usually be found, and this will explain the mystery.

HOUSE SPIDERS.

I have often observed, says a writer in the Gardener's Chronicle, the power in Gossamer Spiders of ejecting forcibly from the spinners a web which they use as a means of moving from one place to another. I was not aware until lately, however, that the same power was possessed by the common house Spider.

I caught one of these the other day for the purpose of finding out if it was capable of ejecting its web by muscular effort, and I propose giving the result at length. Having placed my Spider upon a pencil held between my finger and thumb, I watched him carefully, noting all his movements. The sage insect proceeded deliberately to take a tour round his somewhat limited quarters, and, finding at length that he could not escape by either end, he carefully attached a web to the pencil and descended rapidly.

I wound the web up on the pencil, so as to prevent him reaching the ground, and after trying the same plan a good many times, he stopped in the middle of the pencil, and apparently "took a big think," the result of his meditation being another descent of about a foot from his support. He then gathered himself up into a little ball, elevating his abdomen, and, much to my astonishment, ejected the web unconnected as it proceeds from the spinner to the distance of about a foot, when the whole converged into a focus, as it were, forming a complete web, which continued sailing outward until it attached itself to my coat; the Spider, after giving the web a few tugs, then passed over, and so escaped. Thinking I might be deceived as to the web coming out in so many parts, I caught several more, and repeated the experiment about a dozen times, so that there can be no doubt as to the fact. I shall be glad to hear that some one else has tried this, so as to confirm it.



AMERICAN ELK OR MOOSE.

PANGOLIN.

This curious animal, commonly known as the Scaly Ant-eater, is a native of the old world. It has a long, pointed snout, but has no teeth, but has a prehensile tongue, with which it catches its victims. The Ant-eaters are found in various parts of Asia and Africa, living in holes which they dig in the ground. The largest species is the Short-tailed Pangolin (*Manis pentadactyla*, Linn), and is 3 to 4 feet in length, with five toes. Hence the specific name. The scales are deep brown in the adult animal and hard enough to turn a musket-ball. Another species, the Long-tailed Pangolin, *M. tetradactyla*, found in Guinea, has but four toes and a much flatter tail, which is nearly twice as long as its body. From their external covering and shape, they resemble the Scaly Lizzards more than they do the true mammals.

The Poultry Yard.

PREPARE FOR WINTER.

The cold season is close at hand in the Northern States, and those who wish to have their fowls pass the long winter in health and comfort should look to the hen houses without delay. Examine the roof and make sure that it is sound and strong. *Now* is the time to make repairs, not later in the season, when a night's exposure may bring serious sickness into the flock. If the hen house is a shed annexed to an outbuilding, examine it at the peak where it joins the main building, and make sure that it is well in place. You will find it pay to lay good felting on the roof and to give the whole roof a coating of cheap paint. Last year I felted the roof of my fowl house, but was bothered during the winter by the heavy winds, which succeeded in getting under the felting and tearing or peeling it off. I tried lathing it down, but this was unsatisfactory for two reasons: If I nailed the laths continuously, the water would not run off quickly enough, and to cut the laths into short pieces was troublesome to do and consumed much time.

This season, in re-felting my houses, I have adopted an eminently satisfactory method: I have had the tinsmith cut strips of tin about an inch wide and as long as I could get them, and after laying down the felting lapped one inch over, *I nailed this strip of tin along the edge*. The tin is so thin that water runs off the roof without any obstruction, and it is impossible for the wind to get under the paper. The tin, fastened down with galvanized nails, gives a neat finish to the roof, and is both economical and effective.

Examine the interior of the houses and see that they are tight. If you expect a goodly stock of eggs from your fowls, you must keep their house warm, and there is no better way of doing this than by lining the house with strong paper. It is the cheapest lining, and if saturated with a moderately strong solution of carbolic acid, will keep vermin at bay. Don't say that this is "too much trouble." So it is a trouble to bed the cattle and feed the stock, but you must *expect* to take some trouble if you demand a profit from them. Don't begrudge trouble in the fowl house. The result will be seen in the filling of the egg basket, and there is no portion of the farm that will pay a higher percentage of profit on the outlay of labor than the hen yards.

Clean out the nests, wash them with either kerosene or carbolic acid, and put a fresh turf in the bottoms. *A dirty box will make a willing layer steal her nest.* Bear that in mind as a golden rule and you won't have to spend so many hours in the woods searching after runaway hens.

The nights are becoming longer and colder. See that the fowls have, before dusk, a few handfuls of whole-corn and a comfortable roost. If your fowls are to be kept in health, they must not be left all night with empty crops, nor allowed to roost in exposed places. The plan of allowing a fowl the exquisite privilege of roosting on "a rickety beam and an empty crop" is anything but economical. Don't have the roosts one above the other, or the birds will be continually fighting for highest place.

Before you go to bed, take a look at the chickens. There is no better time to inspect them than when they are quiet on the perch. I make it a rule to go through my fowl house *every night*. I have been singularly fortunate in the health of my flock, and I ascribe it to this practice. Passing along the roost, which is low, you glance at each bird, and being accustomed to their faces, it is wonderful how soon you will learn to detect the *first* symptoms of illness. The altered appearance of the bird from the evening before strikes you almost instantly, and the trouble being taken *at the start*, you can at once remove the bird and stop the disease from spreading through the flock.

If you have an old window-sash about the place, for which you have no special use, put an extra light in the southern or eastern end of the fowl house. It will be grateful to the fowls in winter, on cold days, when they will huddle together in the house to escape the biting winds. The sash will enable them to bask in the sunlight without going out of the house, and the increased good health of the chickens will repay your trouble.

Those who intend to house birds for the winter should let them run as much as possible now, while the grass is green. Don't shut them up until the last moment, and they will so much the better bear the winter's confinement.

When preparing birds for exhibition in winter, I generally pen them two weeks before the date on which they will be needed; but so far this season I have let them run until an hour or two before being sent away, as I cannot bear to deprive them of the yet green grass.

It is not yet too late to lay in a stock of dry dust from the road. Collect it with a road scraper and store it away in one corner of the barn, where it will remain dry, for winter use. It will be invaluable for the fowls to dust in while the ground is frozen, and will tend to keep them free from vermin.

If in winter you pen your fowls in flocks, let me suggest a plan that will prevent the spreading of disease from pen to pen: *Mark all the tins in one coop* with the same number, and always use "No. 1" tins in "No. 1" pen. Then you will not carry any contagious disease from one to the other. I have adopted this plan, and have found it an admirable one.

Lastly, *feed* your fowls liberally, and they will *return it* to you with interest. Keep them *cleanly* and *disease* will be a rarity. *House them* comfortably and they will *lay* regularly.

"Regular meals" is the secret of the successful fancier. Remember the old darkey who, when his master scolded him for having so poor a dinner for the guests, pointed to the empty larder, saying, "Well, Massa John, ole Pomp do do best he can; but in dese yere times miracles dey am scarce, an' ole Pomp he can't make som'thin' out ob nothin'!"

Don't expect the hens to make "som'thin' out ob nothin'," for they won't—and they *can't!*

THOMAS W. WHITE.

WHAT AILED THE DUCKS.

On reading the article headed "What Ailed the Ducks?" in the RURAL of Oct. 28, we inferred, from the description given by the writer, that it was the disease known as Vertigo that attacked his young ducks and silenced forever their gentle quacks.

Probably the most common symptom of the disease is a loss of power over the muscular system, to such a degree that the bird is wholly or partially unable to "navigate." All this is doubtless caused by a rush of blood to the head, producing extreme dizziness.

The following is from "The People's Practical Poultry Book," and the remedies given for this disease are probably as good as any:

"The affection is one caused by undue determination of blood to the head and is dependent on a full-blooded state of the system. Holding the head of the fowl under a stream of cold water for a short time immediately arrests the disease, and a dose of any aperient, such as calomel, jalap, or castor-oil, removes the tendency to the complaint."

We may not be right in saying that it was Vertigo that "ailed the ducks," but certainly the symptoms mentioned by the writer, such as whirling round, tipping over backward, rolling over and over, and all such performances, point to this disease. H. A. B.

Fond du Lac, Wis.

MATING EXTRAORDINARY.

A CORRESPONDENT of the Poultry Review tells the following rather strange story of the mating of birds:

Seeing in many numbers of your invaluable paper, invitations to fanciers to send you accounts of extraordinary matching or mating among birds, I take the liberty of sending the following as likely to interest brother fanciers. I have now in my loft an African owl cock that I mated with a hen of the same kind; they lived harmoniously together, and raised last season five pairs of young. During the winter I had the misfortune to lose the hen, when the cock, being a lively little fellow, set about finding another wife for himself. After a few days he succeeding in finding a wife in an unmated agate hen, who in due course of time laid the usual couple of eggs, he (the owl) assisting her regularly in incubating them; but when flying about the loft I noticed he was paying marked attention to a blue Antwerp hen, who, in a fortnight after the agate laid, also laid him a couple of eggs, the owl, in the most exemplary manner, assisting both his wives; the result being that the agate's eggs are hatched, and the young ones are progressing favorably, the owl regularly feeding them, and also assisting the Antwerp in incubating her eggs, which are due in about four days.

TO KEEP FOXES FROM FOWLS.

THE London Globe is responsible for the following, and we can only say that it is worth trying where foxes abound:

"A good plan to keep foxes away from tame pheasants, if you have them in coops, is to have the shrubs and trees well tarred, for foxes dislike the smell of tar and won't come near it. A barrel of tar will save you much trouble. Get a large brush and dab the tar all about the place, and they won't come near your tame birds. Another good plan is to have a string tied from tree to tree and bush to bush, a foot or so from the ground, and another piece a foot or two higher. Foxes hate anything like that to impede their way, and will generally turn from it, thinking it is some sort of trap or snare for them. But nothing beats the tar. It is very inexpensive, too, and will often save your birds."

A REMARKABLE HEN.—Col. S. I. BERDAN of Paramas, N. J., owns a hen that this summer hatched a brood of thirteen turkeys. How the hen managed to cover so many large eggs and hatch them all is a mystery that Col. BERDAN had better reveal at the next meeting of the Bergen County Poultry Association.

Dairy Husbandry.

ANNUAL MEETING OF THE VERMONT DAIRYMEN'S ASSOCIATION.

THE annual meeting of the Vermont State Dairymen's Association was held at the State House, in Montpelier, Oct. 25th, Hon. E. D. MASON, President, in the chair. The meeting was well attended in the afternoon, and Mr. O. S. BLISS, the Secretary, submitted his annual report, after which there was discussion upon various topics pertaining to the business operations of the Association.

OFFICERS FOR THE ENSUING YEAR.

The following board of officers was elected for the ensuing year: President, Hon. E. D. MASON of Richmond; Vice-Presidents, N. T. SPRAGUE of Brandon, E. S. WOOD of Pomfret and C. S. MCALLISTER of Enosburgh; Secretary and Treasurer, O. S. BLISS of Georgia. A Board of Trustees from each county in the State was subsequently elected.

The President stated that the annual address by Mr. X. A. WILLARD of New York, would be given in the Assembly Chamber, commencing at 7½ o'clock, P. M., the Legislature not holding an evening session, and a general invitation to be present was extended to members of the Legislature, and all others interested in Vermont dairying.

CENTENNIAL DAIRY MATTERS.

Mr. STODARD called upon the Secretary for a report in regard to the dairy display at the Centennial. It was understood that the project had been a complete failure. Funds had been subscribed from Vermont. The members of the Association would be glad to have more light on the subject, etc., etc.

Mr. BLISS said he was ready to make a full report of his connection with the Centennial Dairy Committee of the American Dairymen's Association. The great dairy interest of the country had been prostituted by a scheming "Dairy Ring." Mr. BLISS was proceeding to give a history of the "Dairy Ring" and its operations, when members present suggested that the report had better be delayed until after the lecture in the evening, as it was now near the time for adjournment of the afternoon session. On motion, Mr. BLISS was requested to make his report in the Assembly Chamber immediately after the lecture. The meeting then adjourned until 7½ o'clock in the evening.

EVENING SESSION.

There was a large audience gathered at the Assembly Chamber of the State House, nearly filling all available space. Promptly at 7½ o'clock the President introduced Mr. X. A. WILLARD of the RURAL NEW-YORKER, who proceeded to give the annual address, his subject being "American Dairying." The following abstract of the address is given by the Montpelier Daily Journal. It says:

"The address of the Hon. X. A. Willard, of Little Falls, New York, followed. It elicited strict attention throughout, and we regret to condense the address into so brief an abstract as we are compelled to do in the following:

MR. WILLARD'S REMARKS.

"The manufacture of cheese and butter was known and practiced more than three thousand years ago. In the earliest history of the human race mention is made of cheese and butter, and there is reason to believe that these products were known and used as food many ages before the earliest record of them by the writers of antiquity. He then alluded to the first notice of the manufacture of cheese in the Book of Job; the message of David to Elah, concerning the 'ten cheeses;' to the reference to the dairy made by Homer; the testimony of Julius Cæsar, concerning the milk and cheese of ancient Gaul—and drew the conclusion from these and other allusions in the Bible that the products of the dairy have a history at least forty centuries old. It is remarkable that during all these ages dairy products have been regarded as luxuries. Abraham set before his angel visitors 'milk and butter, and they did eat.' The latter was not, possibly, 'gilt-edged,' but if good enough to be set before angels, must have been superior to much butter made at this day.

"Mr. Willard said he had been invited to address the Association upon 'American Dairying,' which, as a specialty, was less than a century old. In Europe, dairying has a history dating back to the sixteenth century, but previous to 1800, very little more than crude methods of butter and cheese-making were practiced in the United States. Most farmers, in those days, kept a stock of horned cattle—animals raised for beef, for working oxen, with cows for breeding, and for producing milk, butter and cheese to supply home wants.

THE FIRST BIG CHEESE OF WHICH WE HAVE ANY RECORD.

"Under the head of "The oldest dairy districts in America," Mr. Willard gave a short history of Elder John Leland's "great cheese," for the inception of which we are indebted to the exciting political times of 1800, Mr. Adams and Mr. Jefferson being the candidates. Elder Leland was a great power in the little town of Cheshire, situated among the middle hills of Massachusetts, and he preached such stirring Jeffersonian democracy to the people of Cheshire, that for generations they never voted anything but a "straight democratic ticket." Under these circumstances, it was no wonder that the "big cheese" was a success, when the conditions are considered. 'Every man and woman who owned a cow was to bring to a certain cider-mill, on a given day, every quart of milk produced, or all the curd it would make." No federal cow was allowed to contribute. The speaker's account of the gathering of the people and the manufacture of the cheese, also of Parson Leland's journey with it to Washington and its presentation to President Jefferson, was very interesting. The cheese weighed one thousand six hundred pounds.

COMMENCEMENT OF DAIRYING AS A SPECIALITY IN AMERICA.

"Mr. Willard stated that a few years previous to this memorable event, a New England farmer, a young man with eight silver shillings in his pocket, an ax on his shoulder, and two stout arms to swing it, as his stock in trade, crossed the Hudson and settled in the Mohawk Valley, the "Gateway of the Continent." He was the first that began dairying in Herkimer. He then gave an account of the rise and progress of the dairy interest, the mighty giant that is now stalking over the continent, dotting the land with countless herds. In 1812 the dairies of William Ferris, Samuel Carpenter, Nathan Salisbury and Isaac Smith numbered about forty cows each, and were regarded as extraordinarily large. In 1826 the business began to spread into counties adjoining Herkimer. The implements at this time were crude, consisting simply of tubs, wooden curd-knives, and log-presses. In the fall the cheese was packed and sent to market in rough casks. The principal buyers previous to 1826 were—William Ferris and Robert Nesbitt of Massachusetts. Their style of doing business was that of impressing inferiority and buying cheap. In 1826 Henry Burrill of Herkimer, engaged in the business of cheese-buying and became the chief dealer in Central New York. This gentleman was the first to open the cheese trade with England and made the first venture about 1830 or 1832, at the suggestion of the late Erastus Corning of Albany. His first shipment to Philadelphia was in 1828. Mr. Burrill is still in the trade, although nearly eighty years of age, and has shipped cheese abroad every year during the past fifty years—his shipments this year (1876) being about one thousand boxes per week. He has amassed a colossal fortune. Formerly Canada was a large purchaser of United States dairy products, but now it produces from thirty million to forty million pounds annually.

PROGRESS OF THE EXPORT TRADE.

"Under head of "Progress of the export trade," Mr. Willard says: In 1848 the export trade in cheese was fifteen million pounds; and the whole production in the United States that year was one hundred million pounds. The price was six to six and three-fourths cents per pound.

In 1862 the butter product of the country was about five hundred million pounds, of which we exported thirty million pounds. To-day our annual product is about one billion pounds and we export scarcely anything.

The cheese exports from the United States are now about 100,000,000 pounds per annum, and the yearly product upward of 250,000,000 pounds.

DAIRY ASSOCIATIONS AND DAIRY SCIENCE.

"The speaker alluded to the cheese factories and creameries of the country, and gave an interesting account of their establishment and progress. The Dairymen's Associations of the several States received recognition; also allusion was made to those of other countries, the speaker claiming that the idea and movement were purely American, yet he admitted that we have no scientists who can compare with Dr. Voelecker of London in regard to dairy investigations. To Professor Caldwell of Cornell University, is due the credit of having first expounded the "germ theory" to American farmers.

Our best cheese is now made in all its essential principles the same as that originated in Somer-

setshire, and which has been in vogue for more than a century at the foot of the Mendip Hills. He referred to the various theories and said:—The lesson which we, as dairymen, are learning, is a difference between speculative theories and sound practice. We have originated improved appliances for making, and methods of curing and pressing cheese—the cooling and aeration of milk, for its better flavor and condition, is also ours. Mr. Foster of Oneida, N. Y., was the first to discover that the odor of decaying vegetable or animal matter, when breathed by the cow in the pasture, would convey a taint to the milk in the bag. The speaker paid a high compliment to Jesse Williams as the originator of the factory system.

The late Gail Borden of White Plains, N. Y., was the first to successfully condense milk. Mr. Slaughter of Orange County, N. Y., was the first to adopt the associated system in butter-making, the Swedes and Danes the first nations abroad to adopt the American idea of butter factories. In closing the claims of American investigators, the speaker would mention Dr. Sturtevant of Massachusetts, and Dr. H. A. Mott of New York City who have recently made some interesting investigations in regard to milk.

In conclusion, Mr. Willard said:—Commissioner Wells, in 1869, estimated the value of the dairy products of the United States at four hundred million dollars per annum. The annual product to-day is not far from six hundred million dollars. He thought the New York butter and cheese exchange's estimate of the butter crop at one billion four hundred million pounds, at thirty cents per pound—four hundred and twenty million dollars—too high, but that it could not be far from one billion pounds per annum. The address closed with a sketch of the markets and market system of the country, of which we regret our space does not permit the publication in full."

"After the address Mr. Bliss explained his connection with the Centennial Dairy Exhibition at Philadelphia, which he denounced, in no measured terms, as an infamous swindle, in place of, what it should be, a creditable exhibition. He laid the blame at the doors of incompetent and corrupt officials of the exhibit, and endeavored to make plain the causes of the failure it has proved."

We shall refer to the report of Mr. Bliss on the Centennial "Dairy Ring" in another article.

There was much interest manifested at the meeting, and among those present at the evening session were Governor Fairbanks, with members of both houses of the Legislature, and other leading men of the State.

THE CENTENNIAL DAIRY EXHIBIT
BEFORE THE VERMONT STATE DAIRYMEN'S ASSOCIATION.

The report of Mr. O. S. Bliss, Secretary of the Vermont Dairymen's Association, in regard to the Centennial Dairy display being now in order, Mr. Bliss gave a brief history of the matter showing how the proposed dairy show at the Centennial had failed. A half dozen members of the Centennial Committee, appointed by the American Dairymen's Association (immediately after the Rome meeting of the Association in January last) took complete control of the movement, prostituting it to their own interest, and ignoring the other members of the committee of which the whole number appointed was upward of 50.

As early as 1873 a resolution was offered by J. V. H. Scoville before the American Dairymen's Association in regard to making a dairy display at the coming Centennial. A committee was appointed at that time of which he (Bliss) was a member, Scoville being named as Chairman. He (Bliss) had been a member of the committee from the first. At subsequent meetings of the American Association the committee was enlarged and, finally at the annual meeting in Rome, in January 1876, upward of 50 persons from New York and other States were enrolled as members of this committee. It was then and there resolved to make a vigorous effort to have a grand dairy display at the Centennial, and the sum of $10,000 was called for from Dairymen to pay the necessary expenses of such a display. Instead of accepting space, offered by the United States Centennial Commission, it was thought best to erect a "model Butter and Cheese factory" on the grounds, because the latter could be properly refrigerated, or the temperature so controlled as to keep exhibits of butter and cheese in good order during hot weather; and the $10,000 was believed to be amply sufficient for the erection of such a factory and *the employment of persons to take charge of exhibits* so that there should be no further expense to exhibitors. A considerable sum was subscribed by persons present at the Rome Convention, and a committee was appointed consisting of Messrs. Stewart, Reall, and Willard to draft a circular to be sent out to the Dairymen of the United States, advising them of the project and asking contributions. This circular was drawn up during the Convention and ordered to be printed by the committee of the whole.

Mr. Scoville was retained as chairman of the general committee, now numbering about 50 and Mr. O. S. Bliss appointed Secretary. In order that Dairymen and other subscribers to the fund might have *entire confidence that the money should be properly appropriated*, Gov. Horatio Seymour was appointed Treasurer of the fund. Up to this date all seemed to be harmonious and the different members of the committee, as well as dairymen generally, were enthusiastic in regard to the project and "a grand display," such as had never occurred in any country or age was anticipated.

But soon after the Rome Convention—said Mr. Bliss—the Chairman Scoville conceived the idea of running the committee and working up the whole matter in the interest of a clique. Meetings began to be held clandestinely by Scoville, Harris Lewis, L. B. Arnold, S. T. Hawley, T. D. Curtis and Josiah Shull, while the other members of the committee together with its Secretary, Mr. Bliss, were ignored or not notified in regard to such meetings. The circular which had been prepared and ordered to be printed by the "committee of the whole," was remodeled and changed by this clique to suit themselves and was then sent out. When this became known both, Mr. Bliss and Mr. Reall protested against this unwarranted procedure.

The winter meeting of the Vermont Dairymen's Association occurred several days after the Rome Convention. It was held at Rutland, January 19-22, 1876. To this meeting Messrs. Harris Lewis, L. B. Arnold, L. T. Hawley and T. D. Curtis had been invited and were in attendance, their expenses being paid by the Vermont Association. These members of the committee met Scoville at Utica by appointment on their way to the Vermont Convention, and they agreed upon a meeting with him on their return. While at the Vermont Convention the plan was arranged by these plotting members of the committee to absorb all the honors and emoluments growing out of the display. Bliss was not informed of any proposed meeting of the clique with Scoville until after the Convention had closed, and the New York delegation had taken its departure. Then, in conversation with a gentleman from St. Lawrence Co., N. Y., who had overheard the plans of the clique at the hotel, the intelligence came out concerning the game to capture the committee of the whole by an illicit meeting at Utica. Mr. Bliss was not only astounded but *grieved* that his guests should play him such a trick and at first discredited it. But the facts afterwards verified the information received. The clique on their way back stopped at Utica and met Scoville, and they then and there nominated L. B. Arnold and T. D. Curtis as Jurors, while Harris, Lewis, L. T. Hawley and Josiah Shull were appointed Auditors, thus virtually getting complete control of the funds, Gov. Seymour's name being put forward to induce subscriptions. Afterwards, when Mr. Bliss, as Secretary of the "committee of the whole," was ordered to enter upon his books a record of the doings of these six men at their illicit meetings he refused to do so, and hence the stormy session of the committee of the whole, at Philadelphia in February, an account of which has been given in the Rural.

Mr. Bliss referred to a long letter from L. B. Arnold—which he subsequently produced—dated February 1, 1876 in which Mr. Arnold attempts to explain why the circular was changed, and what he and the other members of the clique did with it on their return from Vermont, but no mention is made of the appointment of Auditors, or the nomination of Jurors at these illicit meetings, thus adding to the deceit. Mr. Bliss said he had been very desirous that the dairy exhibit should be a success. The committee had instructed him to visit the West in order to get subscriptions to the fund and induce an exhibit from that quarter. He referred to a letter from the Secretary of the Wisconsin Dairymen's Association which he produced, in which it is stated that the Wisconsin exhibit was due to the urgent solicitations of Mr. Bliss.

Referring to the Vermont contributions to the fund he said upward of $400, including the value of the scales donated by Col. Sprague were in the hands of Scoville and his ring-committee. He (Bliss) had presented a bill for traveling expenses for work done, which the auditing committee refused to audit. The Scoville committee had attempted to capture the balance of the Vermont subscriptions leaving him unpaid. The Ring of six had "kicked him" out of the Secretaryship and Shull had been writing letters as Secretary *pro. tem.* Since the first of June he had been silent and at no time had he thrown any obstacle in the way of the display. Early in the season his friends had urged his name as Superintendent, but Scoville and the Ring opposed such appointment. He had acted from the first honestly, earnestly and in good faith, hoping that the dairy display would be an honor to the country. The whole affair had been a miserable failure, a "laughing stock" to foreign nations and a disgrace to American dairymen. The responsibility must rest on the "Ring," and its management which had destroyed the confidence of dairymen and alienated the best friends of the dairy. He referred to his protests from time to time and his urgent request for *fair management*, his letters to Gov. Seymour, and in conclusion he called upon the President, Hon. E. D. Mason, who had recently returned from the Centennial to give his views of the matter, &c. Mr. Mason said he was at the Centennial during the recent meeting of the American Dairymen's Association. He attended a meeting of the "Ring Committee" at the Butter and Cheese building and said they were wrangling and quarreling. He considered the whole thing a failure and a disgrace.

In summing up this matter it appears that the money employed for the dairy display is not far from $13,000. The State appropriation from New York, $8,000; Canada, $2,000; New York City, $600. Subscribed by Dairymen of New York between one and two thousand. Vermont, $400; Pennsylvania, Ohio, and other States say $1,000, and the result has been a building labeled "Scale Works," and "Butter and Cheese Factory," where a cheap restaurant has been run all the season for the benefit of *Somebody*. The Dairymen of the United States have not responded to the call for an exhibit of dairy goods, and in order to get a display from New York, for the October exhibit, the Ring management had to employ an agent to purchase the cheese and send it forward to the "model factory."

We refrain from alluding to matters connected with the affair which must cause dairymen to blush. The Vermont dairymen evidently ought to congratulate themselves on being so fortunate as to have kept Vermont goods away from the Exhibit, and the "Centennial Dairy Ring" gets no sympathy in Vermont.

The Horseman.

SUCCESS IN BREEDING HORSES.

Mark Comstock contributes a paper to Wallace's Monthly, on the above subject from which we condense the following:

Many breeders have plans to start with, but either forget them at the critical moment, or change them so often that their selections point to no clearly defined method. This is nearly always the experience of the novice. He is educated only by experience, and gains his knowledge by the mistakes he finds he has made at the start.

Hence we find many places with a few choice animals, and a large number of ordinary ones, that it would be desirable to dispose of could a purchaser be found, but which are generally held because the owner dislikes to face the necessary sacrifice. The first loss is generally the best in such cases, and that fact is coming to be generally understood with the present depression in the selling value of even choice animals. Where lack of means dictates selections, it would not appear so strange that animals wanting in some of the essential qualities for breeding, should be chanced in the hope that the deficiency may be counterbalanced by other superior features, and overcome in a proper cross; but with ample means at command, many young breeders make their purchases at random, and completely squander their advantages. Sooner or later most of them better their condition by either selling out entirely, or weeding out their stock and repurchasing. The writer has noticed in an extended observation of some years past, that frequently the poorest beginners have afterwards become breeders of excellent judgment. Experience is an expensive but very effectual teacher, provided the recipient of the lesson is capable of learning. But there is now and then a clear business mind that takes up this subject of breeding and makes a study of it before venturing to put its deductions into practice. Such men determine what they want before they buy at all, and then keep their aims clearly in mind while selecting. They go straight by their chart from the first, and usually accomplish something to show for it. They do not all follow the same path, or do they all aim to accomplish precisely the same object; but, having thought far enough to create an ideal which they hope to imitate, it generally possesses sufficient merit to be of value when approximated, and hence they succeed as breeders.

It is frequently asserted that there is no definable way of breeding that will bring success and that the whole system is one of chance, great results coming when least expected and disappointment following the most logically-conceived plans. There is a greater measure of truth in this claim than even the most ardent enthusiast on the subject can set aside, if the object sought be profit in the investment, and no other aim in view in the breeding problem than the bare question of trotting speed, and bottom. The most successful breeders in this country produce too many blanks to their number of prizes to keep the balance sheet right, unless the blanks possess a value independently of the question of speed; and with the blanks in the ratio in which they appear on many stud farms, it is a question whether their disposal is not a matter of far greater moment in a financial sense than that of the prizes. It is the common experience of breeding on any considerable scale, that after a few years' trial it is found desirable to reduce the mares in numbers to the few for which a direct nick has been found, and dispose of the others, no matter with what care and judgment they were originally selected. This has been the experience at Thorndale, Stony Ford and other noted establishments, and must continue to be so. Therefore, every point which tends to produce a foal salable for other purposes than speed, that can be compassed without sacrificing the chances of that most valuable element, should receive due business consideration in selecting breeding animals, in order that the produce that fails to come up to the standard may yet bring the breeder out without loss.

THE HORSE PLAGUE IN EGYPT.

The English Veterinarian for October gives some accounts of the horse plague in Egypt from which we glean that a virulent form of anthracoid disease is reported to exist among horses in that country. The term "equine typhus" is applied to the affection, but there does not seem to be any reason for the suggestion that the disease is of the nature of typhus. The malady, it is presumed, was contracted during the Abyssinian expedition. Some of the Egyptian horses which accompanied the expedition were first attacked at Massowah, and many of them died, others recovered, and these or others which had been exposed to the affection introduced it into Egypt. About the month of July the epizootic was observed at Ismalia. In August it reached Cairo, and spread rapidly to the towns of the Delta. In Zagazig the losses among horses and mules have been considerable, and in the country around still more serious results of the progress of the malady are reported. The symptoms are indicative of cerebral disturbance in the first instance: the animals are dull and drowsy, the head is allowed to fall until the nose touches the ground, the respiration becomes quick and labored, and in the latter stages symptoms of abdominal pain are exhibited. Post-mortem examination reveals serious exudation under the cerebral membranes, an apoplectic state of the lungs, and engorgement of the whole of the mucous tissue. Effusion into the pleural and peritoneal sacs is also found. The liver and kidneys are soft, and the mesenteric vessels are charged with blood; there is also, in most cases, evidence of extensive parasitic invasion of the vascular and digestive system. It is asserted that, in order to prevent the introduction of the disease into Europe, no horses are allowed to be exported without a special license.

A NEW FOOD FOR HORSES.

A new kind of mash for horses is now coming into use. It is thus described by the California Farmer:

It is composed of two quarts of oats, one of bran and half a pint of flax seed. The oats are first placed in the stable bucket, over which is placed the linseed; add boiling water, then the bran, covering the mixture with an old rug and allowing it thus to rest for five hours; then stir the mass well up. The bran absorbs while retaining the vapor, and the linseed binds the oats and bran together; a greater quantity of flaxseed would make the preparation too oily and less relished. One feed per day is sufficient; it is easily digested, and is especially adapted to young animals, adding to their volume rather than to their light, giving substance to the frame. Prof. Sanson reminds us not to overlook food, in connection with the amelioration of stock. He considers oats, so generally given to sheep, as objectionable, and approaching the unprofitable; rams generally receive one pound of oats daily; ewes half the quantity. Oats forming an exciting food are especially suited to rams during the season they are to serve, but for hastening the development of young sheep, they only build up the bones, not the flesh.

Horses in Great Britain.—The number of horses in Great Britain fell from 1,461,061 in 1869 to 1,276,444 in 1873; but the number has since increased, though not yet equal to that of 1869; in 1875 the number was 1,340,129. In Ireland, horses rose from 527,248 in 1869 to 540,745 in 1872, but fell to 526,160 in 1875. The total of the United Kingdom for 1865 was 1,866,289.

Pomological.

THE CULTIVATION OF PLUMS.

A CORRESPONDENT of the Agricultural Gazette (Eng.) in writing of the cultivation of plums, gives his experience as regards the culture and value of certain varieties which we think is similar to that of many of the most extensive cultivators of this fruit in the United States:

The plum, like many others of our hardy fruits, is a tree that will make a great amount of growth, and become, in a measure, barren for the want of restriction. But it can also be made abundantly fruitful, even in a small and young state. Young trees bought from a nursery and planted against walls with an east or west aspect, and in a soil of a somewhat strong nature, will make a great amount of wood in the form of shoots, sometimes a yard long, as we have experienced; and even when grown as pyramids, and in the bush form, we have had them make shoots as long, and they have gone on for several years making an abundance of growth, but affording us no fruit.

In the autumn of 1874 we had several trees growing against the walls in our garden which had been planted five or six years previously, and they had been carefully trained and pruned, but never carried a single fruit. We made an attempt to root-prune them by simply digging a deep trench 2 feet six inches from the stem, which formed a half circle around the trees. We severed many large gross growing roots, and where we cut them off we were careful to make a clean cut with a sharp knife. After we had so treated them we filled in the trench, well treading the same, but we left one tree to ascertain if there would be any difference between them in the coming year of 1875. When that year came we had no fruit on them, but they did not make so much wood as heretofore, but formed a number of spurs all over the trees, which were covered with buds, and when the past spring arrived these proved to be flower-buds. Still, we considered that we had scarcely done enough to them in our root-pruning, so we resolved to lift them entirely, and plant again in the exact places they occupied. The one tree we left unpruned we lifted also: it was an Ickworth Imperatrice, but we left one of those that had been root-pruned unlifted; this was the Goliath. And now we come to the results.

We have had during the present year a splendid lot of plums, both for the dessert and also for tarts, but the Goliath, which had been root-pruned only, carried double the crop those trees did, which had been lifted the year after root-pruning, but our Ickworth Imperatrice never carried one fruit for us to prove its identity; but no doubt it will another season, as it, too, is now forming spurs, and has made less growth this year. The trees that were lifted last autumn have made but little wood, but carried nice crops; they consisted of Greengage, one of the very best; Washington, a very large oval, yellow fruit; Jefferson, also a large yellow, and very rich plum; and the Goliath before mentioned, which is also a large fruit of a deep red color, with a splendid bloom upon it, that adds to its beauty.

Young trees of Pond's Seedling, planted two years ago, have carried nice medium crops. The inference gained is to root-prune all gross-growing unfruitful trees. We proved the good of it years ago in the treatment of apples, pears, and even figs, besides plums, and there is no better time of the year for performing the same than the month of October. The great art of fruit-growing is to so manage our trees that they shall possess sufficient vigor to produce fruit of good quality, but not to overgrow that limit, by making good growth at the expense of a crop of fruit.

FRUIT IN TEXAS.

WE must look abroad to find out what is going on at home. A writer in Texas communicates the following interesting items to the Gardeners Chronicle of London:

Pears.—Southern Texas cannot be boasted of as a Pear country, still first-rate Pears, and heavy crops of them, too, are produced all over the State. In the northern half of the State I have seen these trees as heavily laden with fruit as I ever saw Victoria Plum trees in Mr. Dancer's market garden at Chiswick—yes, in Philip Unger's garden at Palestine it was hardly possible to get near his trees of Flemish Beauty on account of the fence-rail props that supported the groaning branches. Pear trees being expensive and slow-growing at first, as well as taking some years after planting to fruit freely, the farmers become discouraged, and the trees are often neglected in consequence, but I am confident there is a great future for Pears in Texas. Duchesse d'Angouleme is the best of all Pears for Texas, but the following have also been thoroughly tested and found most satisfactory:—Doyenne d'Ete and Madeleine, ripening from mid-May to mid-June, and succeeded by Brandy Wine, Clapp's Favorite, Bastlett, Bourre Goubalt, Howell, Flemish Beauty, Belle Lucrative, Des Nonnos, Beurre Giffard, Steven's Gennessee, Beurre d'Anjou, St. Michael Archangel, Lawrence, and Beurre Clairgean.

About as many standards as dwarfs are grown, but the raising of young Pear trees is rather uncertain; besides, we don't get that luxuriant growth rightaway as is the case in the Northern States. French Pear-stocks we use for standards, and Angers Quinces for dwarfs. We bud in September and graft in winter. In both cases the stocks are at least one year undisturbed prior to working. We never lift Pear stocks as we do Apples to graft them. Grafting or budding by contract is worth 5 dols. per 1000, Apple roots are sometimes used for Pears, but although they are productive of gross growth they so persistently bear suckers that they are a great nuisance, and on them the Pear is shortlived.

MY CENTENNIAL ORCHARD—HOW I PLANTED IT.

I HAVE just finished, November 8th, planting an orchard, ten acres in extent, of Baldwin apple trees. And this is the way I have done it.

In the first place I laid out the ground carefully, setting a short stake exactly where each tree was to stand. Stakes two rods apart each way. Two men, provided with spades, a basket of small pegs six or eight inches long, and a board about two inches wide and four feet long, having notches on one side, a half inch hole near one end, one at the center, and one near the other end, dug the holes. The holes were dug about fifteen inches deep, the top soil, which is clay-loam, being thrown together on one side and the subsoil on the other. Fine top-soil was then thrown into the bottom of the holes to the depth of six inches, and thoroughly mixed with a shovel full of fertilizer, composed of superphosphate, ashes and muck, equal parts.

When the holes were ready, the trees, thrifty four-year-olds, six to eight feet high, were carefully dug from the nursery rows with the least possible injury to the roots, broken roots were cut off smooth as well as all the side branches, leaving the body a single straight stem. The trees were immediately heeled in, and the roots thus kept moist. A boy took two or three trees only at a time directly from the pit to the men as they planted them. By the aid of the above-mentioned board and pegs the trees were set exactly where the stakes stood before the holes were dug. The holes were filled with fine soil which was trodden firmly upon the roots, and the work was finished by throwing up a mound ten inches high around each tree as a protection against mice and the force of the wind. It is my intention to put a liberal quantity of half-rotted manure around each tree, after the ground freezes. C. H. D.

Warsaw, N. Y.

SINGULAR FACT FOR MR. DARWIN.

"IN a garden at Billancourt, the property of M. Carlin, locksmith, may be seen at the present moment an Apple tree loaded with fruit. There is nothing extraordinary in this, but the stock of the tree is Cherry, on which has been grafted the Apple, a species of Golden Pippin. The fruit precisely resembles Cherries, the same stem, the same size, the same form, and nearly the same color; but its taste is that of an Apple, and it contains pips instead of stones. Specimens of this botanic phenomenon were yesterday submitted to our inspection. It must be a real curiosity, for it is generally thought impossible to graft a pip-bearing fruit on the stock of a tree-bearing stone fruit."—*Independance Belge.*

WE hope Mr. DARWIN will go and see that tree and let us know what he thinks of it.

Industrial Societies.

NORTH CAROLINA STATE FAIRS.

THE North Carolina State Fair at Raleigh, commencing on Oct. 17, was favored during the entire four days of its existence with the most delightful weather. This, with the free transit afforded by the railroads of the State to articles for exhibition, as well as the fact that less than one-third the usual rates were charged for passengers, combined with the unceasing efforts of the officers of the Society to make the Fair pleasant, ought to have called out a larger exhibit of the varied products of the "Old North State" than that displayed. Being a Northern man seeking a home in this State, I visited the Fair for the purpose of learning where and by whom the best crops and specimens of grain, vegetables, fruits, etc., were produced; also, where the best stock breeders were located—all these considerations having an influence on my selection of a home. My object, however, was but imperfectly realized, as, under the mistaken idea that it might influence the committees in making their awards, not a single card had the exhibitor's name on it.

In the Machinery Department there were three small steam engines and a general assortment of agricultural machinery, but with the exception of plows there was not much competition, there being, in most cases, but one or two machines or implements adapted to the same work. One wing of the main hall was well filled with buggies and carriages of home manufacture, and small tools, stoves and furniture. Fruit was exhibited by only three persons, and except apples, of which there were many fine specimens, there were but three quinces and a small package of wild grapes. The Dairy was represented by three samples of butter and three of cheese. A light display of very fine vegetables filled, or nearly so, one side of the eastern wing. Of corn, wheat, rye, oats and peas, good as to quality, but eleven samples were to be seen. Sewing-machines, bed-quilts, needle-work, fancy-work, photographic and other pictures, works of art, curiosities, etc., were in full force. Of poultry there were about 125 coops. One-half of the birds were quite inferior, one-quarter fair, while the remainder were really fine birds and a credit to their owners, whoever they are, and wherever they live. One Long-nose, or Piney, as they are called, one Essex boar and a few pens of Berkshires comprised the show of pigs, all of which were good, the best being a pair presented to the Society, as a special premium, by the Oneida Community—so read a card on the pen. Next in the row were the sheep, comprising one pair of fair Leicesters, another of better Southdowns, three or four more of no particular breed or special merit; then four Cashmere goats. After these some twenty cattle, mostly natives and grades, a few good Jerseys, a few good Short-Horns and two good Devons.

On the whole, the show was a creditable one as to quality, but meager as to quantity, compared with what it should have been. Let me say a word to the farmers of North Carolina: Don't let another Fair pass by without lending a helping hand, and see to it that every exhibitor's name is attached to the animal or article exhibited. Half the pleasure of seeing a fine animal or a big beet is taken away when we are unable to learn whether it was grown on the shore of Pamlico Sound, or on the top of Mount Mitchell. By the way, when I left on the evening of the second day, the Treasurer assured me of the financial success of the Fair, although the attendance so far seemed light. M. B. PRINCE.

Ridgeway, N. C., Oct. 21, 1876.

Scientific and Useful.

PHRENOLOGY.*

THE publication of a new Centennial edition of the writings of GEORGE COMBE, by S. R. WELLS & Co., the well-known publishers of works on mental science, seems to have awakened a new interest in Phrenology, of which Mr. COMBE was, at an early day, an able defender, expounder and promulgator.

The founder of Phrenology was Dr. FRANCIS JOSEPH GALL, a German, born in Wurtemburg in 1758. When only nine years old his attention was called to the fact that all his school companions who had prominent eyes had correspondingly good memory for words, and by degrees he came to learn that the certain forms of heads were always found with peculiar characteristics, either mental or moral. Being afterwards educated as a physician, he gave great attention to anatomy, particularly of the brain. He disputed the theory of those who had variously located the seat of the soul, or mind, in the heart, stomach or other parts of the body, and after many years of study and careful observation, declared as a fact, susceptible of proof, that the mind manifested itself through the brain. "This," said he, "is truth, though at enmity with the philosophy of ages."

Continued study and experiment with the brains of both man and animals satisfied him that not only was the brain the organ of the mind, but that different portions of the brain were acted upon by different mental faculties, and that the exterior surface of the skull was generally an index to the form of the brain beneath. After he had located, not without some errors, about twenty of the principal faculties, he began, in 1796, to lecture in Vienna on the subject, and was met, as most advocates of any new ideas are likely to be, with opposition, scorn and derision, and in 1802 he was directed by the Austrian Government to refrain from teachings so much at variance with preconceived ideas, and, as the Church believed, so dangerous to religion.

In 1800, came to him as a student, JOHN GASPER SPURZHEIM, who soon became strongly convinced of the soundness of GALL'S conclusions, and in 1804 they became associated in their labors. SPURZHEIM was well calculated to carry forward what GALL had so well begun. His skill as an anatomist was superior, and his investigations of the brain unveiled much that have before been hidden. He discovered and corrected some of the errors GALL had made, and located several new organs. Indeed his services in the work were such as to give him rank, second only to GALL, while many have been willing to accord him greater honor. The truth is, each complimented the other, and alone neither could have accomplished what their joint labor enabled them to do.

In 1816, SPURZHEIM visited England. The estimation in which Phrenology was held there may be inferred from the fact that such publications as the Edinburgh Review and Blackwood's Magazine spoke of it as "thorough quackery from beginning to end:" "a collection of mere absurdities without truth, connection or consistency:" "these infernal idiots, the Phrenologists." Dr. GORDON, of Edinburgh, wrote an article against it, in which he seemed to exhaust the language to find abusive epithets. SPURZHEIM immediately went to Edinburgh, and, in the presence of several hundred of Dr. GORDON'S students, proved the falsity of his assertions, so far as the construction of the brain was concerned, by dissecting one in their presence.

Among the attendants at his lectures there was GEORGE COMBE, a lawyer, who had studied carefully the various systems of mental philosophy, only to be convinced that they were founded in error. The position taken by SPURZHEIM seemed to him to be reasonable, and he concluded to give the matter a thorough investigation, believing that the general reception of phrenological ideas would create a revolution in mental science, and prove of untold advantage to the human race by giving, as it would, a sure foundation on which to base all laws, particularly those relating to crimes and punishments.

Mr. COMBE soon became strongly convinced of the truths of Phrenology, and gave, thereafter, the whole power of his intellect in its support. In 1818 he contributed a series of papers on the subject to Literary and Statistical Magazine for Scotland, which were afterward published in a separate volume, entitled, "Essays on Phrenology." A second edition being called for, it was revised and published under the name: "System of Phrenology." This passed through many editions and now ranks as one of the standard works on the science, although containing many statements which, in the light of later investigators, appeared erroneous, or at least not complete.

In 1838 Mr. COMBE visited America, giving lectures in New York, Boston, and Philadelphia. The American public were in a measure prepared for his teachings, as the works of GALL and SPURZHEIM, as well as his own System of Phrenology and Constitution of man, had been introduced and carefully read by many thinking people. Besides, as early as 1834, the brothers O. S. and L. N. Fowler had commenced lectures on the subject, and had to a considerable extent awaked discussion as to the truth of their teachings, exciting the bitter hostility of the religious world, by whom they were designated as materialistic, atheistic, and infidel.

But those days are long past, and now, although there is not a universal consent to all that is claimed for Phrenology, its leading ideas are not disputed by the press, pulpit, or people. There are but few who do not admit its general principles and acknowledge its superiority to any other system of mental philosophy ever taught. Some who do not dispute that the brain is the organ of the mind, doubt if it can be so mapped out as to show the location of faculty, while others, admitting all that is claimed for it in theory, believe that there are serious obstacles in the way of its practical utility. But as a rule it may be said the science is now most strongly opposed to those who know least about it. The Phrenologists of the present day claim that while the system is not entirely complete or perfect, it demands and deserves the acceptance of the public in so far as its claims are supported by proof, and they advance certain principles as being firmly established, among which are these:

The brain is the organ of the mind; each faculty of the mind has its separate or special organ in the brain; organs related to each other in functions are grouped together in the brain; size, other things being equal, is the measure of power; the physiological conditions of the body affect mental manifestation; any faculty may be improved by cultivation, and may deteriorate by neglect; every faculty is normally good, but liable to perversion.

* A System of Phrenology, by GEO. COMBE. [Cloth: 12mo.—pp. 816. $1.50.] New York: S. R. Wells & Co.

Lectures on Phrenology, including its application to the present and prospective condition of the United States. By GEO. COMBE, Esq., with notes, an introductory essay and historical sketch by ANDREW BOARDMAN, M. D. [Cloth; 12mo.—pp. 332. $1.50.] New York: S. R. Wells & Co.

ANCIENT HINDOO MEDICINE.

THOMAS A. WISE, M. D., late of the Medical Staff of the Bombay Army, has furnished to the

London Medical Press and Circular some remarks on the Antiquity of Medicine, from which it would seem that the ancient Hindoos, long before the Christian era, had cultivated medicine to such an extent and with so much scientific exactness as to entitle them to be accounted the founders of the modern art of healing. The following observations will be read with interest and excite some surprise in the minds of those who for the first time learn that medicine, long before the times of the Greek and Arabian writers, had been studied and discussed in written language by wise men of the East.

Dr. Wise says:—In considering the Greek system of medicine, we find their physicians and philosophers were indebted to the East for a portion of their knowledge. Pythagoras and Plato obtained many of their philosophical ideas from the Hindoos, and the internal evidence of the Greek works proves that the schools of Hippocrates derived a considerable share of their knowledge from the East. Galen mentions that Hippocrates was often at Smyrna in Asia Minor, and Mercurialis believed that he traveled in Lybia in Africa, and Scythia in Asia. Hippocrates may have visited this northern country to examine the enlightened and skilful Indo-Scythian people, whom Alexander the Great found so expert in the cure of diseases; and in these northern parts of Asia he may have consulted the Hindoo sages, and studied their drugs and medical records. The learning he was in search of was there, and the following statements prove his acquaintance with their writings:

1. The systematic works of the Hindoos were most probably prepared from the third to the sixth century B. C.; and long before the age of Hippocrates the original Ayur Veda existed, from which the other classical works were derived.

2. As medicinal plants have their properties developed in particular soils and climates, they indicate the nations among which they were first used for medicinal purposes, and explain the antiquity of the cultivation of medicine by certain races. The names and medicines recommended in the medical works of Hippocrates often indicate the schools of medicine from which they were borrowed. We find that Hippocrates used in his practice a number of Indian plants, imported from that country into Greece, for their well-known properties, such as *Sesamum Indicum*, Linn., *Hyperanthera*, *Moringa*, *Cardamomum*, *Amomum*, *Laurus*, *Cinnamomum*, *Valeriana Jatamunsi*, *Bosvellia thurifera*, *Galbanum ammoniacum*, *Sagapenum*, *Asafœtida*, etc. He also used black and long pepper, gingor, cassia, spikenard, *Calamus aromaticus*, etc., which are all the products of India or neighboring countries.

3. The internal evidence of the works of the school of Hippocrates proves them to have been compilations, derived in part from nations further advanced than the Greeks in the knowledge of particular departments of the healing art. The ancient Hindoo physicians considered dissection as a necessary part of the education of the medical practitioner. Their method was rude and imperfect, but many of their conclusions were correct, as we have proved by the result of their osteological enumeration, and the accuracy of their description of the internal organs, and of the large vessels of the body.

The ancient Hindoo surgeons performed the most difficult operations, such as the Cæsarean section, embryotomy, lithotomy, etc. The first description of the last-named operation was given by Susruta, and was afterwards made known by Celsus, who derived his information from Egyptian surgeons, and they again acquired their knowledge from the East. Hippocrates, the judicious surgeon and benevolent practitioner, allowed, it is incorrectly stated, the performance of this operation only by uneducated quacks.

From these facts it would appear that at an early age the Hindoos had made very considerable progress in the healing art, which enabled them to prepare systematic works on medicine, based on their own practical knowledge of anatomy, to which, at that time, the prejudice of mankind in general was so much opposed. Susruta informs us that an accomplished physician must possess an acquaintance with books, or theoretical knowledge, with the dissection of the human body, or anatomy, and a familiarity with the appearance of disease, or practice of medicine. This knowledge explains how the ancient system of Hindoo medicine was so complete in all its parts, and warrants the inference that several centuries were required to complete them. While the nations of the West have been slowly advancing, and mutually aiding one another, during the last two thousand years, the Hindoos, by the depressing influence of Brahminical intolerance and internal warfare, are now in a lower social condition than they were three or four centuries before the Christian era.

USING A RAZOR.

It has long been disputed whether the line of the blade of a razor should be straight or have a convex edge of considerable curvature, that is, hollowed inwards.

The matter may be settled by reference to the mode of using a razor, which is by scraping rather than cutting. Did men cut off their beards, the straight blade would be most effectual; but, as almost everyone who uses a razor, scrapes it off, the convex edge has the advantage; passing over the face obliquely from point to heel, or drawn straight downwards, it must of necessity, cut even when a straight-edged razor would do nothing but fret or tear the skin, without removing the beard. After all, it must be admitted, that the advantage—which a circular or full-edged razor has over the straight one in point of cutting, arises chiefly from a very defective manner of shaving; so long, however, as this defect exists, so long will the full-edged razor have a decided superiority. It often happens that men, groaning under the operation of shaving, attribute their bleedings and wincings to the badness of the razor when the principal fault is in themselves.*

RAZOR AND HOT WATER.

It was long supposed that the effect of dipping a razor in hot water, was to remove from its edge a kind of resinous substance, which was thought to injure its sharpness.

Such, however, is not the real effect. The fine edge is given to all blades of steel by heating them, and plumping them into cold water.

Now, it has been proved by experiment that the heat of 212° is the exact point at which razor edges are admirably tempered; and, as the heat of boiling water is 212°, by dipping a razor into it, you, as it were again temper, or give a new edge to it. E. J. R.

*Rhodes, on the manufacture of a razor. The uncertain results of tempering steel appear to be the only explanation of a low-priced razor often proving more serviceable than an expensive one.

The Vineyard.

PROTECTING GRAPE-VINES IN WINTER.

In several of the Northern States, and in the Canadas, grape-vines of all kinds require protection in winter. In some localities where there is little danger of the vines being killed down, it has been found that protection from severe cold insures increased productiveness, and we are inclined to believe that protection to the grape in winter might be practiced with benefit in many regions of country where it is now considered quite unnecessary.

A few years since, our strawberry growers would have thought it a waste of money to cover their strawberry plantations with any kind of mulch as a protection to the plants in winter, but it is now done quite extensively and as a very profitable investment. It is not done, however, because there is any great danger of the plants of the more hardy kinds being killed out by frosts, but they may be very much weakened, and the fruit-buds inclosed in the crowns during winter greatly injured by exposure, if not entirely destroyed.

Now, the fruit-buds which are to produce grapes next year are already formed on the vines, and it is quite important that they should not be injured by cold, or in any other way, if a full crop of fruit is to be obtained another season. Of course, in the warmer parts of the country, the more hardy sorts generally pass the winter unharmed, but the tender kinds require protection almost everywhere in the Middle States and the most hardy in many of the Northern States. This is well understood by most of the cultivaters of grapes; but we think few of them practice protection to so great an extent as would be found profitable through an increase of vigor in the growth of the vine and in quantity and quality of the fruit.

HOW TO PROTECT VINES.

There is a safer method of protecting vines in winter than bending down the canes and covering them with earth. Before doing this they should be pruned, leaving say one or two buds more upon each bearing cane than will be required for fruiting, as the terminal bud is more liable to injury in handling, either in layering or taking up in spring, than the others, and if they go safely through, it is a very easy matter to rub off the surplus shoots when they appear. Three or four inches in depth of earth is sufficient protection even in the coldest localities.

But it often happens that vines are trained upon some system which prevents or would make bending down to the earth in order to give protection, extremely difficult, consequently some other plan must be adopted. Where there is but a small number of vines, old sacks may be spread over both sides of the trellis, or boughs from evergreens set up against them, or almost any material which affords shade and protects the vines from cold winds, may be used, except where more protection is required. Where vines are trained against walls it will, of course, only be necessary to cover one side requiring only half the material used in protecting both.

In training vines with protection in view the stems may be set at a slight inclination in the direction they are to be bent down in the fall. A slight crook in the main stem will, after a while, be produced, but if the vines are bent down every fall there need be no fear of injury or breaking, even when the canes become large and old. A slight protection often prevents a total failure of the crop and frequently proves to be a very profitable operation.

GRAFTING THE GRAPE.

Persons who have not had very good success in grafting grapes in the spring should try performing this operation in the fall. Cut off the stocks below the surface of the ground, insert the cion in the usual way, either by a splice or cleft; tie in with bass, and draw in the earth up to a level with the top bud. Then insert a flower-pot, or box, over the cion, and then cover with soil and old hay or straw enough to prevent freezing.

In spring uncover carefully, and if the protection has been sufficient to keep out frost, the union between cion and stock will be complete. We have practiced this fall grafting many years and with uniform excellent success, in some instances making nine out of ten of the grafts grow.

Insurance Department.

INSURE YOUR PROPERTY.

Farmers as a class are inclined to undervalue the importance of insurance and to place it in the category of dispensable luxuries. Yet there is scarcely another class so much at the mercy of the careless or malignant incendiary, or for which there are so few and ineffective preventive remedies. Few people in large cities remain uninsured a single day, though they have the protection of a vigilant and effective fire department to check the conflagrations before they obtain much headway, and it seems singular that intelligent farmers neglect or omit to keep all their property covered by insurance, when they have so much to lose by a careless spark. It will not do for them to measure their faith by the chances of fire from within and of their own causing. They are too honest to burn their property for the sake of the insurance, and are as careful as other people in the use of inflammables. The insurance companies fully understand that the "moral hazard" of farm risks is less than that of any other, and that if they had only this to provide against the premiums need be small indeed. The external hazard is the heavy one—the chance that some one will thrust a lighted match into the abundance of litter that is always lying around barns, sheds and outhouses. Against this hazard there is practically no protection. The farmer cannot be continually patroling his broad acres or standing guard over his granaries. And this sort of risk has increased enormously since the era of tramps and wayfarers, who prey upon the country like an army of locusts, and who can be driven away only at the risk of all the mischief they dare perpetrate. The farmer who neglects to insure because he does not see or hear of fires in his own vicinity puts himself in the category of the party who would not insure his life because he "had never died or felt like dying." The records of a single week of the fires among farm property in this State would be too long to print, but it is a formidable list of losses of a kind which are every year increasing.

ANOTHER LIFE INSURANCE FAILURE.

The readers of the Rural will remember how constantly they have been warned to avoid all business or other complication with the Continental Life Insurance Company of New York, and how its pretensions to soundness have been discredited, notwithstanding the favorable showing it has been making. Within the last month it has been adjudged insolvent, and a receiver has, it is reported, taken possession of its effects. Yet less than a year ago it claimed more than six millions of assets and a clear surplus of nearly three-quarters of a million over all liabilities. The daily papers that chronicle this affair are full of insinuations not at all creditable to the management, which, considering the manner in which the policy holders have been dealt with for several years, is not so incredible after all. The Continental has reinsured six other companies: the Empire, the American Tontine, the Farmers' and Mechanics' and three British companies: the Commercial, the Prudential, and the International of London. It is claimed that the policy holders will be fully protected, which, whether true or not, should encourage them to continue paying their premiums to the receiver.

Field Crops.

NATURAL GRASSES.

For the past five years or more much has been said and published concerning the great value of the Natural Grasses for stock and dairy purposes; and nearly or quite all writers agree in the opinion that old sod-lands, or lands which have never had a plow in them, covered with a perfect sod and yielding good crops of natural grass and hay from year to year, are by far the most suitable for raising and fattening cattle and making butter and cheese. And as the dairy and stock-raising business is an agreeable as well as a profitable occupation, I often wonder that so few have engaged in it here in Northern Indiana. We have three persons in St. Joseph County who are fattening cattle on but a small scale, yet they are becoming wealthy, live easy, and seem to enjoy life. But there is not a butter or cheese factory in the county or in its vicinity, while Ohio on our east, Illinois on our west, and Michigan and Wisconsin on our north have each many factories making large quantities of a fine quality of butter and cheese annually, and yet their hay and pasture are no better than in Nortwestern Indiana, being much the same and, like ours, consisting mostly of natural grasses.

It seems strange to me, with the abundance of natural hay and pasture in our county, sufficient to feed milch cows for twenty or more large factories, besides raising and fattening many large herds of cattle, that the business should be so neglected here. But I suppose the reason why our farmers do not go more into stock-raising and the dairy business is because they lack the knowledge and means to conduct it properly; and yet it would not require a large capital, as farm lands suitable for the business can be had for ten dollars per acre on easy terms, or some of them might be rented at a low price for a term of years, with the privilege of purchasing at any time during the lease. These lands belong to some twenty or thirty different owners, who vary somewhat in their prices; but I know of several fine tracts of land in St. Joseph County, of from 220 to 2,000 acres each, which can be bought, and some of them could be leased, on the above terms, so that the land, with a little labor, would pay for itself in a few years.

Our farmers, being loth to engage in a business with which they are not well acquainted, and being short of means, leave to other persons, who understand the business and who have some capital, a fine opportunity to come here and select choice locations, which can yet be had, where the hay and pasture are as good for the stock and dairy business as any that can be found in the United States. These locations are well supplied with pure, living streams and springs of good water, also sufficient timber for all needed purposes, good roads, with school-houses, railroad stations, churches, etc., convenient. Many of these lands will yield annually from two to three tons of good hay per acre, such as Blue-joint, Red-top, Blue-grass, Wild Timothy, Spin-grass, Blue-stem, Sweet-scented-grass, Orchard-grass, and several other kinds of natural grasses. In some places the White Clover is fast coming in, with occasionally a little Red Clover. What I mean by the natural grasses are those which are as yet not generally cultivated, but come forth spontaneously from year to year, not costing anything for seed or cultivation, thereby saving a large amount of labor and expense. The cultivated grasses are Timothy, Clover, Alfalfa, Hungarian, Lucern, Alsike, Millet, and sometimes Orchard, Red-top, Blue-grass and some others.

I have been informed by some persons that the Kentucky Blue-grass seed was originally procured near Terre-Haute, along the Wabash River, taken to Kentucky, and in time became extensively distributed over the State. [Kentucky Blue-grass is a native of Europe, and, therefore, could not have been found "originally" in Indiana.—Ed. Rural.] It has also extended up the Wabash and Kankakee Rivers, to the northwestern part of Indiana. Certain it is that many years ago, when Terre-Coupee Prairie was first being settled, the farmers found there a grass of great nutrition and excellence, which they called Terre-Coupee-grass, but which has proved to be none other than Kentucky Blue-grass.

At all events, to my certain knowledge our natural grasses in St. Joseph County, Ind., are nutritious and excellent. Cattle pastured on them in early spring become fat and ready for the butcher much sooner than they would if pastured on the cultivated grasses, and the pastures hold out much longer, even until they are covered with snow. Especially is this the case on the bottom lands and along the streams.

Floricultural.

MICHIGAN FLORICULTURE.

Prof. Beal sends us an account of the flower beds of the Michigan Agricultural College as they have existed during the past summer. It should interest all of our readers, but more especially those who live in a climate similar to that of Lansing. Prof. Beal says:

On account of our frosty location and the short summers here, no attempt is made to use some of the bedding plants which are considered of most value further south, or in places with longer summers. Among these are Scarlet Sages, Dahlias, *Vinca alba* and *Vinca rosea*.

MOST PROMINENT PLANTS

Verbenas, with us, are very satisfactory for bedding. They are easily managed, and flower profusely for a long season. We bend them down and keep them next to the ground by small stakes. In this way the stems throw out roots. Those raised from home-grown seeds do best, as they are more thrifty and free from mildew. The difficulty in raising them from seeds is this: we do not know what colors we shall get. Some of the best varieties are Velvet Mantel, Sambo (black), Cerulea (blue), Bride (best white and sweet scented), Depane, a good old scarlet variety, which is in great demand. The Mrs. Woodruff is crimson. For bedding and ribbon beds we are especially well pleased with variegated sage (*Salvia officinalis var.*), *Alyssum*, *Centaurea gymnocarpa*, *Cineraria acanthifolia*. Some of our

RIBBON BEDS

this summer have been made up as follows: *Pelargoniums* known as General Grant for a center or the main part of the bed, with a border of *Senecio lanata* (*Gnaphalium lanatum*). The border needs a little clipping occasionally. A nice bed can be made with dark *Verbenas* (Sambo) bordered with Golden Feverfew. Remember to keep the center buds of the Feverfew picked off to prevent it running to flower.

Another bed had a Coral tree for a center (any small dense shrub would answer as well), then a ring of *Centaurea Gymnocarpa*, then a ring of *Achyranthes Lindeni*. The last is of a beautiful red color, but is inclined to grow too tall. It needs frequent pinching. Outside of the last is a row of variegated Sage (*Salvia officinalis var.*), then a row of *Alternanthera magnifica*. The above bed was too small, being only about eight feet in diameter, yet it was much admired.

Another small bed had a tree for a center, then *Artemisia acanthifolia*. This is too ragged. Then came a ring of *Centaurea candidissima*.

Another circular bed, 14 feet across, had a center of 20 small plants of *Colocasia esculenta* (*Caladium*). This burned in hot weather and did not do very well. Next came a ring of *Coleus* called Sambo or Rubra. It is a good sort, and did well. Then came a ring of *Cineraria acanthifolia*. This was rather too small to match with the rest. Next came *Achyranthes Verschaffelti*, and the next was variegated Sweet Alyssum; then Golden Feverfew; next, *Alternanthera versicolor*. In the center, instead of *Colocasia*, place *Coleus Verschaffelti*, and the bed would be made up of a good selection.

Our flat beds did better than those much elevated. The soil is rather light, and some days of our summer very hot.

We find it a great advantage to mulch with manure, about two inches thick. The plants do much better than with frequent hoeing without mulch.

FLOWERING ANNUALS.

For flowering annuals, nothing gives us greater satisfaction than good strains of *Petunia*. The best way is to save seeds, and keep saving every year after getting started with good colors. They thrive in our hot weather, and give plenty of flowers constantly after they begin until frost comes. Of great value, also, are the several sorts of *Phlox Drummondi*. No garden can afford to be without them. Pansies do well for fall and spring—in cool weather. Do not allow them to flower in hot weather, when the flowers will be small and worthless, but pinch out the head and then the plants become strong for fall use. Pansies thrive in cool, damp weather. In our short summers, *Zinnias* are very satisfactory if good sorts are used; Snap-dragon, also, and Larkspurs. *Balsams* do poorly on light soil in our summers. *Asters* of many sorts do well, but are an uncertain flower, on account of blister beetles, which sometimes appear very suddenly in immense numbers, destroying a bed in a few hours, often before the insects are noticed. Marigolds are showy and easy to manage. Place them towards the back of a garden. Mignonette is good for bouquets, and easily raised.

WALL FLOWERS.

are not very satisfactory with us. This season our stocks have done remarkably well. Sow once for an early crop and then a later sowing for a succession.

A FRAUD.

By oversight we received, in a lot of imported seed, some *Leucanthemum vulgare*. This is spoken of as rare and new, and excellent for cutting. It is nothing but Ox-eye Daisy, a most pernicious and troublesome weed. It is a rare plant on the college grounds, and on most farms of Michigan, and we hope it always may be.

WILD TRACTS NEAR NEW YORK.

But fifteen miles from the great city of New York are tracts of country as uncultivated, as wild, we might almost say as uninhabited as any hundreds of miles away. In one of these wild tracts we found ourselves one afternoon last week. It was in a deep and rather narrow valley. A long range of high hills, thickly wooded to their base on either side, shut out an extended view in all directions. Not a human habitation, a barn or hovel of any description could be seen. No human sound could be heard. The distant rattle of an occasional railroad train was the only sound that broke in upon a stillness as perfect as that of the heart of the Adirondacks or of the valley of the Yosemite. A clear, lively stream wound its irregular course through this valley, deep enough to drown one in many places, where abrupt bends had obstructed the current and spring floods had scooped out the bottom to deposit it further on in flats or hillocks that so narrowed the channel as to enable one to jump across with little effort. Trees of all sizes had fallen across this stream—here and there singly, occasionally in such numbers as to form high and shapeless entanglements wild enough to please the wildest fancy. Years and years of decayed and decaying vegetation had formed, for a hundred yards on either side, an almost bottomless accumulation of peaty mold. What would we not give for a *quantum sufficit* of this "perfect fertilizer," delivered upon our own grounds! A verdure dense to suffocation and, in places still impenetrably thick, was adding another year's growth of twigs and leaves. Evergreen Ferns, bogs of rugged Grasses, Reeds, Water Lilies, Asters, wild Vines, Swamp Azaleas, Blackberries and Raspberries, Dogwoods, Alders, Beeches, Birches, Maples, Oaks were crowded together as if the struggle for existence, where food was so bountifully supplied, were one for space alone.

Passing through this jungle and ascending the Eastern hill, we find hundreds of seedling Hemlocks, from six inches to six feet high—to us a beautiful, a rare discovery. Were there no variations among so many—no Weeping Hemlocks, no Variegated Hemlocks? Were there none with leaves distinct from those in cultivation, either broader or narrower—shorter or longer; none with habits so dense or so feathery as to be strikingly unlike all others known to nurserymen? We examined every one, hastily but carefully—hopefully at first, hopelessly at last. There was not one. Young White Pines, as shapely, some of them, as those to be found in nursery rows, were to be seen here and there, while the venerable parents, with high naked stems, towered up further down the hill-side.

A little way off we had noticed, while examining the seedling Hemlocks, a patch of bright green. This proved to be a cluster of the Mountain Laurel, all bristling with flower-buds for another season. Three or four feet in hight and thickly covering an oblong space, twenty feet in diameter, it seemed by its formal outline to have been arranged there by the hand of man.

Such wild, luxuriant tracts are not to be met with every day within fifteen miles of great New York. Less often does one meet with Hemlock, White Pine and Kalmia seedlings existing in such numbers as we have described. But, as if they were oases in a desert, they are the more highly prized when we do hit upon them and one enjoys the knowledge that an hour's ride and an hour's walk may even yet afford a glimpse of nature before she has been patched up and tortured by the march of civilization.

NOTES.

A Request.—If any of our floricultural readers will forward us a list of the names of their floricultural friends, together with their address, we will be happy to forward to each a copy of the Rural New-Yorker. A postal-card will suffice for such lists. Please write name, town, county and state plainly.

New Annual.—Among Annuals, those at best uncertain plants, a *Godetia* named Lady Albemarle seems worthy of trial. The Gardeners' Magazine says that it is an extremely beautiful variety, bearing flowers quite four inches in diameter and of a glowing, crimson color. It is bushy and the flowers are produced in the most compact manner possible.

The Journal of Horticulture says:—The flowers are not unlike those of *Dipladenia crassinoda*, with the rich crimson shade of the newer varieties, but far exceeding those in the rich, silky appearance, at a time, too, when many of the best annuals were burnt up with drought. Not one other annual or bedding plant can compare with it in producing such a mass of dwarf, dense plants, the foliage being entirely covered with flowers.

The London Garden says that it is a very effective dwarf, free-flowering plant, raised by Messrs. Daniels Bros., Norwich, Eng. It is a hardy annual which grows from 9 to 15 inches in hight and bears glowing, carmine flowers; as a pot plant it is most effective.

Land and Water says this splendid new annual has just been exhibited at one of the meetings of the Royal H. S. and awarded a first-class certificate of merit. It was obtained by crossing the old *Godetia Lindleyana* with *G. Whitneyi*, and is a fine and striking addition to our showy annuals.

With such strong commendations, we think our seedsmen may venture to offer this as a novelty for 1877.

The Apiarian.

WINTERING BEES.

There are three ways of wintering bees—on their summer stands, in cellars, and in winter bee-houses. In the Middle and Southern States, it is best to winter them on their summer stands, with protection around the hives where the winters are cold, as in New Jersey, Delaware, and other States in the same latitude, or further South.

When hives are set about a foot apart upon low stands they may be protected by driving stakes on both sides of them, (front and rear), and at the ends; and then fill in compactly all around them with hay or straw, two or three inches thick, with a temporary roof of boards to keep the straw dry. This protection is sufficient for any latitude, however cold it may be, and enables the bees to winter with as little loss generally as occurs under any other system. The passage-ways to the hives must not be obstructed by the straw, as the bees will require an occasional flight in mild weather.

Another way is to have cheap, outside boxes made, open at both ends, which are to be placed over the hives, and the open space (two or three inches) on each side filled with straw packed in firmly. A hole in each box, cut out in front of the openings in the hives, having something placed in it to keep the passage-way from being shut up with straw, will afford the bees egress and ingress, when it is safe to allow them to take a flight.

In very cold climates, as the New England States, and running west through Central and Northern New York, Michigan, Wisconsin and Minnesota, the prevailing opinion of bee-keepers is, that bees winter best in bee-houses made so that the thermometer never falls below the freezing point—a difficult thing to effect in very cold winters. Such houses are made above ground generally, being boarded up on the inside, and the space between the studs packed with sawdust, and a floor laid across at the plates, and the open space above filled with straw. Ventilation is effected by a conductor about six inches square inside, running from the floor across the plates through the ridge of the building, and always kept open. There should also be a conductor running under the sill on the North, or West side, with an elbow about two feet long on the outside to come above ordinary snows. This ventilator should have a sliding guage to let in air according to the temperature outside.

If bees could be put into such a home as Winter approaches, and their owner have no further care in regard to them till spring, and then bring them out all in good condition, bee-keeping, in all cases where the honey harvest is abundant, would be a grand success. But no bee-keeper, with his bees thus homed, knows what a few days may bring forth. If the weather is intensely cold for several weeks, and the frost gets into the building, many of his families of bees may perish. Then if a warm "spell" takes place—a few days like May weather—there is trouble from the bees becoming aroused, and trying to escape from their confinement.

The requirements to winter bees in cellars are dryness and darkness with the thermometer ranging from 35 to 45 degrees; but it sometimes runs up to 50 or 60 deg., and then as in bee-houses, the bees make great efforts to leave their hives, being shut in with wirecloth over the passage-ways. To guard against the bees being smothered, in consequence of rushing in large numbers to the passage-ways, it is advisable to raise the hives from their stands an eighth of an inch, placing wedges under the corners. During the last ten years I think the entire increase of bees in the United States has disappeared by disasters to them in wintering—that is, that we have no more bees in the aggregate now than we had 10 years ago. Frequently a writer will say, "I have followed this or that plan in wintering my bees, and for seasons I have lost none," thus conveying the idea that his plan is a success every year. But not one of such statements that have appeared during the last 25 years has proved, or can prove, to be a success in all cases. For instance, take the statement of a writer in the Rural of Oct. 28th. He thinks that he has found a remedy for all the ills to which honey-bees are subject in winter, by making holes through the combs, so that the bees may pass easily from one comb to another in cold weather to obtain honey. If he lost no bees during two or three winters, it was not owing to the holes in the combs, but to the mild winters, or the condition of his bees in the fall. Holes have been made in combs many years; yet there is no proof that they are of much benefit, if of any at all, because the bees leave side openings, when they build their combs; and when the weather is mild enough to allow them to pass through a center opening they can pass through the openings at the sides of the combs.

If we take the trouble to ascertain what experience most writers on bees in the bee-magazines have had, we find that they are mere novices, frequently commencing a communication that they imagine will enlighten the world on bee-keeping, with "this is the second year I have kept bees."

When they have kept them 10 or 15 years they begin to find out that they know but little, comparatively speaking, on this subject, which is worthy of being considered one of the most obstruse studies of insect life. T. B. Miner.

London, N. J.

Farm Economy.

LITTER OR BEDDING FOR CATTLE.

The Scientific Farmer, in a late issue gives quite a lengthy article, on the subject of litter in which the analyses of various materials used for this purpose are given in detail, in order that the farmer may know their relative values when reduced to what is generally termed manure.

But we presume few of our farmers are as much interested in the chemical constituents of the material employed for bedding their stock, as they are in its cheapness and the facility with which it can be obtained, consequently in making some extracts from the article referred to, we omit the analyses, merely mentioning the relative values in which the materials named are held by chemists.

In suburban localities where straw is but little grown, and even meadow hay commands a price, the farmer is often puzzled how to procure litter for his animals at a cheap rate. Usually the cattle are not bedded at all, but a small quantity of dry earth is scattered under them to act as an absorbent, and to facilitate the keeping of the floor clean. Horses, however, require bedding, and are usually bedded on straw, the poorer qualities of hay, or on sawdust or leaves.

Stock can be kept comfortably in all these ways, and which method it is best to adopt is to be determined by the circumstances of the farm and the personal taste of the owner. Yet when the question of the manure comes up, we find a divergence of opinion, especially on the value of the saw-dust and leaves in the compost. That saw-dust may be detrimental to land we are willing to admit, and also that it may be beneficial. On light soils, in moderate quantity, we have found no evil effect resulting from its use when used under the horses, and then passed to the manure heap. Indeed, when we consider how easily the sawdust is handled, how cheaply it is to be procured, and how well it is adapted to bedding the farm horse, we are disposed to advocate its more extended use. In our own practice, but a small portion, that which has become soiled, is taken from the stall each day, while the balance is swept forward, under the fore-feet, during the day time, to be spread backward towards night.

We do not prefer saw-dust, however, to straw or hay. But straw is too costly, and hay, even if of a poor quality, can ordinarily be fed out to the cattle with advantage, provided we feed judiciously and in combination with other foods. However used, hay finds its way ultimately to the manure heap, as should everything of this nature consumed or used on the farm.

In our own practice dry earth may be considered under the head of litter. The cattle stand on a slightly sloping floor, with a trench behind them. Each day a few quarts of dry earth are evenly spread under them, and at times during the day a hoe is used to remove droppings which have fallen outside the trench. Thus our cattle are readily kept clean, and the barn air is not overladen with ammoniacal odors. When earth is not readily obtainable, we think saw-dust would take its place. But it should not be used in large bulks, or heaped about the floor. A light sprinkling, on the same principle that applies when it is dampened and used as an aid in the sweeping of a floor in a hotel, is sufficient.

The manurial value of litter used in the way

we have indicated is but slight. Of course there is some addition to the food value of the manure heap by the use of soil, but it is of too slight a value to be dwelt upon. The physical action of the mixing is of more consequence.

A ton of saw-dust would contain but 1.2 lbs. of potash and less than half a pound of phosphoric acid. Indeed beech saw-dust is composed per ton of 1,989 lbs. of organic matter, principally carbon, and white pine saw-dust of 1,995 lbs.

Autumn leaves are far richer in percentage of ash element than saw-dust. Yet on account of their lightness, they possess but a small amount of plant food according to their bulk. To mix with manure, however, leaves are of considerable value, from their mechanical effect, as they tend to lighten up the manure heap, and by their decomposition, aid in the fermentative changes.

Straw, on the contrary, has considerable value of ash element which it contributes to the manure, and so has hay, even of the inferior qualities.

We can not find an ash analysis of meadow or bog hay which will answer our purpose, but judging from the proximate analysis given, we may assume, with a good deal of certainty, that a bog hay will yield half the quantity of fertile ash element as will the good hay.

To sum up the main points made in a few words, it may be said that the richer the materials used for bedding, the more valuable the manure made therefrom.

GATHER PURE ICE.

No one should know more about ice, whether pure or otherwise, than those who live in Canada, consequently we are inclined to think the Canada Farmer is about right in saying that some books on Arctic travel, are answerable for the widespread notion that ice is pure and fresh when formed on water, no matter how impure or salt. It may be the fact that the ice itself is chemically pure, but if that ice holds in suspension filth or salt which will combine again with the water on the melting of the ice, then the notion that such ice is pure, is for all practical purposes, a delusion and a sham. Rather than propagate such stories, it were better, even if on that account alone, such books had not been written.

An epidemic of fever and diarrhœa at one of the hotels at Rye Beach this summer has been clearly traced to the ice. This had been procured from a pond of which the outlet had in recent years been closed by sand and stones washed up from the sea, the pond thus becoming a standing receptacle of mud and sawdust, there being two saw-mills on the stream above. The ice was subjected to chemical analysis, and was found to contain putrescent vegetable matter. The hotel stopped using this contaminated ice, and there was an end to the sickness among its boarders.

In these days when so many farmers (that there may be more of them is our wish), put up ice for home or dairy use, it will be well for them to bear this fact in mind. If the water of a pond is unfit to drink, the ice made from that water is unfit to use for cooling purposes, except when the ice is outside the vessel containing the articles that are desired to be cooled. City people will also do well to ascertain something about the source from which their ice-man draws his supplies. We believe it to be scandalously filthy in some instances.

Domestic Economy.

ORIGINAL RECIPES.

Silver Cake.—Whites of 6 eggs, ½ cup butter, 2 cups sugar, ¾ cup sweet milk, 1 teaspoon cream of tartar, ½ teaspoon soda, nearly 3 cups sifted flour. Dissolve the soda in the milk, and mix the cream of tartar in the flour. Flavor.

Gold Cake.—Use the yelks instead of the whites of the eggs, then make the same as Silver cake.

Fried Cakes.—2 eggs, 2 cups sugar, 2 cups thin sour cream, (or one of cream and one of buttermilk), 1½ teaspoon saleratus, ¾ teaspoon salt. Mix soft.

Cream Cookies.—1 cup sugar, 1 cup rich sour cream, ¾ teaspoon saleratus, a little salt, nutmeg. Mix as little as possible, and just stiff enough to roll out.

Wedding Fruit Cake.—16 eggs, the yelks and whites separated; 2 lbs. brown sugar with the yelks, 2 lbs. butter, 4 lbs. raisins, 2 lbs. currants, 1 lb. citron, 2½ teaspoons saleratus, dissolved in ½ glass brandy, 4 nutmegs, 3 tablespoons cloves, 3 tablespoons cinnamon, 2 lbs. flour. Mix one half of the flour with the fruit, then stir into the cake. Beat the whites of the eggs to a froth, then put in a little of the froth, and the remaining lb. of flour, each alternately till it is all in.

Feeling confident that some farmer's daughter will try the last recipe during the coming winter, I take this opportunity to wish her success with the cake, and in her new relation all the happiness mortals are allowed. MRS. S. C.

SELECTED RECIPES.

Cooking Jerusalem Artichokes.—Wash the Artichokes, pare them, boil for twenty minutes until they are quite tender; drain them, and pour good melted butter or white sauce over them. Boil them for about twelve minutes; lift them out, drain them carefully, and let them cool; dip them into beaten egg, and cover them with fine bread crumbs; fry them a light brown, and serve them directly.

Jerusalem Artichoke Soup.—Boil 3 lbs. of Artichokes in water for ten minutes, lift them out, and slice them into three pints of boiling stock, which has been well flavored with Onions, Carrots, Herbs, &c. Let them stew for twenty minutes, press them with the soup through a fine sieve, and put the whole into a clean saucepan, with a pint-and-a-half more stock; season this with salt, cayenne, a little mace, and a lump of sugar. Let it simmer two or three minutes, and stir into it a pint of rich cream. Milk may be used instead of this last, but 2 or 3 ozs. of butter must then be added.

The above are from the last number of the London Garden, one of the best papers of its class published in Europe.

Carrots instead of Eggs.—An exchange says: It is not generally known that boiled carrots, when properly prepared, form an excellent substitute for eggs in pudding. They must, for this purpose, be boiled and mashed, and passed through a coarse cloth or hair sieve strainer. The pulp is then introduced among the other ingredients of the pudding, to the total omission of eggs. A pudding made up in this way is much lighter than where eggs are used, and is much more palatable. On the principle of economy, this fact is worthy of the prudent housewife's attention.

Baking Apples.—Buy a small tin applecorer; core with it as many apples as you want, without peeling them; set them on a tin dish; place this in a hot oven, having first filled up the vacancies left by your surgery with the best of sugar. Let them bake till they are well done. Take them out, and if you do not know what to do next, call in your nearest and best friend for further advice.

Dried Green Peas.—Wash the peas, pour boiling soft water over them, sufficient to cover. Let them stand over night. Stew them for several hours, or until they are soft and pulpy. Add boiling water occasionally, and keep them covered closely while cooking. Add half a cup of cream and a little salt, and boil ten minutes; then dish up.

How to Make the Tea Go Further.—A method has been discovered for making more than the usual quantity of tea from any given quantity of the leaf. The whole secret consists in steaming the leaf before steeping. By this process, it is said, 14 pints of good quality may be brewed from one ounce of tea.

Dessert of Apples.—Make of a pound of sugar a rich syrup; into this put a pound of apples pared and cored, and stew till they are soft; mix them smoothly with the syrup and form into a mold. Into a pint of cream or new milk stir the yelks of two eggs, a half cup of sugar, a spoonful of rose water, and let the whole boil in a farina kettle. When cool pour it around the apples, and serve.

Vienna Coffee.—Mrs. A. L. H. of Boston, Mass., since her return from a visit to Philadelphia, where she tasted the celebrated Vienna coffee, has been making some for herself, and sends the following for the readers of the Tribune: "I leach the coffee, allowing to each person a tablespoonful of ground coffee, and one extra for the pot; then to one quart of cream, put into a pitcher and set in boiling water, I allow the white of one egg beaten to a froth; then I add three tablespoonfuls of cold milk to the egg, and mix it well; then remove the cream when hot from the fire, and add the egg, stirring it briskly for a few seconds; then serve. This gives a cup of coffee equal to that at the Vienna Bakery."

BRINE TO PRESERVE BUTTER A YEAR.

Among the many devices for keeping butter in a manner that will preserve the fresh, rosy flavor of the new, with all its sweetness, is the following, from Duchess Farmer, which is said to be entirely successful:

To three gallons of brine, strong enough to bear an egg, add a quarter of a pound of nice white sugar and one tablespoonful of saltpeter. Boil the brine, and when it is cold, strain carefully. Make your butter into rolls, and wrap each separately in a clean, white muslin cloth, tying it up with a string. Pack a large jar full, weight the butter down, and pour over it the brine until all is submerged. This will keep really good butter perfectly sweet and fresh for a whole year. Be careful not to put upon ice butter that you wish to keep for any length of time. In Summer, when the heat will not admit of small jars, take large ones, and, using the same brine, allow it to cover the butter to the depth of at least four inches. This excludes the air, and answers as well as the first method suggested.

Hygienic Information.

POSTURE.

An erect bodily attitude, says Dr. GREENE, is of vastly more importance to health than is generally imagined. Crooked bodily positions, maintained for any length of time, are always injurious, whether sitting, standing, or lying—whether sleeping or waking.

To sit with the body leaning forward on the stomach, on to one side, with the heels elevated to a level with the head, is not only in bad taste, but exceedingly detrimental to health. It cramps the stomach, presses the vital organs, interrupts the free motions of the chest, and enfeebles the functions of the abdominal and thoric organs, and, in fact, unbalances the whole muscular system.

Many children become slightly humpbacked, or severely round-shouldered, by sleeping with the head raised on a high pillow. When any person finds it easier to sit, stand, or sleep in a crooked position than a straight one, he may be sure his muscular system is badly deranged, and the more careful he is to preserve a straight or an upright position, and get back to Nature again, the better.

Those persons engaged in occupations requiring the hands alone to move, while the lower limbs remain motionless, should bear in mind that without frequent raising the frame to an erect position, and giving exercise to all parts of the body, such a practice will tend to destroy their health. They should also sit in as erect a position as possible. With seamstresses, there is always more or less stooping of the head and shoulders, tending to retard circulation, respiration and digestion, and produce curvature of the spine. The head should be thrown back to give the lungs full play. Health cannot be without free respiration. Strength and general health must come from exercise. Confined attitudes are in violation of correct theories of healthy physical developments and the instincts of nature. Those accustomed to sit writing for hours, day after day, can form some idea of the exhausting nature of the toilsome and poorly-paid labor of the seamstress.

Parents and guardians should see to it, that those under their care maintain an erect posture, and keep the system in harmony with the laws of life, especially during the period of growth. And persons who, from necessity, are obliged to remain for a time in unnatural or cramped positions, should overcome the evil, as far as possible, by proper exercise in the open air and other means of maintaining the strength, vigor, harmony and beauty of their physical constitutions.

ON THE PRESERVATION OF ICE AT THE BEDSIDE.

Mr. SAMPSON GAMGEE, Surgeon to the Queen's Hospital, Birmingham, in a short article (Lancet, June 10, 1876) calls attention to this subject. His practice for some years has been to cut a piece of flannel about nine inches square, and secure it by ligature round the mouth of an ordinary tumbler, so as to leave a cup-shaped depression of flannel within the tumbler to about half its depth. In the flannel cup so constructed pieces of ice may be preserved many hours, all the longer if a piece of flannel from four to five inches square be used as a loose cover to the ice-cup. Cheap flannel, with comparatively open meshes, is preferable, as the water easily drains through it and the ice is thus kept quite dry. When good flannel with close texture is employed, a small hole must be made in the bottom of the flannel cup, otherwise it holds the water, and facilitates the melting of the ice, which is, nevertheless, preserved much longer than in the naked cup or tumbler.

In a room 60° F., Dr. G. made the following experiment with four tumblers, placing in each two ounces of ice, broken into pieces of the average size of sucking. In tumbler No. 1 the ice was loose. It had all melted in two hours and fifty-five minutes. In tumbler No. 2 the ice was suspended in the tumbler in a cup made, as above described, of good Welsh flannel. In five hours and a quarter the flannel cup was more than half filled with water, with some pieces of ice floating in it; in another hour and a quarter (six hours and a half from the commencement) the flannel cup was nearly filled with water, and no ice remained. In tumbler No. 3 the ice was suspended in a flannel cup made in the same manner and of the same material as in No. 2; but in No. 3 a hole, capable of admitting a quill pen, had been made in the bottom of the flannel cup, with the effect of protracting the total liquefaction of the two ounces of ice to a period of eight hours and three quarters. In tumbler No. 4 two ounces of ice were placed in a flannel cup, made, as above described, of cheap, open flannel (10*d.* per yard), which allowed the water to drain through very readily. Ten hours and ten minutes elapsed before all this ice had melted.

A reserve supply outside the bedroom door can be secured by making a flannel cup, on the plan above described, in a jug, and filling it with little lumps of ice—care being taken that there is space enough below the bag to allow the water to collect and leave the ice dry. This provision will allow ice to be used during the hottest night, without the supply failing, or the patient being disturbed—two very important considerations. The real therapeutic benefit of ice is only produced in some cases by its free use, and its soothing and stilling effect must be aided by the most perfect surrounding quiet.

BISULPHIDE OF CARBON AS AN ANTISEPTIC.

In the course of some recent investigations, says the Boston Journal of Chemistry, M. Zoller, of the Gottingen Academy, was led to study the properties of bisulphide of carbon as a preserving and disinfecting substance. Beef and veal, in quantities of 250 to 1,000 grams, were put under glass bell-jars, at a temperature between 15° and 40° C., a little of the bisulphide being also present, and were kept there thirty-two days. The meat showed no sign of corruption; it retained its elasticity, and was only altered in color, becoming slightly pale. The same experiment was made with poultry, and with equally favorable results. Rye and wheaten bread was exposed fourteen days in moist air containing the bisulphide, and it had not the slightest appearance of mold. Over-ripe plums kept for 182 days just as well; there was neither mold nor putrefaction. Two portions of sugar solution, with a little yeast added, soon went into strong fermentation. One of the fermenting liquids was put under the bell-jar, and after twelve hours the fermentation was hardly perceptible. M. Zoller thinks he is warranted in considering bisulphide of carbon a powerful means of preservation and disinfection—the more powerful, because, even at ordinary temperature, it volatilizes; and, in an air space, containing comparatively little of the vapor, all formation of mold or putrefaction is prevented.

THE BREAD PROBLEM.

The Nation has its say on this question of good bread, and we are constrained to think is very nearly if not quite correct.

The bread problem is undoubtedly, so far as the American people are concerned, the most important which we have to solve. Dyspepsia is our national curse. It is the source of the greatest sufferings and the greatest weaknesses of the American people, and it is pretty generally conceded that among the factors of our national disease none is so important and none so universal as the bad quality of our national bread. The excessive using of tobacco, of coffee, of tea, and of whisky certainly has much to do with our enfeebled digestions, but all these together must sink into insignificance when compared with the vile character of what is known as bread in ninety-nine-hundredths of the households of our country—sour, heavy, sawdusty, innutritious, unpalatable stuffing, which performs, of course, a certain useful office in nutrition, but which at the same time makes such serious demands upon the converting powers of the stomach as to leave the digestive apparatus of most of our people, even before attaining middle age, in such a wrecked and ruined condition as destroys much of the comfort, happiness and usefulness of their later years.

EXERCISE OF THE STOMACH.

Your correspondent Mr. PECK, in his hygienic articles, speaks as if those articles of food which are the most easily digested are necessarily the most healthful. This is well known not to be the fact, or as a rule it has many exceptions. The stomach needs exercise the same as the muscles. Bulk is, therefore, essential, as well as nutritious, easily-digested food in small quantities. Distension of the stomach is its exercise, in the absence of which its powers are weakened. M. D.

[This is all true enough; but we were not aware that Dr. PECK had so stated.—ED.]

FOOD FOR INFANTS.—When an infant evinces disgust at food, give it cold water, a ripe tomato, beef tea, toast water and arrow root, yelk of egg beaten with sugar, and a little good claret added, or a piece of salt pork well boiled. The above to be given sparingly and with appropriate discretion.

"PROGRESS AND IMPROVEMENT."

THE RURAL NEW-YORKER,

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

ANDREW S. FULLER, Editor.

ELBERT S. CARMAN, - - Associate Editor.

WASTE OF MONEY.

"ECONOMY in public expenditures," says the candidate for office, "is the motto upon which I desire to come before the people," and straightway he sits down and calculates the cost of his successful candidacy. His assessment must be paid to his General Committee and the usual contributions must be made toward the holding of meetings in his interest, while certain other sums must be appropriated to defray the usual necessary (?) expenses of the campaign. What campaign, forsooth? What is a campaign? WEBSTER defines it as "the time that an army keeps the field, either in action, marches or in camp," and no more appropriate word could be used to describe the scenes of activity through which the anxious candidate passes from the time just preceding his nomination for office, till his election or defeat at the polls. He makes constant war upon the political, religious and personal prejudices of his opponents, and just as persistently coaches the weak-kneed of his own way of thinking. In doing all this he pours out oceans of money. For what good? Is the community benefited by this expenditure—nay, waste—of money? No. It is all wrong. We are a producing people and generally a sensible people; but in this one little matter—of the exercise of the sovereign right of citizenship—we are somewhat "slack." This lavish waste is not confined to any one party or set of individuals; but has grown to be general throughout the country.

The ordeal of the Presidential election through which we have just passed is proof to the thinking mind, of the truth of these assertions and, now it is all over, would it not be well to look the matter calmly in the face, with a view to its abatement? The one party will say that if we fail to do all these things the other party will certainly do them, and thereby get votes which rightfully belong to us. Let them have such votes. What is lost by buncombe this year will be more than regained by sober thought the next year. Then think too, of the actual millions of dollars which have been positively thrown away in the "campaign" just passed! The money is put into circulation, to be sure; but what kind of circulation? Take, for example, the individual generally called the "worker at the polls," who receives all the way from one to twenty dollars for his day's work. Where does a large part of his pay go? Generally chosen from among the lowest and most vicious class, he naturally spends the larger part of his wages in keeping up the party enthusiasm at the nearest grog shop. All money so spent is certainly wasted, though it is put into circulation. The TWEED Ring made great claims to the people's gratitude for putting their stolen treasure into circulation, and the citizens of their locality are even now paying the penalty. These pictures are not overdrawn. They are matters of such constant occurrence in most localities that the exceptions only prove the rule.

It is all wrong. Suffrage enjoyed at such an expense is a luxury which we cannot afford. Money so circulated appeals to and nourishes the worst passions of humanity, and in addition to its wastefulness is productive of an undercurrent of demoralization which all the churches, missionary societies, and charitable institutions in the country are powerless to counteract. Let us discountenance what are called "election expenses." To be sure, there are laws against thus using money; but these laws, like those against gambling, are only enforced where public opinion demands it. Each one of us forms an integral part of this public opinion, and it is only by the individual effort of each of these integral parts that such things can be discountenanced, and such practices be made obsolete. In watching the effects of these expenditures, as we have for many years, we have become satisfied that public opinion must, ere long, seize the monster and grapple with it, or our liberties are endangered. It is confined to no particular party, but has become the rule on both sides. Hence its danger. These reforms must emanate from the Rural population, for the cities will never start them. We therefore call upon our agricultural, producing class who, above all people, are made to feel any lack of economy, to join hands, without distinction of party or politics, and put an end to this fearful extravagance—this wicked waste of money every year about election time. It can be done if the people will unite, and done right easily, too. Try it!

A CHEERFUL TONE.

DURING the past few weeks business men have talked in a more cheerful tone than for some time previously, and this seems to inspire confidence in all the various industries, which is but another instance where mere words or the manner of uttering them, may change the aspect of affairs in a community or country. It is certainly a good sign of an improvement in financial circles when men begin to talk encouragingly of future prosperity, for a returning faith in the present and what may come, is second only in value to a positive realization of the thing sought. The facts will probably bear us out in asserting that the country has at no time in the past half century, been richer than during these very times of stagnation in business; but there has been a lack of confidence, or faith, in the substantiality of our wealth, and this has caused inactivity in trade. The "flush times" during the war, brought a legitimate result—a corresponding reverse of circumstances. Those who were injured most cried the loudest about hard times and general depression in business, and this cry was taken up and re-echoed through the land. Thousands who had no other reason than the one "everybody said so," piped upon the same note and immediately commenced to practice economy, and restrict their expenses and investments. "Tidal waves" in business circles may originate from very slight causes, but gain strength as they progress, and their speed is accelerated more through removal of obstacles than additions of force.

The late hotly-contested political canvass has doubtless furnished our readers with numerous instances of the effect cheerful tones and wild huzzas have upon men of various temperaments. Upon some, the effect of a cheer may not be so apparent as upon others; still, all are likely to feel the magnetic influence of the combined effort of a large assembly when responding with one accord to some sentiment expressed. Loss of confidence in men or things is, at best, a disaster generally to be avoided if possible, and we have had enough of this among us for several years past. It is time that we all joined in proclaiming that the hard times are over and that good ones have come and, by putting faith in our words, accompanying them with actions, we will bring what each and every one desires—namely, sound, substantial progress and improvement in business from this time henceforth, until some dire calamity again befalls the nation.

HAPPINESS AT HOME.

IT has been said by a philosopher that every cross word uttered or angry feeling experienced, leaves its unerring mark on the face. This can be verified by a close observation of the countenances of those around us whose tempers and habits are familiar to us, and its truth thus established. And if the lineaments of the face show traces of such things, how much more must the general, moral and mental system be affected by them? Nothing is more susceptible of proof than the statement that one angry word brings on another, except the good old biblical saying, that "a soft word turneth away wrath." Many people, really possessed of a sincere desire to do right in all things, allow themselves to fall into the habit of using ungentle and even unkind words to those around them when, if their attention were called to the fact in the right way, they would be astonished at themselves. They mean no harm, but they *do* harm, both to themselves and to their associates. More especially is this harm perceptible in the family circle, where the developing child is the proud imitator of all the acts of its elders, and particularly those which are pronounced and noticeable. Here is where the carelessly sown seeds of ungentleness are eventually ripened into a harvest of harshness and too often gathered in a crop of vice and crime. Too frequently are these sins of the parents visited upon the children, even of the third and fourth generation.

This all results from a lack of full appreciation of the meaning of HAPPINESS AT HOME. Happiness is made, not born. It may with reason be argued that it is an impossibility to be happy at home when one is crushed by the cares of life—by difficulties crowding on every side. But that brings us to the very point we are seeking and leads us to repeat, that happiness is made, not born. If a man firmly resolves to throw aside the vexing cares of business, or a woman the aggravations of domestic life, when the family is united, as most families are once in twenty-four hours, the thing is done. After the excitements of the day the nerves are naturally pretty "high strung," and an effort is required to prevent their disturbance upon the slightest provocation; but each effort renders its successor easier of accomplishment. Thus, a habit of gentleness, cheerfulness and kindliness can be acquired, which nobody sees but to appreciate, admire and desire. The children acquire it in youth and are saved the subsequent efforts at self-control, while the neighbors are softened by contact with it, and the result is what we all should seek—HAPPINESS AT HOME.

RURAL NOTES.

Subscribers and Agents!—Again we are called upon by the many flattering letters from subscribers and agents to thank the former for their kindly feelings towards the "Old RURAL" and to express our obligations to the latter for the earnest efforts now evidently being made by them on our behalf. We do not take this personally to ourself, but to the paper, which includes the whole corps of Editors and contributors who so generously combine in the illumination of our pages each week. Let us say also, in our reply to the many questions as to the welfare of the RURAL, that, while we are not in expectation of dazzling the world in a day, we are making steady progress and counting a steady increase of our list each month. For this we have to thank our subscribers and agents, the effects of whose efforts in our behalf we are constantly feeling, and whose congratulations are our best reward.

Editors' Good Nature.—Mr. THOS. MEEHAN, Editor of the Gardeners' Monthly, like many other men of his profession, is not only good-natured, but enjoys a sharp criticism, especially when his critic tumbles into a pit of his own digging. In the last number of the Monthly we notice a correspondent scolds the editor for speaking of the common garden Hydrangea as *H. hortensis*, claiming that it should have been spelled "Hortensia," adding that it was named after Queen HORTENSE—all of which Mr. MEEHAN publishes with thanks to the critic, never as much as hinting that "Hortensis" is from *Hortus*, a garden; hence the common name of the species, notwithstanding the very "Frenchy" story about Queen HORTENSE who, by the way, was a little miss of five years at the time the above Hydrangea was introduced into English gardens from China.

The Boston Cultivator.—Among the multifarious changes in Newspaperdom we note with feelings of regret the retirement of Mr. ORIS BREWER who, for nearly forty years, has published the Cultivator. It is to be consolidated with the New England Rural Home and issued, increased in size and reduced in price, as the American Cultivator. The staff will be GEO. B. JAMES, Editor and Publisher; M. M. BALLOU, Associate Editor; LEANDER WETHERELL, Agricultural Editor, and C. M. HOVEY, Horticultural Editor. With such men at the head of its respective Departments, the AMERICAN CULTIVATOR can hardly fail of the splendid success which we wish for it.

American Vines in France.—The demand for some of our most vigorous growing varieties is still active in France for stocks upon which to graft the foreign sorts, as a preventive against the ravages of the much-dreaded *Phylloxera*. This minute insect appears to attack all the species and varieties, but some are of such a vigorous habit that they make a good growth even when the parasite is abundant on their roots. The French vineyardists speak of these varieties as those capable of resisting the *Phylloxera*.

RURAL BREVITIES.

THE Turk is a harem-scarem fellow.

SOCIALISM is organized leisure, and a socialist a democrat who desires privileges.

CALIFORNIANS report great success in killing squirrels by using squashes poisoned with strychnine.

"A NEW YORK awning fell upon a citizen and he received $1,800 damages."—*Ex.* What a duck of a man—a canvas-back!

FARMER to Capatalist:—"Have you had the grasshoppers?" C. to F. "No: have had the measles, though!" (*Sensation.*)

LADIES' literary societies seem to spring up all over the West. These springs are what make the "well of English undefiled," we suppose.

DECORATIVE art has made great strides since election. We have seen several voters with sculptured fagades, mostly in the eyeonic style.

TENNYSON is now sixty-six years old. What is to be thought of a man who at this age goes about singing: "Come into the garden, Maud."

WELLS, RICHARDSON & Co., Burlington, Vt., have introduced a new "Perfected Butter Color" which, they say, is meeting with great success among dairymen.

THEY now grind mummies into paint. This is important to ladies. No tell-tale blush would mantle the alabaster cheek, if this silent cosmetique is used.

RUTABAGA, while returning to his reservation, somewhat late in the evening, was asked by a friend what his wife would say. "I'm (hic) like misser Hilden and Hays—still (hic) in doubt.'"

THE sewage question still attracts considerable attention in England, and while one party asserts that grass grown on land fertilized by the sewage of cities is unwholesome and affects injuriously the milk of cows fed upon it, another party denies it and calls for proof.

THE new catalogue of Pomona Nursery, WM. PARRY, Cinnamon, N. J., has just reached us. Mr. PARRY'S specialty is small fruits, and all who are interested in this branch of Horticulture should send to him for a catalogue before purchasing. He has had thirty-eight years' experience in this branch of the industry.

☞ THE Hon. MARSHALL P. WILDER, President of the Am. Pom. Society, was unable to visit the Centennial at the time of the principal fruit show, on account of illness; but he sent 300 varieties of pears, which the members of the Society may well have considered as a fair indication of the "spirit" of their Pomological chief,

ANDENKEN.

I THINK of thee when the forest trees
Bend to the whisp'ring evening breeze;
When the song of the nightingale
Wakes music in the wood and vale.
When thinkest thou of me?

I think of thee by the woodland spring,
Where the oaks their shadows fling;
When the day and gloomy night
Mingle in the dark twilight.
Where thinkest thou of me?

I think of thee with smiles and tears;
With trembling hopes and anxious fears;
With longings for thy presence near—
Thy voice to bless, thy smile to cheer.
How thinkest thou of me?

O think of me until we meet,
Beyond the bier and winding-sheet;
Until our hearts in the world above,
Are *one* forever in joy and love!
Thus only think I of thee!

[*From the German.*

The Story-Teller.

A MAN WHO LOST HIS NAME.

I.

ON the second day of June, 186—, a young Norseman, Halfdan Bjerk by name, landed on the pier at Castle Garden. He passed through the straight and narrow gate where he was asked his name, birthplace, and how much money he had—at which he grew very much frightened.

"And your destination?" demanded the gruff-looking functionary at the desk.

"America," said the youth, and touched his hat politely.

"Do you think I have time for joking?" roared the official, with an oath.

The Norseman ran his hand through his hair, smiled his timidly conciliatory smile and tried his best to look brave; but his hand trembled and his heart thumped away at an alarmingly quickened *tempo*.

"Put him down for Nebraska!" cried a stout, red-cheeked individual (inwrapped in the mingled fumes of tobacco and whisky) whose function it was to open and shut the gate.

"There ain't many as go to Nebraska."

"All right, Nebraska."

The gate swung open and the pressure from behind urged the timid traveler on, while an extra push from the gate-keeper sent him flying in the direction of a board fence, where he sat down and tried to realize that now he was in the land of liberty.

Halfdan Bjerk was a tall, slender-limbed youth of very delicate frame; he had a pair of wonderfully candid, unreflecting blue eyes, a smooth, clear, beardless face, and soft, wavy light hair, which was pushed back from his forehead without parting. His mouth and chin were well cut, but their lines were, perhaps, rather weak for a man. When in repose, the *ensemble* of his features was exceedingly pleasing, and somehow reminded one of Correggio's St John. He had left his native land because he was an ardent republican and was abstractly convinced that man, generically and individually, lives more happily in a republic than in a monarchy. He had anticipated with keen pleasure the large, freely-breathing life he was to lead in a land where every man was his neighbor's brother, where no senseless traditions kept a jealous watch over obsolete systems and shrines, and no chilling prejudice blighted the spontaneous blossoming of the soul.

Halfdan was an only child. His father, a poor government official, had died during his infancy, and his mother had given music lessons and kept boarders, in order to gain the means to give her son what is called a learned education. In the Latin school Halfdan had enjoyed the reputation of being a bright youth, and at the age of eighteen he had entered the university under the most promising auspices. He could make very fair verses and play all imaginable instruments with equal ease, which made him a favorite in society. Moreover, he possessed that very old-fashioned accomplishment of cutting silhouettes; and what was more, he could draw the most charmingly fantastic arabesques for embroidery patterns, and he even dabbled in portrait and landscape painting. Whatever he turned his hand to, he did well—in fact, astonishingly well for a *dilettante*, and yet not well enough to claim the title of an artist. Nor did it ever occur to him to make such a claim. As one of his fellow students remarked in a fit of jealousy, "Once when Nature had made three geniuses—a poet, a musician and a painter—she took all the remaining odds and ends and shook them together at random and the result was Halfdan Bjerk." This agreeable *melange* of accomplishments, however, proved very attractive to the ladies, who invited the possessor to innumerable afternoon tea-parties, where they drew heavy drafts on his unflagging patience and kept him steadily engaged with patterns and designs for embroidery, leather flowers, and other dainty knick-knacks. And in return for all his exertions they called him "sweet" and "beautiful," and applied to him many other enthusiastic adjectives seldom heard in connection with masculine names. In the university, talents of this order gained but slight recognition; and when Halfdan had for three years been preparing himself in vain for the *examen philosophicum*, he found himself slowly and imperceptibly drifting into the ranks of the so-called *studiosi perpetui*, who preserve a solemn silence at the examination tables, fraternize with every new generation of freshmen, and at last become part of the fixed furniture of their *Alma Mater*. In the largest American colleges, such men are mercilessly dropped or sent to a Divinity School; but the European universities, whose temper the centuries have mellowed, harbor in their spacious Gothic bosoms a tenderer heart for their unfortunate sons. There the professors greet them at the green tables with a good-humored smile of recognition; they are treated with gentle forbearance and are allowed to linger on, until they die or become tutors in the families of remote clergymen, where they invariably fall in love with the handsomest daughter and thus lounge into a modest prosperity.

If this had been the fate of our friend Bjerk, we should have dismissed him here with a confident "*vale*" on his life's pilgrimage. But, unfortunately, Bjerk was inclined to hold the government in some way responsible for his own poor success as a student; and this, in connection with an æsthetic enthusiasm for ancient Greece, gradually convinced him that the republic was the only form of government under which men of his tastes and temperament were apt to flourish. It was, like everything that pertained to him, a cheerful, genial conviction, without the slightest tinge of bitterness. The old institutions were obsolete—rotten to the core, he said, and needed a radical renovation. He could sit for hours of an evening in the Students' Union and discourse over a glass of mild toddy on the benefits of universal suffrage and trial by jury, while the picturesqueness of his language, his genial sarcasms, or occasional witty allusions, would call forth uproarious applause from throngs of admiring freshmen. These were the sunny days in Halfdan's career, days long to be remembered. They came to an abrupt end when old Mrs. Bjerk died, leaving nothing behind her but her furniture and some trifling debts. The son, who was not an eminently practical man, underwent long hours of misery in trying to settle up her affairs and finally, in a moment of extreme dejection, sold his entire inheritance in a lump to a pawnbroker (reserving for himself a few rings and trinkets) for the modest sum of 250 dollars specie. He then took formal leave of the Students' Union in a brilliant speech, in which he traced the parallelisms between the lives of Pericles and Washington—in his opinion, the two greatest men the world had ever seen—expounded his theory of democratic government and explained the causes of the rapid rise of the American Republic. The next morning he exchanged half of his worldly possessions for a ticket to New York and within a few days set sail for the land of promise, in the far West.

II.

From Castle Garden, Halfdan made his way up through Greenwich street, pursued by a clamorous troop of confidence men and hotel runners.

"*Kommen Sie mit mir. Ich bin auch Deutsch*," cried one. "*Voila, voila. Je parle Français*," shouted another, seizing hold of his valise. "*Jeg er Dansk. Tale Dansk*"—("I am a Dane. I speak Danish")—roared a third with an accent which seriously impeached his truthfulness. In order to escape from these importunate rascals, who were every moment getting bolder, he threw himself into the first street-car which happened to pass; he sat down, gazed out of the windows and soon became so thoroughly absorbed in the animated scenes which moved as in a panorama before his eyes, that he quite forgot where he was going. The conductor called for fares and received an English shilling which, after some ineffectual expostulation, he pocketed but gave no change.

At last, after about an hour's journey, the car stopped, the conductor called out "Central Park," and Halfdan woke up with a start. He dismounted with a timid, deliberate step, stared in dim bewilderment at the long rows of palatial residences and a chill sense of loneliness crept over him. The hopeless strangeness of everything he saw, instead of filling him with rapture, as he had once anticipated, sent a cold shiver to his heart. It is a very large affair, this world of ours—a good deal larger than it appeared to him gazing out upon it from his snug little corner up under the Pole; and it was as unsympathetic as it was large. He suddenly felt what he had never been aware of before—that he was a very small part of it and of very little account after all. He staggered over to a bench at the entrance to the park and sat long watching the fine carriages as they dashed past him; he saw the handsome women in brilliant costumes laughing and chatting gaily; the apathetic policeman promenading in stoic dignity up and down upon the smooth pavements; the jauntily-attired nurses whom, in his Norse innocence, he took for mothers or aunts of the children, wheeling baby-carriages which, to Norse eyes, seemed miracles of dainty ingenuity, under the shady crowns of the elm trees. He did not know how long he had been sitting there when a little bright-eyed girl with light kid gloves, a small blue parasol and a idue polonaise, quite a lady of fashion *en miniature*, stopped in front of him and stared at him in shy wonder. He had always been fond of children, and often rejoiced in their affectionate ways and confidential prattle, and now it suddenly touched him with a warm sense of human fellowship to have this little daintily-berrilled and crisply-starched beauty single him out for notice among the hundreds who reclined in the arbors or sauntered to and fro under the great trees.

"What is your name, my little girl?" he asked, in a tone of friendly interest.

"Clara," answered the child, hesitatingly; then having by another look assured herself of his harmlessness, she added, "How very funny you speak!"

"Yes," he said, stooping down to take her tiny begloved hand. "I do not speak as well as you do, yet; but I shall soon learn."

Clara looked puzzled.

"How old are you?" she asked, raising her parasol and throwing back her head with an air of superiority.

"I am twenty-four years old."

She began to count half aloud on her fingers. "One, two, three, four," but before she reached twenty, she lost her patience.

"Twenty-four!" she exclaimed, "that is a great deal. I am only seven and papa gave me a pony on my birthday. Have you got a pony?"

"No; I have nothing but what is in the valise and you know I could not very well get a pony into it."

Clara glanced curiously at the valise and laughed; then suddenly she grew serious again, put her hand into her pocket and seemed to be searching eagerly for something. Presently she hauled out a small porcelain doll's head, then a red-painted block with letters on it, and at last a penny.

"Do you want them?" she said, reaching him her treasures in both hands. "You may have them all."

Before he had time to answer a shrill, penetrating voice cried out:

"Why, gracious! child, what are you doing?"

And the nurse, who had been deeply absorbed in the New York Ledger, came rushing up, snatched the child away and retreated as hastily as she had come.

Halfdan rose and wandered for hours aimlessly along the intertwining roads and foot-paths. He visited the menageries, admired the statues, took a very light dinner, consisting of coffee, sandwiches and ice, at the Chinese Pavilion and, toward evening, discovered an inviting leafy arbor, where he could withdraw into the privacy of his own thoughts and ponder upon the still unsolved problem of his destiny. The little incident with the child had taken the edge off his unhappiness and turned him into a more conciliatory mood toward himself and the great pitiless world, which seemed to take so little notice of him. And he, who had come here with so warm a heart and so ardent a will to join in the great work of human advancement—to find himself thus harshly ignored and buffeted about, as if he were a hostile intruder! Before him lay the huge unknown city where human life pulsated with large, full heart-throbs, where a breathless, weird intensity, a cold, fierce passion, seemed to be hurrying everything onward in a maddening whirl—where a gentle, warm-blooded enthusiast like himself had no place and could expect naught but a speedy destruction. A strange, unconquerable dread took possession of him, as if he had been caught in a swift, strong whirlpool, from which he vainly struggled to escape. He crouched down among the foliage and shuddered. He could not return to the city. No, no; he never would return. He would remain here hidden and unseen until morning and then he would seek a vessel bound for his dear native land, where the great mountains loomed up in serene majesty toward the blue sky, where the pine forests whispered their dreamily sympathetic legends, in the long summer twilights, where human existence flowed on in calm beauty with the modest aims, small virtues and small vices which were the happiness of modest, idyllic souls. He even saw himself in spirit recounting to his astonished countrymen the wonderful things he had seen and heard during his foreign pilgrimage, and smiled to himself as he imagined their wonder when he should tell them about the beautiful little girl who had been the first and the only one to offer him a friendly greeting in the strange land. During these reflections he fell asleep and slept soundly for two or three hours. Once, he seemed to hear footsteps and whispers among the trees and made an effort to rouse himself, but weariness again overmastered him and he slept on. At last, he felt himself seized violently by the shoulders, and a gruff voice shouted in his ear:

"Get up, you sleepy dog!"

He rubbed his eyes and, by the dim light of the moon, saw a Herculean policeman lifting a stout stick over his head. His former terror came upon him with increased violence and his heart stood for a moment still, then again, hammered away as if it would burst his sides.

"Come along!" roared the policeman, shaking him vehemently by the collar of his coat.

In his bewilderment he quite forgot where he was and, in hurried Norse sentences, assured his persecutor that he was a harmless, honest traveler, and implored him to release him. But the official Hercules was inexorable.

"My valise, my valise!" cried Halfdan. "Pray let me get my valise."

They returned to the place where he had slept, but the valise was nowhere to be found. Then, with dumb despair, he resigned himself to his fate and, after a brief ride on a street-car, found himself standing in a large, low-ceiled room; he covered his face with his hands and burst into tears.

"The grand—the happy republic," he murmured, "spontaneous blossoming of the soul. Alas! I have rooted up my life. I fear it will never blossom."

All the high-flown adjectives he had employed in his parting speech in the Student's Union, when he paid his enthusiastic tribute to the Grand Republic, now kept recurring to him and in this moment the paradox seemed cruel. The Grand Republic—what did it care for such as he? A pair of brawny arms fit to wield the pick-axe and to steer the plow, it received with an eager welcome; for a child-like, loving heart and a generously fantastic brain, it had but the stern greeting of the law.

III.

The next morning, Halfdan was released from the police station, having first been fined five dollars for vagrancy. All his money, with the exception of a few pounds which he had exchanged in Liverpool, he had lost with his valise, and he had to his knowledge not a single acquaintance in the city or on the whole continent. In order to increase his capital he bought some fifty Tribunes; but, as it was already late in the day, he hardly succeeded in selling a single copy. The next morning, he once more stationed himself on the corner of Murray street and Broadway, hoping in his innocence to dispose of the papers he had still on hand from the previous day, and actually did find a few customers among the people who were jumping in and out of the omnibuses that passed up and down the great thoroughfare. To his surprise, however, one of these gentlemen returned to him with a very wrathful countenance, shook his fist at him and vociferated with excited gestures something which to Halfdan's ears had a very unintelligible sound. He made a vain effort to defend himself; the situation appeared so utterly incomprehensible to him and, in his dumb helplessness, he looked pitiful enough to move the heart of a stone. No English phrase suggested itself to him, only a few Norse interjections rose to his lips. The man's anger suddenly abated; he picked up the paper which he had thrown on the sidewalk and stood for a while regarding Halfdan curiously.

"Are you a Norwegian?" he asked.

"Yes, I came from Norway yesterday."

"What's your name?"

"Halfdan Bjerk."

"Halfdan Bjerk! My stars! Who would have thought of meeting you here! You do not recognize me, I suppose?"

Halfdan declared with a timid tremor in his voice that he could not at the moment recall his features.

"No; I imagine I must have changed a good deal since you saw me," said the man, suddenly dropping into Norwegian. "I am Gustav Olson. I used to live in the same house with you once, but that is long ago now."

Gustav Olson—to be sure, he was the porter's son in the house, where his mother had once during his childhood, taken a flat. He well remembered having clandestinely traded jack-knives and buttons with him, in spite of the frequent warnings he had received to have nothing to do with him; for Gustav, with his broad freckled face and red hair, was looked upon by the genteel inhabitants of the upper flats as rather a disreputable character. He had once whipped the son of a colonel who had been impudent to him, and thrown a snowball at the head of a new-fledged lieutenant, which offenses he had only expiated at a house of correction. Since that time he had vanished from Halfdan's horizon. He had still the same broad freckled face, now covered with a lusty growth of coarse red beard, the same rebellious head of hair, which refused to yield to the subduing influences of the comb, the same plebeian hands and feet and uncouth clumsiness of form. But his linen was irreproachable, and a certain dash in his manner and the loud fashionableness of his attire gave unmistakable evidences of prosperity.

"Come, Bjerk," said he, in a tone of good-fellowship which was not without its sting to the idealistic republican, "you must take up a better business than selling yesterday's Tribune. That won't pay here, you know. Come along to our office and I will see if something can't be done for you."

"But I should be sorry to give you trouble," stammered Halfdan, whose native pride, even in his present wretchedness, protested against accepting a favor from one whom he had been wont to regard as his inferior.

"Nonsense, my boy. Hurry up; I haven't much time to spare. The office is only two blocks from here. You don't look as if you could afford to throw away a friendly offer."

The last words suddenly roused Halfdan from his apathy, for he felt that they were true. A drowning man cannot afford to make nice distinctions—cannot afford to ask whether the helping hand that is extended to him be that of an equal or inferior. So he swallowed his humiliation and threaded his way through the bewildering turmoil of Broadway, by the side of his officious friend.

They entered a large, elegantly-furnished office, where clerks with sleek and severely apathetic countenances stood scribbling at their desks.

"You will have to amuse yourself as best you can," said Olson. "Mr. Van Kirk will be here in twenty minutes. I haven't time to entertain you."

A dreary half hour passed. Then the door opened and a tall, handsome man, with a full grayish beard and a commanding presence, entered and took his seat at a desk in a smaller adjoining office. He opened, with great dispatch, a pile of letters which lay on the desk before him, called out in a sharp, ringing tone for a clerk, who promptly appeared, handed him half a dozen letters, accompanying each with a brief direction, took some clean paper from a drawer and fell to writing. There was something brisk, determined and business-like in his manner, which made it seem very hopeless to Halfdan to appear before him as a petitioner. Presently Olson entered the private office, closing the door behind him, and a few minutes later reappeared and summoned Halfdan into the chief's presence.

"You are a Norwegian, I hear," said the merchant, looking around over his shoulder at the

supplicant, with a preoccupied air. "You want work. What can you do?"

What can you do? A fatal question. But here was clearly no opportunity for mental debate. So, summoning all his courage, but feeling nevertheless very faint, he answered:

"I have passed both *examen artium* and *philosophicum*," and got my *laud* clear in the former, but in the latter *haud* on the first point."

Mr. Van Kirk wheeled round on his chair and faced the speaker. "That is all Greek to me," he said, in a severe tone. "Can you keep accounts?"

"No. I am afraid not."

Keeping accounts was not deemed a classical accomplishment in Norway. It was only "tradesmen" who troubled themselves about such gross things and if our Norseman had not been too absorbed with the problem of his destiny, he would have been justly indignant at having such a question put to him.

"Then you don't know book-keeping?"

"I think not, I never tried it."

"Then you may be sure you don't know it. But you must certainly have tried your hand at something. Is there nothing you can think of which might help you to get a living?"

"I can play the piano—and—and the violin."

"Very well, then. You may come this afternoon to my house. Mr. Olson will tell you the address. I will give you a note to Mrs. Van Kirk. Perhaps she will engage you as a music teacher for the children. Good morning."—[To be continued.

"Examen artium is the entrance examination to the Norwegian University, and *philosophicum* the first degree. The ranks given at these are *Laudabilis præ ceteris* (in student's parlance, *præ*), *laudabilis* or *laud*, *haud illaudabilis*, or *haud*, etc.

AMERICAN AND ENGLISH TIME-SERVERS.

The great difficulty in this country is that we have no time for anything. The very walk of an American shows that he is in a hurry. An Englishman buttons his coat and gloves and goes to business as deliberately as he goes to church. An American business man flies after the car, struggling with his coat sleeves as he runs, plunges in head foremost and plunges out at the end without regard to his neck. Chief among our accidents stand those which occur because people will jump upon flying trains or after departing boats. To wait ten minutes is something not to be thought of. Dinner is not eaten—it is swallowed whole; and when one comes to the dessert he finds that the fruit was picked before it was ripe.

Everything is hurried through, from the building of a house to the curing of hams. The women who work on sewing-machines stop before they come to the end of the seam. The dressmaker sends home your dress with basting threads in it and no loops to hang it up by.

There is none of the slow, sure completeness of the old world about anything, and fortunes are made in a hurry and lost in the same way. If any man we know is getting rich by the slow and patient process of saving, be sure that he was not born upon this continent. Yet people live as long here as they do anywhere else, and the days are the same length. Why is it we have no time for anything?

DICKENS' MANNERS.

When Charles Dickens was in this country some years ago, he went to Albany to lecture and put up at Congress Hall. General Woodford was then Lieutenant-Governor and had an elegant suite of rooms there and, as he was absent with his family, he kindly gave permission to place his rooms at the disposal of the great novelist. He accepted the courtesy as a mere matter of course and had not the grace to express any thanks. He lectured, pocketed the money, and went away like any other showman. A few months afterwards he returned to lecture again and was shown to other apartments, with which he was not pleased. He sent for the landlord and demanded his former rooms. Mr. Blake said that they belonged to the Lieutenant-Governor of the State. That did not matter, said Dickens, "go and ask him if he will give up his room to me." Blake demurred to this, but Dickens insisted. With a very long face, at last Blake went to General Woodford's room and put the question. Woodford looked quietly for a moment at Blake and then said:—"Two months ago, in my absence, I gave up my rooms to Mr. Dickens as a personal accommodation to yourself and him. Mr. Dickens had not the grace to express any thanks. Perhaps these are English manners. They are not good manners, anyhow. Say to Mr. Dickens that the Lieutenant-Governor of the State of New York is not in the habit of turning himself out of his home for the accommodation of traveling showmen."

The Literary World.

RECENT LITERATURE.

First Steps in English Literature. By Arthur Gilman, A. M. New York: A. S. Barnes & Co.

It is pleasant to see how nicely the ways of knowledge are being smoothed for the youth of this century. Finally, the day has passed when matured talent can look back, with self-complacent glance and murmur to himself, "Ah! how cleverly my biographer, if he should be a man of function, can work up that rush-light episode of my struggling existence," etc. Our boys can no longer say that their advantages are not ample. Indeed, the text-books now issuing are written so cleverly—combine, skeletonize and arrange facts, incidents and principles so entertainingly and lucidly, that the marvel would be that our young people should not find pleasure in study.

The idea of "outlines" of subjects is not new, an English society for the promotion of knowledge having printed many little volumes of this character. The scheme may not be said to have been fairly launched, however, until the appearance of Messrs. Ince & Gilbert's "Outlines," which had and have, we believe, an amazing popularity in England. As an elementary step, nothing could be better than the system under discussion, which is so brilliantly sustained by the author of the book under notice.

The world moves, history is being made at a tremendous rate and important facts and principles grow apace. It is necessary that the student should have a general knowledge of the salient features of the past, in order to intelligently digest the facts of the present. If this need was not met by a skillful outline of subjects, the mass of literature that would have to be attacked might well snuff out the curiosity of the most ardent student. A person that pretends to the least culture must have a more or less accurate idea of the history of the world, in its various branches. The class of text-books under discussion enable him to attain his end with the least waste of time, and additionally aid him to pursue in detail the special subject his curiosity inclines him to. It is by following the bent of one's curiosity that real and lasting progress is made.

Mr. Gilman's "English Literature" is a book that can be read with profit by children of a larger growth. The author has adopted an admirable plan. His divisions of his subjects are clear and easily retained. The matter is suggestive and should stimulate the least active mind to continue the subject where the author leaves off. Our literature is, to a great extent, colored by our history, and the author uses this knowledge most happily by giving a brief sketch of the political and social state of the country during the era whose literature is under discussion. He avoids biographical details, and shuns the "elegant extracts" part of the work with commendable judgment. The book contains charts that are a great help to the student, and finally, lends material aid to the student by furnishing at the end of the book a carefully selected list of the best authors, and where their works can be obtained. His style is limpid, terse and excellently adapted to the work he sets himself to do. We have space to spare for a few extracts only. Speaking of the Italian influence in his introductory to Mature English, he says:

"The period before us is often called the Age of Elizabeth and the Golden Age, either of which terms is appropriate. It includes, however, not only the reign of England's greatest queen, but also those of her successors, James I. (who died in 1625) and Charles I. (who was beheaded in 1649). The first half of Elizabeth's reign is not marked by the production of works that should give the period the high distinction it has received.

"At the beginning of the era just concluded there has been a notable increase of literary life, but the activity did not continue throughout the period. The fifty years before the accession of Elizabeth were crowded with exciting changes.

"Henry VIII. began to reign in 1509, at the age of eighteen. He was a monarch of caprices, which were exhibited in other relations as well as in his dealings with his wives. At the time of his accession, Thomas Wolsey was Dean of Lincoln, having previously been one of the chaplains of Henry VII., and to him, for various reasons, the young king looked for advice. Wolsey cultivated his esteem and obtained many preferments, but differing with him on the subject of Queen Catherine's divorce, Henry charged his favorite with high treason. Wolsey was disgraced and would have been executed, had he not died at Leicester Abbey, to which place he had fled for refuge. Sir Thomas More took Wolsey's place, but was subsequently beheaded, a martyr to the royal caprice. Thomas Cranmer, the third favorite, outlived his royal master, but it was only to perish at the hands of his daughter Mary.

"Among the other events were Henry's defiance of the Pope of Rome, his wars with France, the demolition of the monasteries and convents, terrible persecutions of papists, hangings, burnings and beheadings, and such violations of the liberties guaranteed by the Magna Charta as no English sovereign was ever before guilty of. The people were in terror.

"The short reign of Edward VI. was a season of comparative quiet; but when his sister Mary came to the throne there was a great change. Inaugurating her accession by the execution of Lady Jane Grey, she made herself increasingly odious by endeavoring to force Roman Catholicism upon the nation. During the five years of her reign near three hundred so-called heretics perished at the stake.

"Notwithstanding the delirium of joy with which Elizabeth's accession—or rather the death of Mary—was received, the early years of her reign were by no means undisturbed. The painful circumstances connected with the imprisonment of Mary Stuart, ending with her execution in 1587, the executions caused by the enforcement of the act of Supremacy, and the loss of their livings suffered by many clergymen of the Church of England who could not in conscience submit to the Act of Uniformity,—these exciting affairs so engrossed public attention that small interest was manifested in letters.

"By degrees, however, quiet was restored and men began to breathe more freely. There was universal progress, new knowledge was eagerly received, and literary topics assumed greater importance.

"Nor was this activity apparent only in England. In his Polish observatory Copernicus had already concluded the observations which led to the publication in 1543 of his great work, "On the Revolution of the Heavenly Bodies." Cortez had just before conquered the rich kingdom of Mexico for his sovereign, Charles V., and it was the era of the formation of the Dutch Republic, as well as of the revolt of the Moors in Spain. It was the period of the Spanish Armada, of the voyages of Sir Francis Drake, of the increase of England's naval power, of the introduction of tobacco and of potatoes, of the great reformation of Luther in Germany, of the Council of Trent, and of the revival of arts, sciences and literature throughout Europe.

"New worlds, new people, new wealth, everything appeared new or in a new phase, and there arose that galaxy of lights in the literary firmament which pale the rays, as well of those who went before, as of all who have since risen.

"Another influence contributed also to mark the line between immaturity and maturity, than which no other was more potent. This was the printer's press, which had been introduced in the fifteenth century and was now showing its fruits in a more fixed language. Before this time every writer wrote and spelled too much as he pleased, without rule, and not even observing uniformity in different parts of the same work. Now, when one man published many books, the need of uniformity was more apparent, and since he circulated many copies, his example became a guide to others, and the form as well as the style of our language grew more fixed."

This extract gives a fair idea of the manner in which the historical groundwork of the scheme is worked out. At the conclusion of each epoch he sums up tersely its fruits, as in this example of the close of the era of Immature English.

"We saw Cranmer perish at the stake, but it was not until he had given England her Prayer Book and her Church Polity. And now Nicholas Udall crowds himself upon our view, and with mock gravity lays before us "Ralph Royster Doyster," and we recognize the first English comedy. The patriarch advancing now is Roger Ascham, holding in his still shewy grasp the first treatise on education, and his argument for manly sports.

"Before the curtain drops we find ourselves walking down the High Street of Edinburgh. Just as we pass the Heart of Midlothian we encounter a crowd and, looking upward, see a venerable form at a little pulpit-like window that juts over the pavement. The appearance of the crowd and the words we now and then catch, tell us the old man is preaching. Listening again we hear the Monstrous Regiment of Women denounced, and then we remember that it was John Knox who first gave Presbyterianism to Scotland!"

The fact that this little book is in its tenth edition, is significant of its influence, and we can freely add that we should like to know it was in the hands of many who would be benefited by it quite as much as the schoolboy.

The Mask of Comus. By John Milton. New York: J. W. Schermerhorn & Co. (Pamphlet.)

To those who are at all familiar with English classics, it is of course unnecessary to say anything of this, one of the most beautiful productions of the genius which gave to the world "Paradise Lost." It would be well in this case, however, to note the excellent arrangement of Prof. Sprague in his annotations and exercises in synonyms for the use of classes in reading, analysis and parsing. And we cannot lay the little book aside without remarking also the excellent manner in which its publishers have issued the work—its heavy, strong paper, neat typography and special adaptability to the uses for which it is intended.

Water Lilies. (Small quarto—208 pages.) New York: National Temperance Society; J. N. Stearns, Publishing Agent.

This is the prettiest book for children we have seen for a long time, and it is good as well as pretty. It contains about one hundred full-page engravings and smaller ones in abundance, all of which are well executed. The reading matter is excellent, and the lessons it conveys cannot fail to be of service to any child that reads it, throughout its whole life. The binding is worthy of special notice, being in itself a work of art. In selecting holiday presents for the little ones, ask for this book at your bookstore or order it direct from the publisher, as above.

NEW MUSIC.

From F. W. Helmick, Cincinnati, O.:

Prodigal Son, by C. Wallace Dawson. It is to be hoped that Mr. Dawson knew what he intended by this composition, as it is doubtful if anyone else ever will.

From W. A. Pond & Co., New York:

Hip! Hip! Hurrah! ! or, On the Road to Pelham; by Schoenbrun. A very lively, rattling song, with chorus for four voices. It illustrates Col. Kane's Pelham coach rides. Society Waltz, by Geo. H. Stout, Jr. A very pretty little waltz and not at all difficult. Just the thing for dancing in the home circle. Hayes & Wheeler March, by Carl Straudberg. An easy, showy piece, with plenty of noise and some harmony. Tilden & Hendricks March, by Wm. P. Adams. Quite pleasant in harmony and easy to execute. Hayes the true and Wheeler too—an adaptation of the popular old campaign song of Tippecanoe & Tyler Too. Rose Bell, My Darling, by T. H. Hinton. Simple little song with chorus, which is sure to be popular.

George Eliot's last, "Daniel Deronda," seems to be suffering at the hands of the critics.

Sabbath Reading.

SUBMISSION.

What use to struggle, Friend?
Your sigh but serves to swell the tempest's roar,
And does not haste the end.
Lie still and wait, for you can do no more.

Man's will subdueth much:
God's will subdueth *all* through time and space,
Your power is not a touch
When used to turn His rod—or force His grace.

Would it avail the seed,
If it should weary of its darksome bed,
And cry aloud its need
Of sunshine, and of liberty instead?

And where would be the flower
If God should heed the seed's impatient cry,
And in that bitter hour,
Open its prison-hole to light and sky?

I tell you, Friend, that we
(I say it, though the chain drags hard to-night)
Are better bound than free—
Who wait in shade, that we may live in light.

[*R. W. Easterbrooks.*

GEORGE SMITH AND HIS GENIUS.

Mr. George Smith, the young and surprising Assyrian scholar, whose brilliant genius first flashed out upon the world at large in the publication of his Assyrian account of the Deluge, has fallen in the field of his labors and triumphs. The mysterious letter on a Babylon brick seemed the natural channel of thought to his mind. The abstruse and unsolved secrets of that curious alphabet became plain before him. Other men labored for years to evoke a few rays of dim intelligence from an inscription which he seemed to penetrate without effort. The hoary mysteries buried in the ruins of Assyrian palaces, which troubled the mind of Herodotus and of all curious explorers since, became luminous under his glance. He brought out revelation which the world supposed did not exist—dumb but unshakable witnesses to the truth of things which, it had been presumed, must forever rest upon simple faith for their credence—stories of the creation, of the Apostacy in Eden, of the building of the Tower of Babel, of the Deluge; written long centuries before Moses was born, and perhaps when Abraham was still a child at Ur of the Chaldees. These things had been read for ages in the Bible, but the world had long ago given up all expectation of ever finding anything more direct in confirmation of them than the vague allusions and incidental hints of precarious tradition. Believing minds felt that they bore the impress of truth, and the corroborative facts were multitudinous and convincing, from their mass; but there was painfully little in the way of succinct and circumstantial statement. But Mr. Smith saw the tens of thousands of fragments of clay—tablets, cylinders, sealed sculpture—all written over with the wedge-shaped characters, many so minutely engraved as to require the use of a magnifying glass; he looked into them and, by an instinct peculiarly his own, began to draw out their buried secrets.

He was a poor and slenderly educated boy, whom the strain of narrow circumstances had taken from school at fifteen, to be apprenticed to an engraver. Not far from the place was the great Museum in which England takes such honorable pride. He went there at noon, pinching off half hours after hastily eating his dinner, as the institution was closed at sundown. Rummaging among Assyrian tablets and Babylon bricks, he seemed to have discovered his natural home, the true field of his genius. His quick sight and earnest inquisitiveness drew the attention of Sir Henry Rawlinson and, with a little help, he soon knew more of the language than those who had studied it longest. His marvelous insight pierced through the complications of the involved alphabet; he would penetrate the meaning of an obscure passage or complete the lost part of a mutilated inscription with a readiness that was like inspiration and with the certainty of a native dealing with his own language, perfectly convincing in its correctness, even where he could not clearly explain his interpretation according to grammatical rule.

Next in mysteriousness to the endowment of this remarkable man, is the decree of Providence which ordered his death. At the age of thirty-seven, although he has done so much, his work is scarcely more than begun. A vast literature still remains locked up in these crumbling earthen tablets, secrets that have been hid from ages and generations. His accurate eye never made a mistake in discerning a letter or copying it out; his wonderful memory could identify and match together unerringly any of those myriad broken shreds. When will a man arise who can take up his work and complete it?—*H. U. Swinnerton, in N. Y. Observer.*

In the use of the tongue God hath distinguished us from beasts, and by the well or ill using of it we are distinguished from one another; and therefore, though silence be innocent as death, harmless as a rose's breath to a distant passenger, yet it is rather the state of death than life.—*Jeremy Taylor.*

Better it is, toward the right conduct of life, to consider what will be the end of a thing than what is the beginning of it—for what promises fair at first may prove ill, and what seems at first a disadvantage may prove very advantageous.—*Wells.*

If anger is not restrained, it is frequently more hurtful to us than the injury that provoked it.—*Seneca.*

Ladies' Portfolio.

THE MINER'S STORY.

I MARRIED Barb'ry out'n the city, you see,
She was far too nice a lass for the like o' me,
I did my courtin' in brave, fine clothes, my best;
I didn't tell her 'at I was a miner-lad, like the rest.

Not that]she thought me a gentleman's son, of course,
I'd never go there, riding, with gig or horse,
But I somehow kept under my workin' ways and talk,
And I'd never notice the common lads in my walk.

P'r'aps I let on that I had a farm at the least,
For I could talk knowin' 'bout any barn-yard beast,
And bees, an' the like, an' crops of barley an' rye,
And of seeds an' roots, 's if I had come there to buy.

She was a delicate, purty, lady-like little thing,
With a cheek like the blush on a rose; there's a shinin' ring
Of her yellow hair, in my Bible; I keep it so,
'Cause it kinder draws me to read the good Book, you know.

So I married Barbary—she went home wi' me the same day;
I took her to my old mother, an' what'd the good soul say?
"She's not fit for you, son, a rough miner wants strength in a wife;"
I thought I sh'd sink in the ground—'twas the sin o' my life.

I didn't dare to look in the poor little quiverin' face;
"It's the deceiving I mind, dear, 'tisn't the work, or the place;"
Them's just her words, and I wanted to die in my shame;
"You got me with lying;" her look meant exactly that same.

So I did; and it made me ugly as time went along;
For I fancied that Barbara always remembered the wrong,
So't if sho was pale, I'd tease her 'most out of her life,
And tell her sho ought to be stronger, being a miner's wife.

And once when my temper was up, I cursed her to her face;
She fell at my feet, so white and scared! 'twas a burnin' disgrace;
And then came the awfullest hour a man can ever see,
And a little morsel of new-born life, laid on my knee.

Well, p'r'aps one like me'll never see the angels or such,
If the Lord kept *her* from me *I* shouldn't blame Him, much.
I wasn't fit settin' for a di'mond, precious as that,—
You're lookin', I see, at the piece o' crape on my hat.

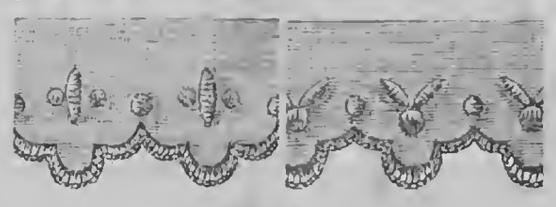
Lost both, sir; it's all right, I'm not the man to complain.
They're where the glory and beauty is; I'm left alone with the pain;
But I'm fightin' my cursed temper, fightin' both day and night,
And I'll conquer it, if I die—it's all right, sir; all right.

[*Mary A. Denison.*

MARY'S ELDERBERRY PIE.

I HAD just returned home, having been absent several months teaching "young ideas how to shoot," or at least trying to train young minds to follow after wisdom and knowledge that should benefit them in all future time. As a matter of course, some of my friends had come with me to have a sort of family visit at the old homestead. Mother had parlor and sitting-room and all the other rooms arranged in "apple-pie" order,—I believe that is an Eastern phrase for pleasant, cheerful good taste in the general arrangement of furniture and ornaments,—though why it should be apple pie more than any other is quite beyond my dull comprehension. We all visited as fast as possible, frequently all talking together in our anxiety to give and gain information.

The morning after my arrival, finding myself quite rested and refreshed from my long journey over a new country, I began to render assistance about the morning work. As the dinner hour approached, it was a subject or thought and discussion between mother and myself what we should have for dessert, that would be a little treat to our guests. At last we decided on having an elderberry pie, as that was, as yet, something quite out of the common fashion.



LACE DESIGNS.

Now *teachers* are proverbially called "lazy," and are not supposed to know much about work outside of the school-room. I would let my friends know there was at least one who could cook as well as teach.

The fall previous I had gathered a few fine, pulpy berries; and thinking to save hollow teeth from the annoyance of the seeds, I had squeezed out the juice and canned it the same as other fruit. A teacupful of this juice, a coffee-cup of sugar, two spoonfuls of flour, a bit of butter and a few pieces of fresh lemon, were the ingredients used for the inside of the pie; a rich paste made upper and under crust. It came out of the oven flaky and odorous. And I said to myself, "There's a pie fit for the President."

Mother's pleasant invitation to our guests and the family was given, and we all gathered about the well-filled table. Now, my "big brother" has a way of eating exceedingly fast, and ere I had done more than to sip my tea and eat a few mouthfuls, he had taken up his pie plate. He is our *pie barometer*, and I always take note of his face when he tastes a new variety. If he takes kindly to it without remark—he seldom praises—I conclude at once it is *good*.

On this occasion I saw his big blue eyes dilate, then a portentous scowl overspread his face, and a very perceptible shudder passed through his stalwart frame. His plate and fork were pushed away with the exclamation, "MATE, what in the world have you put in that pie?"

"Why, what ails it?" said I, and immediately took a bit of it into my mouth. Bitter, *bitterer*, BITTEREST.

RUSTIC CROSS.

Quickly as possible I gathered up the pie dishes from before our guests. But Mr. E. managed to have a taste, in spite of my efforts to the contrary. Thanks to mother's well-filled pantry, there was no necessity of going without our dessert.

But my pie!—the dog refused to taste it; the hens eyed it with disdain; the pigs were disgusted with the unsavory morsel, and it was tossed about the farm till Mother Nature became tired of the sight and resolved it into its elements.

But if at any time I declare my ability to cook well, they have only to mention elderberry pie, and I submit at once. Can any of the RURAL readers tell me *why* the pie was bitter?

Pleasanton, Mich. M. E. A.

WIDOWS.

WINTER-KEPT apples, seasoned wine, a clouded meerschaum, a vase around which the scent of the roses still hangs, all these have a rare, ripe, evanescent flavor that suggest, but cannot express, the charm of the widow. A young widow is, perhaps, the most interesting object in nature—or in art. She represents experience without its wrinkles or its gray hairs. She has matronly beauty and maidenly freedom combined. She is grief with a laughing eye—sorrow in a house of festival—a silver moon in a sable cloud. She is too sweet for anything! Like all good things, she can only be created at a great sacrifice. Mrs. Browning says that a man must be pretty thoroughly spoiled before he can leave a widow. This black swan—this mournful Phœnix—rises only out of the funeral urn that holds the ashes of a husband's heart.

Let us wipe away the briny tear and proceed. *Perdite Pierides.* Poets, statesmen, heroes and philosophers have each felt the indelinable influence of widowhood. Its quality is not sustained. It falls alike upon the just and unjust. Edward Plantagenet married the widow Elizabeth Gray, though he knew she brought civil war for her dowry. Ned Walker, Joe Addison, Sam Johnson, George Washington, Napoleon Bonaparte, John Wesley, Tony Weller, Ben. Disraeli and all the boys married widows. Henry VIII. was so fond of them that he took two, and King David was so pleased with Abigail, the widow of Nabal, whom he took to wife, that he turned Bathsheba into a widow on purpose to marry her. When Judith ceased her cogitations over the virtues of the late lamented Manasses of Bethulia, puts off her mourning and adorns herself in brave attire to set out for the camp of Holofernes, we feel instinctively that she will come back with his heart, his crown or head, whichever she goes for. When the old widow Naomi counsels the young widow Ruth how to lay her snares in the harvest fields of her kinsman, and spring her net on the threshing floor, we know at once that the wealthy Bachelor Boaz might as well order the wedding garments. Allan Ramsay wrote a song telling how to woo a widow. He might as well have left directions how to get struck with lightning.

A ROMANTIC STORY.

IN the middle of the winter of 1838 a fire broke out in the female seminary at Limoges, France, and spread with such rapidity that it was feared all the inmates would perish. Suddenly there came a cry that one little girl had been left in her room. As the excited spectators were beginning to pray for the unfortunate child, a tall girl, with dishevelled blonde hair and flowing night-gown, ran through the crowd, and, with a shriek, "I'll save her!" that rose above the sound of cracking timbers and falling masonry, dashed into the doorway. A loud hurrah, that was prolonged to the echo only to be repeated again, attracted the attention of the dovolees, and the pale-faced girl was seen hurrying through the flames with the terrified child. A few days thereafter King Louis Phillippe sent the heroine a gold medal for her bravery, and a captain in the French army, who had witnessed the girl's pluck, begged an introduction. The captain is now President of France and the brave girl Madame Mac Mahon.

IT was George Herbert who said a handful of good life is worth a bushel of learning.

Reading for the Young.

THE OLD HOSTLER'S EXPERIENCE.

I GITS up heah—like good ol' Paul,
Obed'ent to de Mahs'r's call—
To tell my 'sperunce, tell it all!
Ol' SHAME's put up;
An' I's led GLORY out de stall,
To win de cup.

Den, all you sinnahs, c'ar de track!
I's mounted on ol' GLORY's back;
Her hufs is gwine ta-click-ta-clack,
Dat's how dey's gwine!
An' Satan's rattlin', shacklin' back
Is lef' behin'.

Ah, Christuns; in my foolish days,
I rid de debbil's blooded bays;
PERSUMPTUOUS PRIDE, an' WORL'LY WAYS,
An' made 'em lope;
But now I's turned 'em out to graze
Widout a rope.

Yah! Yah! *Oh!* how I used to——. Well,
De 'ticlars 'taint no use to tell,
But oncet I rid de road to hell
Wid nar a bit,
An' went two-forty on the shell
Toward de pit.

Like Balaam, when he rid de ass,
I 'sisted on a-trablin' fas'—
But 'twas a pace 'at c'u'dn't las',
An' I got th'owed.
I cotch RELIGION, trottin' pas',
An' back I goed.

An' now I simply 'vises you—
You deblish boys I's talkin' to—
Don't nebber hab a thing to do
Wid Satan's hosses;
Dey'll buck 'un fling you in de sloo,
Fus' one you crosses.

But git RELIGION well in han',
An' ride her like a little man—
Dere ain't no hoss in all de lan'
Kin run agin her—
An' you'll come by de jedges' stan'
A easy winner. [*Irwin Russell.*

FROM THE CENTENNIAL EXHIBITION.

PHILADELPHIA, NOV. 2, 1876.

WHAT a rush! Everybody seems determined to improve these last days. Main Building, Art Gallery and the places of greatest interest are so crowded that one can scarcely move about. Steam and street cars are loaded until there isn't even a hanging-on place, and men are crowded off the platforms and get their necks broken. What a place for elegant attire; and how nice to have your pin-back so tight and your ruffles and furbelows so profuse, that when you make a leap for a street car you miss and are in danger of being crushed beneath the wheels! Horses drop down in the streets and die of overwork. Only one span attached to cars carrying more than a hundred people. BERGH is needed here if he ever was needed anywhere. Still Philadelphians say they are doing the best they can, but if the influence of the almighty dollar had not such a hold upon humanity they *might* do better. Money, money seems to be the great object of the Exhibition, as it is of every Yankee invention.

How it detracts from the æsthetical influence of a beautiful picture or statue to have placarded upon it, "For sale; price $150,000." If you have a thousand dollars to spend, you might buy a small keepsake to take home with you; and if a hundred thousand, you might possibly buy a picture or piece of furniture. It does seem as though, in this great anniversary, patriotism, at least in the hearts of Americans, *might* keep the money-mania a little in the background.

With all the crowding, pushing and jostling, everybody looks smiling and good-natured until about four or five o'clock in the afternoon,—and then what weary, woe-begone faces one meets! Some of them belong to women who are carrying crying babies in their arms. What a place for babies! No wonder they lament in a loud voice. Said a woman who was standing in a street car last night, pushed and jammed about with a tired-out child in her arms; "I don't think I shall take him again; the poor little dear gets *so* tired, and it's such hard work to carry him about, and he doesn't seem to appreciate the show one bit." What a good resolve; may all her sister-mothers do likewise! In the crowd and bustle, woman's right to seats is done away with. They *stand* on an equality with the men.

Philadelphians and exhibitors say they are worn out with being questioned and talked to, and will be glad when the thing is ended; yet they say the Exhibition—at least the greater part of it—will be kept open until next month.

GERALDINE GERMANE.

LETTERS FROM BOYS AND GIRLS.

Another Protest.

DEAR RURAL COUSINS:—As the Editor was kind enough to print the letter I wrote about a year ago, I may as well try again. We girls are very loath to believe the boys can write better essays than we, without first seeing proof of it. As far back as my memory serves me, I have heard boys, and men also, assert that they could have done better if they had tried. I think it would be better to *try*, and not say so much about it. Now I don't know but this sounds as if I were a little strong-minded—as the world uses the phrase—and disliked boys in general. That is not so; I dislike the conceited ones only. I don't want my gentlemen Cousins to think that I believe conceit or vanity to be confined to them alone, for I know it grows rank among us, and I dislike to see it there fully as much. Anything but a vain, conceited boy or girl! Uncle TRUE was very kind to give us such a nice subject and an opportunity to air our knowledge of History, and I hope he will give us another chance soon, and then we will see if the boys can write abler essays than we,—you see I don't hardly believe it, girls. Will not YOUNG NATURALIST please be so kind as to write again, or does he dislike being so notorious among us? I love flowers, and have quite a number which I intend to keep through the winter. I think Fish Geraniums are very showy and nice for window gardens, and I have six nice, thrifty ones, also a splendid Calla, which has bloomed twice this summer, and quite a number of other kinds of plants. I find I have more blossoms if I keep my plants in small pots; but no doubt you are all wanting me to say, Good-by.—YOUNG TEACHER.

P. S.—Thanks to STORM and YOUNG EDITOR, No 2, for making our column so lively.

From a Country Belle.

DEAR YOUNG RURALISTS:—I don't suppose you care very much about hearing from me again, but I am not going to wait to hear whether you do or not. I don't know what to think of YOUNG EDITOR, No. 2, but if that young gentleman will come back, sit down, take time and say what he has to, and not go over it in such a helter-skelter way and then spring up and leave us so abruptly, I will try and tell him what I think of him. I am not very fond of storms as a general thing, but there are some STORMS which I admire; but, my fine young gentleman, don't spoil all of your noble qualities by being conceited. You boys boast that you could beat the girls in writing the history of JOAN of Arc, but you couldn't have had much confidence in yourselves or you certainly would have attempted it. But I wouldn't say anything against STORM for the world! The same description suits us both; of course we must be friends. Besides, you have just my opinion about the Cousins agreeing so well. If all the city Cousins soar to the hights of W. C. of New York, give me the country forever, and aye! Now boys, don't be backward; you can and must hold your own with the girls. Stand up, and let them know what you are made of. (O noble manhood, where are thy charms!) I like YOUNG PRINTER pretty well, but I think JOE STEELE is quite a cheeky little fellow. I would like to get acquainted with Cousin GYPSY BELLE, as I like her very much. Of course I have favorites, but I like nearly all of the Cousins. Well, don't you think I have scribbled about enough? I do; so hoping to hear from you all soon, and with friendly adieu, I will make my exit.—BELLE E. F.

Another for the Boys.

DEAR COUSINS:—I will again try my luck in writing to my RURAL Cousins. I think STORM expresses his likes and dislikes rather freely, seeing he doesn't wish to be one of us. If you boys have such good opinions of yourselves in regard to writing histories, and if, as you say, you can write better ones than the girls, then why don't you? You have just as good a chance as we have. You say, sir, that it makes no difference if one of the boys does get snubbed, for the rest of you will take it up and give the girls as good as they send. I think if you would put *try* in it you would come nearer the truth, for you know you *cannot* return as good as is sent. Another Editor! What shall we do with him? I suppose he will want a front seat, for I see by his letter that he has a very good opinion of himself. "Well, if he didn't have perhaps no one else would." Y. E., you say that you have a "sprightly sheet, which shows its beaming countenance every month. *You* may think it "sprightly;" what is the opinion of those who read it? I would advise you not to say anything that sounds so much like praise of your own work. As the old adage has it, "Self praise goes but a little ways." FLORENCE D. wishes to know how to prepare autumn leaves. I have some that are very pretty. This is my method: After gathering, press them in books until nearly dry; then oil them with sweet oil and press again until dry; then varnish them. In this way they will last all winter. Has H. S. received my letter yet?—ADELE W.

A Friendly Visit.

DEAR FRIENDS:—I do not dare to address you as cousins without your permission, for this is the first time I have written. I quite agree with BELLE E. F. in regard to piecing quilts, for in making dresses there are a great many pieces that would have to be thrown away, if it were not for some such way of using them. I have pieced six and think of commencing another. I would like to tell FLORENCE DELANO that I have two ways of preparing autumn leaves for bouquets. One is to press the leaves in a book until thoroughly dry, and then varnish them; and the other is to dip them in hot wax when yet fresh from the trees, and after they are dry tie them on a wire or small stick. If you press them, you want a heavy weight on the book; if you don't have it, they will curl so that you cannot do anything with them. I guess I will not make a longer stay this time for fear I may find my way into that great big basket over there in the corner, but if I escape it this time I will write again and tell you about my little sisters.—MINNIE HAZELWITCH, *Whitestown.*

From Georgia.

GOOD morning cousins, one and all, if you will receive me as one of your number. I have been reading you letters for some time and with much interest. We have been taking the RURAL for the

past five or six years, and like it very much. Last night I was reading STORM'S letter. I like him; think another letter from BELLE E. F. would be interesting. I see MAMIE A. S. speaks of piecing quilts. As some others have said (or as good as said), I think it a waste of time and goods. I guess something else will be a little more interesting. I went to the Middle Georgia Fair, held at Griffin, last week. There were some fine-looking horses on exhibition. Farmers in this neighborhood are about done gathering corn.—LEWIS H. T., *Sunny Side, Ga.*

Quilting and Autumn Leaves.

DEAR RURAL:—Some time has passed since I have had a chat with you; and as you published my last, it has encouraged me to try again. I like the letter from MAMIE A. S., in RURAL, Oct. 21st, very much, and would like her to send me some of the quilt patterns she mentions. I have some very pretty ones, and probably she would exchange with me. Do you think she would? If she will I will send her my address. I will send a recipe for preserving autumn leaves to FLORENCE DELANO. It is as follows: Press your leaves in large books for three days; then varnish them, and they will be dry enough in a few days to arrange in bouquets. They look lovely, especially the dark red ones. When you have tried it, let me know how you like my recipe. Grass looks well crystallized. I suppose all the feminine Cousins know how.—ROSA LEE, *Va.*

From Canada.

DEAR SIR:—I thought I would write a letter, to ask if you would take me in as a Cousin, as so many are claiming *relation* to the RURAL. Well, how many of you have been to the Centennial this year and have carried off prizes? I have read the boys' and girls' letters with interest, and find some spicy things in some of them. I would like to know why the girls pepper YOUNG TOM so? If they have a reason, all right; if not, girls will get up one, I am sure. Well, if it was not for the girls what would the boys do? I think they would thin out pretty fast; I know they would in this part of the country. What is the matter with YOUNG SPORTSMAN? I would like to hear from him.—A., *Holbrook, Canada.*

Bessie's Regards.

DEAR COUSINS:—I noticed the criticism on my "History," and am glad to say that I agree with ONE OF THE BOYS in all but his last remark. Was JOAN of Arc a "plain, practical woman?" Let us submit the question to YOUNG EDITOR, No. 2. Before STORM expends all of his eloquence, let me suggest to him that to wait until there was an occasion for "war-paint" would be a good thing. It must be owing entirely to modesty that none of the boys wrote about JOAN, because, according to their own assertions, ability is not wanting among them. Girls, it is delightful to hear of modest boys now-a-days, is it not?—BESSIE MCLEAN.

Twelve Dolls.

DEAR MR. EDITOR:—I am a little country girl, seven years old. I have two brothers older than I. They go to school, but I have never been; would like to go, though. Mamma teaches me at home. I have several pets: A little dog, three cats and a beautiful canary. I have twelve dolls. As this is my first letter, I will not write too long. Your little friend—LOTTIE KING.

The Puzzler.

MYTHOLOGICAL ENIGMA.

I AM composed of 45 letters:
My 7, 34, 40, 25, 27, 10, 9 one of the Pleiades.
My 18, 44, 4, 16, 2, 6, 40 daughter of Laomedon.
My 1, 9, 36, 8, 5, 11, 42 a woman made at the command of Jupiter.
My 20, 34, 30, 4, 14, 40, 4 king of Ithaca.
My 17, 28, 12, 24, 34, 33, 14 son of Priam.
My 39, 10, 19, 45, 21, 44, 4 one of the Cyclops.
My 38, 11, 3, 41, 29, 45 ton of Neptune.
My 37, 31, 44, 9, 45, 33, 14 an ancient sea god.
My 35, 3, 8, 32 queen of Carthage.
My 13, 23, 7, 40, 34 what Ixion was fastened to for punishment.
My 34, 5, 15, 7, 10, 22, 32, 11, 34, 35 where Triptolemus became a judge.
My 43, 3, 6, 14, 26, 24, 1 relationship.
My whole is what Hercules at his death gave Philoctetes.

☞ Answer in two weeks. S. C.

GEOMETRICAL PUZZLE.

I AM constrained to plant a grove
To entertain the nymph I love.
This simple grove I must compose
Of nineteen trees in nine straight rows,
And in each row I five must place,
Or ne'er expect to see her face.
Ye men of art, pray lend your aid
To satisfy this curious maid.

☞ Answer in two weeks. J. P.

PUZZLER ANSWERS.—Nov. 4.

HIDDEN DRUGS OR MEDICINES.—1, Pill; 2, Mercury; 3, Poultice; 4, Blister; 5, Pennyroyal; 6, Manna; 7, Hops; 8, Chloroform; 9, Quinine; 10, Rhatany; 11, Ether; 12, Opium.

SHORT ANAGRAMS.—Cape Jessamine; 2, Debase; 3, Matron; 4, Papist; 5, Medicine; 6, Meander; 7, Matin; 8, Debate; 9, Mastodon; 10, Basket; 11, Cake turner; 12, Dust pan; 13, Dipper; 14, Broom; 15, Bucket; 16, Table; 17, Plate; 18, Mankind; 19, Harmony; 20, Calico; 21, Andes; 22, Alps.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.90 for the two, may select any two of the following-named plants and a paper of the seed of the Moluccа Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory or garden. Its growth is rapid—small plants attaining the hight of five feet during the summer months. In the fall it may be cut back to any desirable size and potted for the winter, when it will quickly recover its symmetry and resume its ever-blooming habit. Its quick and exceeding popularity is a sufficient guarantee of its merits.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is as yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class. It is difficult to select a more attractive plant than Marie Lemoine when freely blooming. Every truss is in itself a bouquet. The leaves are large, zoneless, vigorous. The plant is compact and, like *Abutilon Boule de Neige*, is invaluable, either for the conservatory, window or garden.

Hydrangea paniculata grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It has stood 26° below zero unharmed. It begins blooming in early August, continuing until after hard frosts. The thyrses of flowers, first greenish-white, then white, then rose, often measure a foot in length and twenty inches in circumference. Every stem being thus terminated, the striking appearance of an entire plant may be conceived. There can be no doubt that this is one of the most valuable of all perfectly hardy shrubs.

Variegated Ampelopsis or *Vitis heterophylla variegata*.—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green, much as *Abutilon Thomsoni* is variegated with green and yellow. From its racemes of flowers are formed fruit as large as currants, each one of which is a different color in shades of claret, azure-blue and green. These berries, which are first as soft as a currant, become finally as hard as bullets.

The pretty stems are also variegated, green, whitish and rose. The roots are perfectly hardy, and the vine's growth so rapid that it will cover twenty-five feet square in a season. For conservatory walls or pillars, for trellises or rockeries, it cannot fail to please. It has been growing in the RURAL EXPERIMENTAL GROUNDS for several years without the least protection.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the singular Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

News of the Week.

ELECTION.

SUCH intense excitement over an election has almost never been witnessed in New York City, as during the last week. The scenes at the Republican Headquarters at the Fifth Avenue Hotel, Democratic Headquarters at the Everett House and around the Newspaper Bulletins in Printing House Square, were more like the impromptu meetings in 1861 than anything which has been seen since. The closeness of the electoral vote and the bitter spirit in which the campaign has been conducted, seem to have culminated in an intensity of feeling which was increased, rather than diminished, by the suspense naturally caused by the waiting for the returns from those doubtful States which should turn the scale only a hair's breadth to elect either candidate. It is to be hoped that the verdict of the people will be accepted with that same good common sense for which our foreign visitors this year have given the American People credit.

HOME NEWS PARAGRAPHS.

ACCORDING to the reports of the city fumigators, the Chinese laundries in San Francisco are a fruitful cause of the spread of small-pox, as large quantities of clothing, taken from the bodies of people who have died of the disease, have been washed in them, and then exposed for sale.

Edward Hazleton, solicitor, representing the Foreign Bondholders' Association of London, is in Atlanta, Ga., on business connected with some of the bogus bonds issued under Gov. Bullock's administration and now held in England.

Of the 258,239 inhabitants of Rhode Island, 135,003 were born in the State, and 51,606 are natives of other States in this country.

A rumor of a proposed Fenian raid and massing of war material is not sustained by facts.

The German Empire has presented the German Pavilion in the Exhibition Grounds to the City of Philadelphia.

William Vandyke sailed from Grand Haven, Mich., on Sunday, 5th, with his family and an Englishman named Felker, in a small sloop bound for Florida, via Illinois Canal and the Mississippi. On Monday a tempest carried away the mast and capsized the vessel keel upward, a few miles from Saugatuck. The hatches had been nailed fast, and all were knocked about inside the hull till Tuesday morning, when they came ashore six miles north of Saugatuck. They cut their way out and found Felker dead. All were terribly bruised and exhausted. Robert Doesking, a farmer, took them to his house.

As we go to press the question, Who is President? is still undecided. Gov. Tilden has secured 184 electoral votes, and a majority on the popular vote of 542,800. Gov. Hayes has gained 166 electoral votes, with a majority of 238,800. The doubtful States are South Carolina, Florida and Louisiana. Gov. Tilden would have to secure but one of them to gain the day; Gov. Hays all. Both parties claim all of the States mentioned, and charges of fraud, etc., are equally balanced. The official vote will decide, and to attempt to secure a fair count delegations of prominent men of both parties have gone to the various State capitals, to be present at the official canvass.

Late advices state that the U. S. frigate Franklin arrived at St. Thomas on the 5th, with Wm. M. Tweed on board.

Race troubles in Virginia.

There is a dead-lock in the Vermont Legislature on the question of time for electing State officers.

Speaking of the new cotton crop, the Augusta Cotton Exchange reports:—The staple of all is superior. The crop has matured, and is being gathered and marketed with a rapidity seldom if ever equaled. It is the opinion of the Committee on Crops that this section is harvesting more cotton than last year by from 10 to 15 per cent.

Gold is being shipped to this country in large quantities from England.

Butler is elected in Massachusetts.

The house of the dead San Francisco banker, Ralston, is to be turned into a hotel.

The University of California has now over 300 students.

The following is the President's order:

PHILADELPHIA, NOV. 10.

General W. T. Sherman, Washington, D. C.:

Instruct General Augur, in Louisiana, and General Ruger, in Florida, to be vigilant with the force at their command to preserve peace and good order, and to see that the proper and legal boards of canvassers are unmolested in the performance of their duties. Should there be any grounds of suspicion of a fraudulent count on either side it should be reported and denounced at once. No man worthy of the office of President should be willing to hold it if counted in or placed there by fraud. Either party can afford to be disappointed in the result. The country cannot afford to have the result tainted by the suspicion of illegal or false returns. U. S. GRANT.

It is to be hoped that the subsidence of the election excitement will have a beneficial effect, for merchants are again complaining of the hard times. In the last week of October, shipments of grain fell off 500,000 bushels from the not very favorable figures that had previously been quoted. Although the business of the year has been very bad, each of the grain centers outside of New York has increased its proportion. The following shows the present ratio for the twenty-eight weeks ending October 28:

	1876.	*Per ct.*	1873.	*Per ct.*
New York	59,211,323	46.9	65,102,541	57.9
Philadelphia	22,075,340	17.6	11,025,005	9.8
Baltimore	15,877,935	12.6	8,175,572	7.3
Montreal	14,304,729	11.2	15,968,118	14.2
Boston	13,142,125	10.4	10,517,256	9.4
Portland	1,762,708	1.4	1,595,088	1.4
Total	126,247,170	100.0	112,383,580	100.0

An attempt was made at Springfield, Ill., to steal the remains of President Lincoln from the cemetery vault. The plot was suspected some time since, and Elmer Washburne, United States Detective Tyrrell, and his assistants watched the vault. The scoundrels broke in the outer and inner doors of the vault, opened the several cases of the sarcophagus, and were about to make off with the remains when the detectives accidentally discharged a pistol, which alarmed the robbers, and they fled precipitately, escaping in the darkness. A slight clew to their identity remains, and their capture is probable.

An agent of a hundred Chicago families is prospecting Florida for a settlement.

FOREIGN NOTES.

THE biggest gun in the world, Victor Emanuel's 100-ton infant, has fired its first shot at Spezzia with 330 pounds of powder and a ball weighing 2,000 pounds only. The hydraulic machinery by which only the monster can be moved worked perfectly.

The British Admiralty Board recently instituted an inquiry in regard to the number of transport ships the Government had at command in case of war. It was found that, with the addition of sundry steamers belonging to fifteen private companies, it had means of transporting to the Mediterranean, within three weeks, 90,000 men, with horses, cannons, and other war material.

There is said to be a paper church actually existing near Berlin, which can contain nearly one thousand persons. It is circular within, octagonal without. The reliefs outside and statues within, the roof, ceiling, the Corinthian capitals, are all *papier mache*, rendered waterproof by saturating in vitriol, lime water, whey, and white of eggs.

The Austrian Government has declined to take any part in the Paris Exposition of 1878.

A Latin military book, published in Paris in 1535, contains illustrations of a revolving gun, revolving turrets for monitors, a diagram of a diving bell, and other inventions of the nineteenth century.

The new Commander-in-Chief of the Chinese army, Li-Hung Chang, has already made himself the actual sovereign of the empire. He is regarded as the implacable enemy of foreigners and the leading opponent of progress. He was the second of five brothers, sons of a poor literary man. During the Taiping rebellion he offered his services to the Government, and besides rising rapidly in military rank, he gained much imperial favor. Although accused of the foulest treachery in beheading the rebel kings, whose lives he had guaranteed, after the fall of Soochow, he was created a noble, and invested with the yellow jacket, the highest honor in China for military achievements. In 1864 he founded the imperial arsenal at Nanking, and supplied it both with skilled workmen and all the apparatus necessary for making guns, torpedoes, rockets, shells, and other war implements. In 1865, after the fall of Nanking, he was made Governor-General; in 1866 he went north, and put an end to the Nieufi insurrection; in 1870 was ordered to fight the Mohammedan rebels in Shanshi and Kansey, but, while en route, he was recalled and made Governor-General of Pelehihli, and in 1872 was raised to the rank of a second-class noble. He is about fifty-five years of age, and holds his power by the system of nepotism.

Cardinal Simeoni, recently the Papal Nuncio at Madrid, has been appointed to succeed the late Cardinal Antonelli as Secretary of State to the Pope.

The choir of Salisbury Cathedral, in England, has just been reopened, after having been under restoration for years. As long ago as the summer of 1863, the work began with the expenditure of £10,000 upon the fabric, under the guidance of Sir Gilbert Scott. The first step was naturally to secure the stability of the famous spire. This has always been vaunted as the highest spire in England, and as one of the highest in Europe. The sudden collapse of the Chichester spire, some years ago, caused some anxiety as to the condition of its far handsomer sister at Salisbury. It was found by experiment that no movement of the apex had taken place for at least three hundred years; but assurance was made doubly sure by girding the tower with steel bands, and joining its angles by diagonal steel crossbars.

According to the German philosopher, Adelnay, the number of languages spoken in Europe is 587, in Asia, 937, in Africa, 276, and in America 1,264 making a total of 3,064.

Viscount Nogueiras, the newly-appointed Portuguese Minister to the United States, will proceed to Washington shortly.

Not long since the Minister of Justice at the Hague ordered an inquiry to be made into the number of convents and their inmates now in Holland, with a view of ascertaining how many monks and nuns have migrated thither from Prussia since the enactment of the Falck Church laws.

The Pope lately proposed to divide the Archbishopric of Lyons into two dioceses, without the assent of the French Government, and has met with decided opposition. The Government accepts the portion of the Papal bull consecrating a new archbishop, but rejects the provisions contained in it dividing the diocese.

A curious custom still maintained at Bavarian executions is that of the Clerk of the Court breaking a wand and throwing the fragments at the feet of the criminal. This is symbolical that his life is to be violently and suddenly terminated. It was done a few weeks since at Munich. The executions are not public.

Kullmann, who attempted to kill Prince Bismarck at Kissingen, not long since asked his father to present a petition for his pardon to the Prince, but his father refused to do so. This refusal enraged Kullman, and a few days afterward he assaulted his attendant, with whom he was walking, and struck him senseless to the earth.

The villa Bertramka, near Prague, where Mozart completed his "Don Giovanni," now belongs to M. Lambert Popelka. He has recently erected on an elevation in the garden a memorial to Mozart surmounted by the great composer's bust, and bearing the inscription:—"Here Mozart completed the opera of 'Don Juan,' October 28, 1787."

Six hundred and fifty troops have arrived at Havana, from Spain, Nov. 9.

The Temps publishes a telegram from Vienna which states that Montenegro, finding herself incapable of maintaining the troops in their present position during the armistice, has opened direct negotiations with the Porte for a prompt conclusion of peace.

The district of Backergunge, India, was ravaged by a cyclone. A thousand native houses were destroyed. The town of Dowlutkhan was submerged by a wave and 5,000 persons are believed to have perished. The Government has sent relief to the desolated section.

Cronstadt is ice-bound.

FRANK MILLER'S HARNESS OIL received the highest and only award at the Centennial Exhibiton.

INQUIRIES FOR ADVERTISERS.

[OWING to the many inquiries from subscribers concerning things that have a commercial value, and are offered for sale through the medium of newspaper advertising, we have deemed it for the best interest of all concerned, to classify our "Answers to Correspondents," so that each inquiry will appear under its appropriate head, either in "Inquiries for Advertisers," or "Answers to Correspondents." This, we believe, will enable advertisers to more effectually comprehend the wants of our subscribers, and will enable us to make our advertising columns what they should be—a true reflection of our readers' wants. This department will be edited carefully, it being our aim to use it in the interest of both advertisers and readers, and while we shall not hesitate to give our reasons for excluding bad or doubtful advertisements, all such other matter will be admitted as will be of legitimate interest. At the same time it must be understood that such inquiries as may appear must appeal to the advertiser himself for answer. The advertisement should answer the want, and the want is indicative of its need.]

R. Y. G., Nashville, Tenn., wants a good dairy farm in Southern Michigan.

H. B. M., Hamilton Co., Ohio., wants a good Food Steamer.

R. G. G., Walla, Walla, Oregon, wants a power Meat Cutter.

A. R. D., Clinton Co., N. Y., wants a Separator and Fan Mill combined.

B. M. G., Essex Co., Mass., wants Bronze Turkeys.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 11, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	101,812	Molasses	2,275
Whisky	3,113	Rice, bbls.	1,294
Corn meal, bbls.	5,516	Cut meats, pkgs.	21,770
Corn meal, bags	574	Lard, pkgs.	4,194
Wheat, bush.	575,452	Tobacco, hhds.	753
Corn, bush	477,040	do. pkgs.	2,424
Oats, bush.	186,252	Butter, pkgs.	27,972
Rye, bush.	23,268	Cheese, bxs.	38,003
Malt, bush.	6,225	Cotton, bales.	42,128
Barley, bush.	246,440	Rosin	11,224
Beans, bbls.	11,264	Spts. turp., bbls.	4,114
Grass seed, bush.	22,514	Dried Fruits, pkgs.	5,932
Beef, pkgs.	5,033	Eggs, bbls.	9,160
Wool, bales	1,847	Peanuts, bags	1,470
Hops, bales	1,281	Leather, sides	32,451
Pork, bbls	6,040	Sugar, hhds.	—
Tallow	1,645	Oil cake	9,514

BUSINESS during the week has been seriously interrupted by the fluctuating decisions attending the national ballot, and it is not probable that much solid wholesale movement will occur until the fever in political circles is broken. In most cases prices have remained strong, and nothing has declined to the extent that might be expected in a market so generally neglected.

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible: mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival here of summer items on Saturday.

BEANS AND PEAS.—Exports beans past week, 410 bbls.; since Jan. 1, 30,737 do.; same time last year, 29,692 do.

New mediums are firm, and there are indications of early good demand. New marrows are quoted 5c. off, as exporters are not purchasing freely. Few good old crop beans remain the best, if it is marrow stock. Kidney and pea are quiet. Peas are shaded in price in the prevailing inactivity of peas past week, 14,394 bush.

Beans—New medium, $1.25@1.90; do. marrow, $2.25@2.30; do. pea, $2.15@2.20; white kidney, $2.30@2.35; red do., $2.20@2.30; Old Beans—Medium, prime, $1.65@1.70; other, $1.40@1.55; marrow, $1.90@2; pea, prime, $1.80@2; white kidney, prime, $1.75@2; red do., prime, $2.15@2.25; other, $1.60@1.90; black, $2.70; Canadian peas, new, ₹ bbl., free, $1.12@1.14.; do., bulk, 92@93c.; green do., new, $1.45@1.50; do., S. B. E. peas (2-bush. bag), $2@2.25.

BEESWAX.—There is a little more stir to trade, with sales at 30¼@32c. for Western and Southern.

Exports past week, 2,489 lbs., since Jan. 1st, 61,173 do.; same time last year, 80,408 do.

BROOM CORN.—Supplies are fair, while the demand is light.

Quoted at 7@8c. for short green brush, 6½@7½c. for green hurl, 5@5c. for medium green, and 3@4c. for red and red-tipped.

BUTTER.—The lull created by the election particularly affects the butter trade, and we are likely to loose one or two weeks of what should be an active season. Prices, however, do not shrink badly on the fine grades. The supply of pretty good fall make is larger than credited. The early frost has put a good many old fancy reputation marks in the under rank of quality. In the eagerness of some holders to sell there has been considerable trade at the inside range. Taking the average grades of butter we think the tendency is for easier prices, especially as light trade and free receipts have caused considerable accumulation; latterly firkins particularly begin to make the stock feel burdensome. There is great complaint against the oversalting of Welsh tubs. Prime lots shown were actually gritty right through. About the only butter that has shown any real activity is fresh Western dairy; while factory packed is more easily placed on account of improved quality. A fair export demand for medium Western which materially helps the tone of the market for Western. Rolls are still running poor in quality. Exports past week 5,071 pkgs.

We quote:—Choice pails, 33@34c.; prime, 32@33c.; poor to good, 24@29c.; creamery pails, choice, 35@36c.; good, 33@34c.; sweet cream pails, 30@35c. State firkins, choice, 29@30c.; fair to good, 25@27c.; do. half firkin tubs, choice, 32@34c.; fair to prime, 26@30c.; do. Welsh tubs, choice, 30@31c.; other, 24@28c.; Inferior State, 15@19c.; Western creamery, choice, 34@35c.; other, 31@33c.; do. firkins, best, 21@23c.; other, 15@18c.; dairy tubs, choice, 24@26c.; other, 15@18c.; factory choice, 23@24c.; other, 14@18c.

State dairies quotable at 30@32c. with full tubs Welsh tubs, dairies, 26@29c.

State firkins dairies 25@30c. Welsh tubs dairies, 26@30c. Roll butter, fair to prime, 21@25c.; do., poor, 18@20c.

CHEESE.—This has been another dull week. The Liverpool market has been very quiet, but few orders have come forward. The chief demand has been for fancy-colored factories. These are taken, to a moderate extent, at 13½c., and some exceptional lots higher. Ordinary lots of fine factories range from 12½@13c.

Fancy factory at 13@13½c. for fancy white and colored; do., Job lots, 14c.; good and prime, 11½@12½c.; fair, 9½@11c. State farm dairy, fancy, 11½@12½c.; good to prime, 10½@11c.; fair and good, 9@10c. Western factory, fancy, 12½@13c.; good and prime, 11@12c.; fair lots, 9½@10½c.; do. half skimmed, 7@8c.; skimmed, 5@6c.

Exports for the week, 32,230 boxes.

CORN MEAL.—Sales at $2.20@3.15 for yellow Western, Jersey and Pennsylvania, and $3.35 for Brandywine.

COTTON.—With an excited Liverpool market, at marked advanced prices, there has been a sharp speculative margin, and a rise here.

The latest quotations are:—November, 12 11-32c.; December, 13 11-32@12½c.; January, 12½c.; February, 12 11-16@12 23-32c.; March, 12½@12 29-32c.; April, 13 1-16@13 3-32c.; May, 13¼c.; June, 13 7-16c.; July, 13 9-16c.; August, 13 21-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	10¾	10¾	10¾	10¾

Stained.

Good ordinary	10	Low middling	11
Strict ordinary	10¾	Middling	11⅛

DOMESTIC DRIED FRUITS.—Apples come in freely, and with a moderate export trade, prices are unsettled, favoring the buyer. Peaches are scarce and at very strong prices. Blackberries, raspberries and cherries favor the seller.

Apples—State, sliced, 6¼@7¼c.; do., quarters, 6¾@7c.; Southern sliced, new, 5¾@6c.; choice do. 7@7½c.; fancy, 9c.; do., new quarters, in bags, 4½c.; do., repacked, 5¾c.; Western quarters 5½c. Blackberries at 8½c. Peeled peaches, new, 18@19c.; unpeeled peaches, halves, 9@10c.; do. quarters, 8½@9c. Raspberries, 27@29c. Cherries, 17@17½c.

Exports past week 2,393 bbls. dried apples; or 5,379 bbls. more than for this date last year.

EGGS.—Last weeks prices have been well supported. Demand for limed stock is small. Canadian limed quoted as State. Extra fresh nears are scarce and higher. We quote:

Near points, 33@34c.; State and Penn., 28@29c.; Western, prime, 27½@28c.; do. other, 27c.; Canadian, 27@28c.

State limed, 21@22c.; Western, do., 18@21c.

ESSENTIAL OILS.—We repeat the late revision of prices. Market strong for peppermint, under good foreign advices. We quote:

Peppermint, $2.50 ₹ lb. in tin, $1.25@3.50 in glass—tone firm. Sassafras scarce and firm at 50c. ₹ lb. Wintergreen, large supply, weak at $2.50. Spearmint, nominally $2.50 ₹ lb.; no demand.

FRESH FRUITS.—Exports of apples past week, 15,644 bbls. The demand for apples brisk for city and export use, with low prices still current. Dealers seem wisely determined to get rid of the big end of the crop in the first part of the season, if possible. California and Boston furnish all the retailing pears—quoted at $3@4 ₹ box. The winter sorts of the former are selling well about. Quinces have sold slowly this season. Grapes steady. Domestic oranges are in good supply—quality of Louisiana not attractive; Florida sells best. Cranberries are quiet; they have a formidable antagonist this season in very cheap apples. Peanuts have largely declined.

Apples, State, ₹ bbl., prime red, $1.50@1.75; winter, $1.37@1.50; mixed, $1.12@1.25; good to fair, 60c@$1. Quinces, ₹ bbl., $8@12. California Quinces, $3@4 ₹ box; Cranberries, crates, $2.50@3.00; Eastern, good to prime, $7@9.50; N. J. $7.50@8.50, for good to prime. Grapes—Catawba, ₹ lb., 9@10c.; Isabella, 6@7c. Chestnuts, ₹ bush. $2.50@3.00. Hickory nuts, $1.50@2.; Va., fancy, $1.15@1.20; other, 70c.@$1.30. Oranges—Louisiana, ₹ bbl., $6; Florida, box, $5.

FLOUR.—This has been a very dull week. The advices from the other side have been unfavorable, showing dull and weak markets, and but few orders have been received. Meanwhile supplies are increasing and easier prices are accepted. We give sales at $4.35@4.75 for poor to very choice superfine State; $4.40@5.20 for very common to fair extra do.; $5.25@5.35 for good extra do.; $5.40@5.55 for fancy do., and $5.60@7.00 for fancy to very choice extra; $4.25@4.75 for superfine Michigan, Indiana, Iowa, &c.; $5.10@5.30 for shipping extra do., the inside price for inferior, and $5.35@5.45 for choice to very fancy extra do.; common to choice white wheat extras, $5.50@6.75; fancy do. $6.80@8.00; winter wheat, good to choice family $6.25@6.25; round-hoop Ohio, $5.10@5.25, and trade brands of do. at $5.30@7.00; St. Louis, $5.20@6.25 for common to fair extra, and $6.30@8.25 for good to very choice; Minnesota "straight" at $6.25@7.50, and patent at $7.25@9.50; unsound stock at from $3.25@5.00; city mill extra for West Indies at $6.10@6.25; do. English brands, $5.25@—; do. trade and family, $7.00@8.50; No. 2 at $5.30@4.00. Buckwheat dull and favoring the buyer; sales at 80c. Buckwheat flour ranges from $3 to $3.40, the latter for fancy.

FOREIGN DRIED FRUITS.—Layer raisins, $2.05 ₹ bbl., do. half boxes $1.20, do. quarter boxes, 60c. New Sultana raisins 11¾c. New Valencia raisins, $9¾@9¾. Currants 6½@6¾. Turkish prunes, 5¾@6c. for old and 9c. for new.

GRAIN.—The English markets have been very dull and prices relatively lower than here. This has caused a wholly nominal market for wheat. A decline is admitted, but there is no business beyond small lots. Prime new No. 3 Milwaukee spring has sold at $1.18¾; No. 2 Chicago spring, $1.23@1.24; No. 2 Milwaukee, $1.25; white Western at $1.33@1.31; winter red Western at $1.27@1.28. Rye quiet at 74@78c. for Western; 80@80c. for State and 88@90c. for Canada. Barley is in liberal supply and lower; No. 1 Canada sold at $1.15; six-rowed State ranges from 80 to 95c. Corn is lower and hard to sell; quoted at 55c. for new Western mixed; 55@60c. for old do. Oats are in small receipt and higher. Sales at 30@38c. for mixed Western and State, and 37@51c. for white do.

HAY AND STRAW.—Supplies are not large, and the rather quiet trade fails to influence prices.

Bale hay 60c. for shipping; 70@90c. for retail qualities; clover, 55@65c.; salt, do., 50@60c. Straw quoted at 75@80c. for long rye; 50@60c. for short rye, and 45@60c. for oat.

HIGHWINES.—Lower and dull; $1.09¼ is bid and $1.11 asked.

HONEY.—Low prices have at last stimulated trade and there is a prospect of a better market that is so far as working off the supplies is concerned. We quote White clover in glass 15@20c. Dark and buckwheat, 10@11c.

HOPS.—This has been a quiet market, this week and prices are lower. The arrivals have fallen off, but export demand is light comparatively; 35c. is a full rate now for choice lots in lines as required by exporters. The quotations are for

New Yorks, good to choice, new	32 to 35
New Yorks, low to fair, new	21 to 30
Eastern, new	30 to 34
Wisconsin, new	24 to 31
Yearlings	10 to 20
Olds, all growths	4 to 8
California, new	32 to 36

LEATHER.—Hemlock sole at 20@22c. for light, 24@25c. for middle, 21@27c. for heavy, 22c. for good damaged.

POULTRY AND GAME.—Live poultry is in light supply, but abundant enough, with the regular receipts of dressed. We quote live:

New Jersey turkeys, 13@14c. ₹ lb.; Western, 12@14c. N. J. fowls and chicks, 12@13c.; State and Penn., 10@11c.; Western, 10@11c., roosters, 8@9c. Geese, N. J., ₹ pair, $1.27@2; Western, $1.37@1.62. Ducks, N. J., ₹ pair, 62@87c.; Western, 50@65c. Live pigeons, ₹ pair, 22c.

The offering of dressed poultry is poor. Rough lots are shipped in the first place, and then softening weather still further hurts their appearance. Prime lots of turkeys or chickens sell readily. Don't mix fowls and chickens in the same package when lots are of commercial size.

Turkeys, N. J., 15@17c.; State, 13@16c.; Western, 12@15c. Chickens, dry-picked, 16@17c. N. J. chicks, 13@17c.; State, 12@15c.; Western, 12@15c. Ducks, N. J., 14@16c.; State, 12@16c.; Western, 12@16c.; Geese 14@15c. Inferior poultry has sold at 8@10c. Game is in large supply and prices favor buyers in most all items.

We quote.—Canvas-back ducks $1@1.25 for Havre de Grace and $1 for western. Red Head 50@60c.; Mallard 50c.; Teal 55c.; Widgion 30@35c.; common 25@30c.

Wild Ducks ₹ 50c.; Teal, Snipe ₹ doz. $1. Quail ₹ doz. $1.37@1.62. Partridge, State, 65@70; eastern 60@90c.; western 30@40c.; Prairie Hens 70@$1.; Hares 40@50c.; Rabbits 20@30c. Venison, whole, 9@10@10c.; long saddle 12@13c.; short do., short do., 11@15c.

PROVISIONS.—Export demand has been very light and a feverish, unsettled feeling prevails as to prices. Mess pork quoted at $17.25 for spot; mess pork for December and January, at $16, $16.10 for February and $16.15 for March deliveries. Bacon at 8¾c. for long clear and 9½c. for short clear. Western steam lard at $10.35 for spot; $10.15 for November, $9.92½ for December, and $9.95 for January. Stearine at 10½c. for prime. Beef hams at $19.50@20 for choice Western. Beef, barreled lots quoted at $8@10 for plain mess, $10@11 for extra mess, $13.50@11 for packet. Tierced quoted nominally at $16@21 for new prime mess and $21@23 for new India mess. City extra India mess at $27.

SEEDS.—Clover has a little more demand from shippers, selling at 11½c. Timothy quiet, quoted at $1.90@2.

SUGAR (Refined) quoted at 9¾@10¾c. for soft yellow; 10¾@11¾c. for soft white, and 12¾c. for crushed, 11¾@12c. for powdered; 12c. for granulated, and 13@13¼c. for cut loaf.

SUNDRIES.—Cider in fair demand at 8c. ₹ bbl; 12c. ₹ keg. Feathers, live geese, white Western, 55@58c; mixed, 40@50c. Ginseng, $1.10@1.20.

TOBACCO.—Export trade is moderate, but no change made in prices.

Wisconsin assorted lots	3 @ 5

VEGETABLES.—Exports of potatoes past week, 2,702 bbls.; of onions, 578 do. Potatoes have advanced. Prime Rose and P. B. are very firm. Sweet potatoes are also higher, with stock considerably reduced. Garden truck is quiet. Onions a shade higher. We quote;

Potatoes—Peach Blows ₹ bbl. $2.87@3.00. Early Rose, prime, $2.57@3; other $2.37@2.50; Peerless, bulk, $2.00@2.25; sweet, Del. $3.50@4; Va. $2.75@3. Cabbages, ₹ 100, $4@7. Marrow squash, ₹ bbl., 50@75c. New Russian turnips, ₹ bush., 75c.@—. Onions—Yellow, ₹ bbl., $1.75@2.00; white, $2.75@3.; red, $1.50@1.75. Cauliflower, ₹ bbl., $2@1.50

WOOL.—The excitement growing out of the political contest has led to a very small trade. There is a confident feeling respecting prices, and as the small transactions the quotations of last week are fully sustained.

ROCHESTER, Nov. 11.—Flour market steady; spring, $6.75; amber winter, $7.00; white winter, $7.50; double extra, $7.75. Rye flour quiet at $5.00. Wheat quiet; Milwaukee club, $1.20@1.30; amber winter, $1.25@1.25; white winter, $1.20@1.27. Oats, nominal at 34@40c. Corn quiet at 58@62c. Corn meal, $1.25@1.50. Butter, 25@26c. Cheese, 12@13c. Eggs, 23@24c. Lard, 10@10½c. Apples, bu., 25@50c. Potatoes, bu., 70@75c. Beans, ₹ bu., 80@$1.60. Mess pork, $17.00. Wool, 25@30c. Hay, $13@13. Straw, $6@8. Timothy seed, $2.75@3.50; clover, $9.25@10. Mill feed strong at $14 for shorts, $16 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 35c. ₹ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Nov. 11, 1876.

THERE has been but little doing in the market this week, owing to the occurrence of the election and general dullness in trade. There have been a few farm dairies on the market, and sales have ranged from 11 to 12c., according to quality. About 5,000 boxes of factory cheese were offered, of which more than half changed hands. The sales ranged from 12 to 13c., the latter figure being considered the top price for the finest of the September make. A good many factorymen thought the prices offered too low and are holding over for another week.

Butter comes forward quite freely, but prices are lower. The sales this week have been from 26 to 28c. for farm dairies in Welsh tubs, and 29c. for creamery and extra lots from farm dairies.

The weather is mild and pleasant, but there is very little feed in pastures, and cows are yielding poor returns.

We have advices from abroad for the third week in October. Our London correspondent says that English and American cheese sells well at previous rates. Secondary sorts are neglected. We give the prices as follows:

American, extra fine, 61@66s.; fine, 60@62s.; good, 54@58s.; secondary and low grades, 30@48s. English cheddar brings from 80@104s.; Wiltshire double, 60@76s.; Cheshire medium, 51@68s.; fine, 74@80s.; Scotch, 64@70s.

The imports of American butter are excessive, and that to hand is more or less injured with the heat. We quote:

Dorsets, 104s., Jersey, 130s.; Friesland, 151s@160.; Normandy, 120@130s.; American and Canadian, 85@125s., ₹ cwt. Oleomargarine sells at 90@104s ₹ cwt.

LIVE STOCK MARKETS.

NEW YORK, Nov. 4, 1876.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Sixtieth St.	4,307	9	1,046	9,517	00
Forty-Eighth St.	38	62	330	8,613	37
Fortieth St.	000	00	000	000	16,915
Hunsinus Cove	6,812	00	153	9,102	14,043
Totals this week	11,157	71	1,529	27,262	30,995
" last week	7,520	11	1,232	25,600	28,684

BEEVES.—Trade opened slow on Monday last on a rather heavy run of generally inferior quality cattle: Prices were 6@10¼c. ₹ lb., with a few top steers at 10¾c. ₹ lb.; weights, 4¼@10 cwt. The markets closed weak, with several herds unsold at noon. On Wednesday, trade very slow and quality not good enough to meet the demand. Prices were 6¼@10c. ₹ lb.; weights, 4¾@8¾ cwt. Thursday, trade small, at 7@10¼c.; weights, 5@8¼ cwt. Friday, the markets closed firm at 8@10¼c.; weights, 5@8¼ cwt. From 51@57 lbs., net, has been allowed. Spanish herds, direct from the Plains, 6@8¼c. Native steers, grass-fed, 7@9¼c.; do. part corn-fed, 9½@10c.; grain do., 10¾@10¾c. Mixed herds, cows, steers and oxen, 7@9c. Mixed herds, cows, heifers and steers, 8@8¾c. ₹ lb. Oxen, 8@10c. Bulls, live weight, 2½@3c.

MILCH COWS.—Trade rather easier. Nineteen cows sold at $40@60 ₹ head; 17 do. at $50@65; 10 do. at $55@70; 3 do. at $65@55; 16 do., poor quality, $30@38.50 calves always included.

VEALS AND CALVES.—This branch of live stock trade has been very dull. Smooth quality scarce and in light demand at 7@10c. ₹ lb. Coarse quality calves in over supply and slow of sale at 4@6½c., also at $6@$15 ₹ per head. State veals, 7@10c.; Pennsylvania do., 8@9½c.; Jersey do., 8¾@10c. State calves, 4@5c.; Western, 4¾@5¾c.; Canada, $6@10 ₹ head; State, $8@16 ₹ head.

SHEEP AND LAMBS.—There has been no activity in this branch of trade. The quality of the flocks has been from rough and lean to good; in general, rather inferior. Monday last sheep sold at 3@6c. ₹ lb.; lambs at 5@6¾c. Wednesday, trade small, sheep sold at 3½@6c.; lambs, 5¾@6¾c. Thursday, sheep, 4@5¾c.; lambs, 5¼@6½c. Friday, the market closed fair. Sheep, 4@5½c.; lambs, 5@6½c.; Kentucky, 4¼@4¾c.; State, 3@5c.; Ohio, 3½@6c.; Pennsylvania, 4¾@5½c. Jersey ewes, 4½@4¾c. State lambs, 5@6¾c.; Ohio do., 6c.; Canada, 5¾@6¼c.

HOGS.—Two car-loads of corn-fed Ohio hogs sold on live weight at $5.87½@5.90 per cwt.; car-load of rough State hogs at 5¾c. ₹ lb. City dressed slightly improved in feeling. Rates, 6¾@9¼c. ₹ lb.; general sales, 7¼@8c.

HORSE MARKET.—City trade much interfered with, owing to the general elections. Sales few. Rates firm. Twelve head, coarse quality, heavy draft horses, sold at $62@95 ₹ head; 22 head poor quality, light harness horses sold at $50@80; 30 do., $80@100; 25 ordinary quality, $115@130; 7 pairs family carriage horses, aged, $500@950 ₹ pair; 1 pair do., warranted sound, $1,300; broughams horses, course quality, $175@300 ₹ head; 2 pairs choice quality heavy draft horses, $525@575 ₹ pair; 30 mustangs sold at auction at $14@76 ₹ head; general sales, $20@41 ₹ head.

PERSONAL ITEMS.

THE Duchess of Aosta, ex-Queen of Spain, is dead.

THE man who bet his pay felt bad when he had to pay his bet.

A SUGGESTION to Arctic explorers—"Honesty is the best Polar-Sea."

MRS. SPILKINS'S midnight lectures on Masonry are always of a Lodge-ical tone.

MR. TENNYSON, report says, has written a new poem, which will be published shortly.

THE men who have made wheelbarrow bets on the election expect to carry all before them.

A CRAFTY fox was found lying dead drunk in a Massachusetts cider mill the other morning.

THE Burlington Hawkeye applauds the Centennial Commissioners for not naming a Smith day.

SENATOR SHARON'S big hotel in San Francisco pays $1,000 per day—on the wrong side of the books.

A GRAND Masonic Congress, the Paris papers say, will be held in that city or London next May or June.

PROF. THACHER of Yale College, has gone to California for his health, and will not return until next term.

SPURGEON says men with squeaky boots ought not to come to church. That's the reason so many don't.

TWO sons of Hon. John Bright have been spending the summer in this vicinity, quietly "doing" the Centennial.

A MAN-MILLINER drives one of the finest teams in London. He certainly should know how to handle the ribbons.

A MOTHER and her daughter married brothers in Tuscaloosa, Ala., and the mother got the younger husband.

TWO negro women met in Louisville by appointment, and fought with knives until both were painfully wounded.

IT is worthy of remark that when Dom Pedro went to call on the Sultan, his wife insisted on being along with him.

JOHN HABBERTON, the author of "Helen's Babies," will soon delight his admirers with "The Barton Experiment."

A ROYAL crown is being manufactured at St. Petersburg for Prince Milan, and a sword of honor for Tchernayeff.

THE Sultan has taken another epaulet-ptic fit, and ordered that his officers shall wear simple shoulder straps no longer.

THE latest production of Paul Heyse, the German novelist, is a drama the publication of which is awaited with great interest.

DAN RICE is making his usual farewell tour this year, and has just been sold out by a Kentucky Sheriff—which is also as usual.

A DOG was saturated with coal oil and set fire to the other day at St. Louis. A reward of ten dollars is offered for the purp-etrator.

FREILIGRATH'S German translation of Coleridge's "Ancient Mariner" is to be published in Leipsic this month with forty illustrations by Dore.

KALAKAUA is a thrifty potentate. He was deadheaded all over this country, and then charged the Sandwich Islands $50,000 for making the trip.

CAPTAIN NARES'S return from his unsuccessful expedition leaves it still an open question which nation will first run up its colors on the North Pole.

MR. S. T. BACON, a Boston gentleman, says that he was the first to suggest that this country should celebrate the Centennial year by an Exposition.

IT will be a matter of disappointment to many to learn that Sergeant Bates has decided not to carry the Russian flag through Turkey just at present.

"PREPARATIONS for closing the Centennial," eh? How odd that sounds now that we've all become accustomed to consider it a regular permanent show!

IT is not considered a subject of laughter in New Haven to see a young woman prowling around with a cowhide, looking after a theological student.

IT is now definitely settled that all the Centennial buildings are to be knocked down—at auction, that is. But why did they name Thanksgiving Day for the sale?

MR. NORWOOD, the new United States Senator from Georgia, is the son of a tanner, and forty-six years old. He is one of the most inveterate jokers in the State.

THE old adage, "Don't look a gift horse in the mouth," has been improved on. Burbank of the New Orleans Republican, says, "Never look a gift mule in the hind foot."

THERE are 540 monasteries and convents in Russia, the revenues of which amount altogether to $6,500,000. The cost of maintaining each monk or nun during one year amounts, on the average, to about $110.

DON CARLOS was present the other day at the annual service in Paris in commemoration of the foul execution of Marie Antoinette. The members of the Orleans family were satisfied with sending their apologies.

CHICAGO gas rates have been reduced to $1.50. Courtships, however, are still conducted with a very exaggerated idea of economy, as the young people put out the lights and sit in the dark every chance they get.

TUPPER continues to read his own poetry.

SOME of the young ladies in Beacon Street, Boston, are giving dinner parties, which they prepare themselves, fairly outdoing the late Professor Blot in some lines. This certainly is a healthy sign of practical progress.

ONE of the British scientists has been at work on dog's brains. He finds that the brain of man's faithful friend is smaller than that of the wolf, and that the brain of a Newfoundland dog is very little larger than a terrier's.

SCENE in a New York Police Court—Judge—"Prisoner, I find you guilty of intoxication in the public streets. The punishment is ten dollars or ten days. Which will you take?" Prisoner—"I will take the ten dollars, your honor."

THE Duc d'Aumale, son of King Louis Philippe, and now commander of the Eighteenth Corps of the French army, had his shoulder bone dislocated recently by a fall from his horse. The animal shied at a cow, and the Duke was jerked into the road.

TWO Waltham, Mass., men have a novel bet on the election. The loser is to go to Boston, hire a hand-organ, bring it back with him, and play it on the streets a certain number of times, while the winner passes round a hat and pockets the pennies.

SOMEBODY in a distant part of the State wrote to the White County (Ark.) Record inquiring where the Rev. Edward Thompson was, and got the following reply:—"This is Brudder Thompson, now in jail for stealing a poor colored woman's money."

THAT explosive machine has acted like magic in reforming the baggage smasher. The tenderness and care with which he now picks up each Saratoga and deposits it on the platform makes one feel that even villains have their mission to fulfill in this world.

A REMARKABLE porcelain tureen was recently sold in Paris for 492 francs. It bears a painting representing the execution of Louis XVI, at the moment when Sanson, the famous executioner, who is admirably portrayed, holds up the dead monarch's head to the populace.

TWO enterprising Jerseymen have just patented "an apparatus for preserving food." To our thinking, the best of all ways to keep provisions from spoiling is to turn a pair of good healthy children loose in the pantry three times a day. None of your apparatuses are needed where they are.

THE following is the answer of a newly-married Dayton man to the invitation of a Philadelphia friend, who wished him to visit the Centennial: "You are very kind, but since I married and became familiar with the mysteries of a woman's wardrobe, variety shows have lost their charm for me."

CALCULATIONS have been published showing that over twenty-three millions of animals and birds were wounded without being captured, by the licensed sportsmen and poachers of the British Islands, during the year ending March 31, 1876. The vivisectionists are completely eclipsed by this cruelty.

WHEN he was a pugilist they called him Ned Wright. Now he is the Rev. Edward Wright, and is putting up a $5,000 church in Chamberwell, London. The converted Ned is said to be a thoroughly changed man, and very successful in his work. He is a fearless preacher, and quite eloquent in his way.

THE statement that Charles Sing of North Adams, is the first Chinaman who has taken out naturalization papers in this country is incorrect. Mr. Charles Ar Showe, a well-known tea merchant of Boston and a native of China, was naturalized in 1860, and has voted at every Presidential and State election since that time.

COLONEL CHESTER, who has been writing about the peculiarities of Westminster Abbey, has discovered that Major Andre's remains were brought from America and interred in the Abbey in 1821, by direction of the Duke of York. He has investigated the history of Andre's family, and finds that it originated at Nismes.

THE Spectator pours balm upon the ruffled soul of the British farmer by informing him that it is not the doryphora decemlineata, but the doryphora juncta that has arrived in England from America. Not to put too fine a point upon it, 'tis not the potato bug, but an allied species—a sort of high-toned first cousin, who is above a potato diet.

"THE Right Honorable Dr. John Bright, M. P.;" such is the full designation of the famous British tribune of the people. Williams College, in New England, where of old the Quakers were persecuted unto death, has conferred the degree of Doctor of Laws upon the greatest living member of the Society of Friends, and the degree has been accepted by him.

AN Omaha girl recently married a man whose features were nearly obscured by a heavy growth of whiskers. "Now," said she, at the conclusion of the marriage ceremony, "my first anxiety is to get that hair off of your face, so that I can see what you look like. I've married a pig in a poke, so far as your features are concerned." The barber had a call that day.

OSCANYAN, the well-known Oriental lecturer and late Consul-General of Turkey in New York, is to have a seat in the new Senate about to be formed by the Turkish Government as one of the representatives of the Armenians, who are to have ten members in that body. Mr. Oscanyan was not long ago elected a member of the National Assembly of the Armenians.

Implements and Machinery.

Centennial Year of American Independence.

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you samples of the Celebrated Watches, manufactured by our countrymen, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION. These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, the Ruby Jeweled, set in Chaton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

H. B. P., Argyle.—(1.) We do not know what will remove walnut stains from the hand without injury to the skin. The stains will wear off in a short time. (2) There is no one work on Entomology which gives the names, descriptions and habits of all the common insects to be found on the farm. "Harris' Insects Injurious to Vegetation" is a very good work for the novice, but it contains the names of but a very small proportion of the most common kinds. It costs $4. "Packard's Guide to the Study of Insects" is another work at the same price. It embraces a much wider range than that of Harris, but is not so entertaining nor so simple. The two volumes of the "American Entomologist" edited by Prof. Riley are very valuable to one who desires to learn something of native insects. We think the volumes can be had of the Editor, Prof. Chas. V. Riley, St. Louis, Mo. (3.) We have no doubt that the statement to which you refer is correct, as it is very well known that the honey-bee makes out of pure honey the wax of which the cells or combs are formed. The pollen gathered from flowers is supposed to be used as food for the young grubs or larvæ, which eventually become the winged insects. You can find all these points fully explained in any good work on bee-keeping.

E. C. R.—Wash the lumps in the cat's ears with strong camphor, and if caused by parasites, this will destroy them. A weak solution of carbolic acid will also answer. Never having seen such warts or lumps as you describe in a cat's or other animal's ears, we cannot account for their appearance.

Geo. H. R.—"Charlton's Grape Grower's Guide," which costs only 75c., will furnish you with the desired information in regard to forcing grapes under glass. As you ask our opinion in respect to the culture of grapes under glass as an "investment," we will say that a great many more persons have found the business unprofitable than profitable.

B. C. P.—(1.) It may be that you give your plum trees too much manure, which would, perhaps, account for their not bearing more fruit. But as high culture would not cause unproductiveness when the trees attained some age, we are inclined to think that plum curculios are about. These insects sting the plums while they are small, causing them to fall off, and this is why the crop is short. There is not the least difficulty in raising large and healthy plum trees anywhere about this city or over in New Jersey, but the curculio makes short and clean work with the fruit, consequently few persons try to raise plums in the region of country named. (2.) We cannot tell how to prevent pears becoming knotty or cracking open before they are ripe, as is so frequently seen in such varieties as the *Virgalieu* and *Beurre Diel*. Ashes put around the trees and over the ground as far as the roots extend will do good, if anything; but a never-failing preventive for cracking of the fruit or for blight upon the branches remains to be discovered.

Thomas H.—Many a time have we answered your question in the negative, and we now repeat, "Cows cannot, and never do, lose what is termed the *cud*." What a sad predicament all "ruminant" animals would have been left in by their Creator if they were liable to lose their cud every time somebody gave them a kick, chased them down hill, or when they happened to cough suddenly from getting a little haysced or dust down their throats! No, no! Nature puts a better finish to her works than all that, and ordinary accidents are provided for. The very name of the order of animals to which the cow belongs, *Ruminantia*, or Ruminants, explains the philosophy of what is called "chewing of the cud." Ruminate means to remasticate or chew over. The ox, cow, sheep, goat, deer and other animals belonging to the order of Ruminants "bolt" their food somewhat hastily and almost whole, depositing it in the first stomach, and then, at their leisure, bring up a little at a time to remasticate, when they again swallow it, this time sending it to the second stomach or receptacle. This remasticating is termed "chewing the cud," and it is nothing more or less. Cows do not lose their cud while there is anything remaining in their stomachs to be remasticated.

Mrs. D. L. B., Salem.—Will you tell us how to care for mocking birds—the food they require to keep them healthy, and how to distinguish the male from the female? ANS.—Procure mocking-bird food from trustworthy bird dealers. It is put up in pint and quart cans. Provide them with cages large enough for them to exercise in. It is difficult to state in writing what are the differences between the male and female that enable bird fanciers to determine almost at a glance the one from the other. We may say that the white of the three upper feathers of the male wing extends up higher (*i. e.*, toward the head), and it is a more solid white than in the same feathers of the female, in which it is often speckled or mottled with black or brown.

Subscriber.—If lime, magnesia and sulphuric acid be placed together, the sulphuric acid unites with the lime only, forming sulphate of lime, and the magnesia is left out in the cold, having nothing upon which to bestow its affections.

A. C. Bacon.—The term "Landscape Gardener" was, according to Loudon, first adopted by Hamphrey Repton.

W. H. Prentice.—Will you please send to Floricultural Editor your address?

Dry Goods, &c.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

BETWEEN

NEW YORK AND CHICAGO

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Wit and Humor.

HIS MULE.

"SPEAKING about mules," remarked a six-footer from Harnett County, as he cracked his whip at the market yesterday morning, "I've got a mule at home which knows as much as I do, and I want to hear somebody say that I'm half fool."

No one said so and he went on.

"I've stood around here and heard men blow about kicking mules until I've got disgusted. When you come down to kicking, I want to bet on my mule. A preacher came along and took dinner with me the other day, and as he seemed a little disheartened I took him out to see Thomas Jefferson, my champion mule. I was telling the good man how that mule would flop his hind feet around, and he said he'd like to see a little fun. He'd passed his whole life in the South, but had never seen a mule lay his soul into a big time at kicking.

"Well," he continued, after borrowing some tobacco, "I took Thomas out of the stable, backed him up agin a hill, gin him a cuff on the ear, and we stood back to see the amusement. It was a good place to kick his darndest, and what d'ye spose he did? In ten minutes he was out of sight. In five more we couldn't feel him with a twelve-foot pole, and—and—"

The crowd began to yell and sneer, and the old man looked around and added:

"Does anybody think I'm lying? Would I lie for one mule?"—*Raleigh Sentinel.*

SHE WOULDN'T SPEAK TO HIM.

WHEN a young Chicago man came down stairs the other morning he remembered that his wife, who was preparing breakfast, had not spoken to him when she got up, and so he cheerfully said: "Good morning, little lady."

Not a word came in reply.

"Good morning," said he again, in a higher key, thinking that she might not have heard him before.

"Um—'m—'m," was all that escaped from her sealed lips, as she kept on with the work.

"Why under the sun don't you answer me?" exclaimed he in surprise: "what's the matter? what have I done to offend you?"

"Um—'m—'m," was still the only sound elicited.

"Look here!" then exclaimed the husband, as he jumped up and knocked over a cup of coffee: "I don't swallow a mouthful of this breakfast until you tell me what's the matter."

"What's the matter?" echoed she, suddenly turning upon him with flashing eyes. And then, she continued: "John Adell Smithson, the next time that I dream I see you kissing another woman, I—I—I will leave this house!—boo-hoo!"

SPARKS AND SPLINTERS.

ARTILLERY horses are hitched up with the tugs of war.

WHAT variety of plum does Cain represent?—A Damson.

INSTRUMENTS of torch-er—Capes and transparencies.

THE boy who is early to bed doesn't generally take early to rye-s.

WHY is Christmas like a general mistake? Because it is a comin' nearer (common error).

SOME one ruminates sadly in the Chicago Journal:—"The white gloved beau of last night, leaning over the ballustrades and twirling his silky mustache, may next month be a fond husband leaning over an icy stove, and preparing a cup of morning coffee for a thin-lipped woman with a hawk bill nose put on bias."

NOT long since a dark, mahogany-colored female obtained a position in a San Antonio family as a cook. A few days after she met an acquaintance, who inquired how she liked her new place.

"Ise gwine to leab em," was the answer.

"Dey 'buses you, does dey?"

"Dreffful. Wuss den foah de 'bellion. Dey locks up all de pervisions and asks foah de change from de market money."

"Why, dat's no better den stealin'!" was the indignant reply.

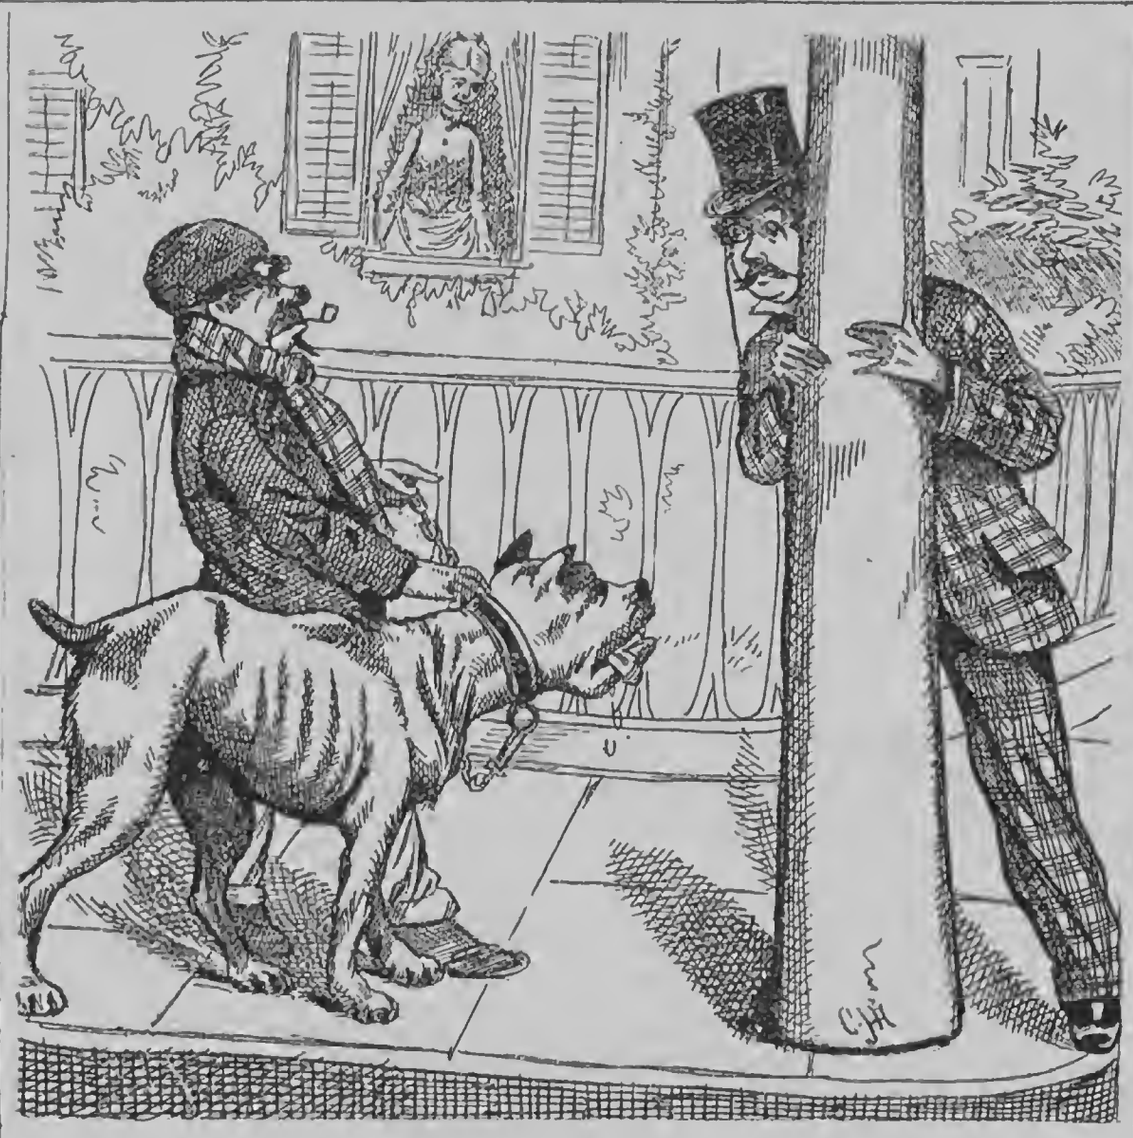
DIALOGUE IN A CEMETERY.—Wife—"Ah, husband, do you see this beautiful carving? How delicately cut in the pure white stone!"

Husband—"Yes. Very pretty."

Wife—"But, William, you have no taste for art, and you don't enjoy these things as I do. Just notice this slender column of immaculate marble, with the touching question, so beautifully carved: 'Do they miss me at home?'"

Husband—"Yes; I see. And here is her name on the footstone: 'G. A. B.' Yes; I guess they miss her if that was her name!"

And there came silence.—*Juniata Sentinel.*



VERY LIKELY.

MAN (with dog for sale).—You'd better buy him, mister, and if he don't mind yer, jest give him a good lickin.

RURAL RATES REDUCED!

IN announcing the reduction of the subscription price for THE RURAL NEW-YORKER, we can only say that it is done in a spirit of justice to all our subscribers, who are now paying reduced prices for everything. The old price for THE RURAL has been $2.65 per annum, and the

Present Reduced Rate is $2.50 per Annum,

and in clubs of ten or more, $2.

Great encouragement has been given us in our efforts to make the

BEST ILLUSTRATED

Agricultural and Family Weekly

ever published, and we make, in this Centenary Year, this substantial acknowledgment of it. It now costs us less to make the paper, and we propose to give our subscribers the benefit of every cent of the reduced cost.

ALL WE ASK

is that each subscriber and agent will continue his efforts to increase our list so that we can make a still further reduction.

The cheapest paper is not always the best, but

The Best Paper is Always the Cheapest!

Subscribers, show THE RURAL to your neighbors and ask them to subscribe. They will be benefited and you will be profited.

ALL AGENTS ATTENTION!!!

Increase your lists at the reduced rates and get larger Premiums.

The Naturalist.

THE JERUSALEM ARTICHOKE.

THERE are many persons who show, if they do not express in words, a disposition to undervalue everything that does not come within the limits of their personal wants or needs. The Jerusalem Artichoke is one of those plants which may not possess any particular value in localities where the Potato, Beet, Turnip and similar roots can be produced cheaply and in great abundance; but these favored localities are somewhat circumscribed; besides, droughts of extreme severity sometimes occur in regions where such plants succeed best, and insects, like the Colorado Potato Beetle, occasionally destroy the potato crop, leaving the farmer very short, if not entirely destitute, of roots for his stock.

Taking these accidents to crops (if we choose to call them such) into consideration, it must be admitted that a plant which will supply a large amount of nutritious food for stock, under adverse circumstances and at a small cost, ought to be looked upon with favor. This we claim for the Jerusalem Artichoke, and no more. It will thrive and yield an abundant crop of tubers under conditions that are destructive to the common Potato and other ordinary root crops, and hence may be considered one of the few plants upon which the farmer may depend in times of the greatest scarcity caused by long and severe droughts. As an instance of the growth and productiveness of this plant under unfavorable conditions, we may mention our own experience with it the past season.

Last spring we cut up a quantity of the tubers into small pieces with but a single eye or bud on each. These were scattered in a trench made with a plow and then covered two or three inches deep. The soil in which they were planted was dry, light, sandy loam, only moderately rich. We did not have rain enough from May to the 1st of September to wet the earth to the depth of three inches, and corn, sown for fodder alongside of the Artichokes, made a growth of bout two feet in hight and then dried up, when t was mown to save it. But the Artichokes kept steadily on during all this drought and reached a hight of about nine feet, blossoming freely, and some of the stems were fully an inch in diameter, with numerous lateral branches. During the past few days we have been digging some of the tubers, which literally filled the soil for a foot or two on both sides of the rows, and at a rough estimate the yield would not fall far short of 300 or 400 bushels per acre. We counted the tubers upon one average-sized stalk and found 96 of fair size and a few very small ones; and we have only to regret that our stock of this edible tuber is not a few hundred or a thousand bushels instead of a few dozen, as the root crop in our neighborhood is a very poor one, and Artichokes could be used or disposed of to advantage this season.

Now, the point we urge in favor of this old and long-known plant is this: It will thrive in dry seasons and in localities where other root crops fail, consequently may be used to take the place in part or to supplement more valuable kinds, in thousands of instances where a scarcity of nutritious roots causes immense losses to the farmer and severe suffering to animals.

The tubers are quit hardy in nearly all the Northern States, and especially in dry, loose soils, and if they are not needed one year, they may be left in the ground and a full crop will be produced the next. An acre or two of these roots on a farm would be a magazine of food to be drawn upon when other sources fail. Hogs will fatten upon them and will dig them for themselves, and even sheep will unearth the tubers lying near the surface.

When dug and stored for winter use, they may be fed to all kinds of farm stock, and horses and cows eat them with evident relish. Out on the Plains of the West, where there is always more or less danger of droughts and visits from grasshoppers, the Jerusalem Artichoke could scarcely fail to be of great value to the farmer, for if the leaves should be eaten off once or twice during the summer, the entire crop of tubers would not be destroyed, as would be the case with Sweet or Irish Potatoes, for the Artichoke possesses great vitality and is difficult to kill, except by digging it up or mowing off the stem several times during the growing season.

The leaves are also greedily devoured by stock and sheep, and cows are fond of them. In France and throughout Southern Europe the Artichoke is cultivated as a forage plant, and we learn that it is also grown to some extent in our Southern States for the same purpose.

ITS HISTORY.

The Jerusalem Artichoke is the *Helianthus tuberosus*, or Tuberous-rooted Helianthus. It is a perennial, tuberous-rooted, herbaceous plant, found growing wild in Brazil, and was introduced into Great Britain in 1617. It was formerly highly esteemed, but the common Potato proved to be much superior for ordinary culinary uses that

JERUSALEM ARTICHOKE.

the Artichoke was neglected in nearly all the northern parts of Europe and America. It is still used, however, for pickles and cooking (see Domestic Department of the RURAL of last week).

THE ILLUSTRATION

on our first page shows this flower of natural size and a large leaf taken from the main stem, while smaller ones of similar form are abundant upon the many lateral branches. The small bracts or miniature leaves are numerous upon the flowering branches, as shown. The flowers are yellow and similar to, although of smaller size than those of the common Sun-flower (*Helianthus giganteus*).

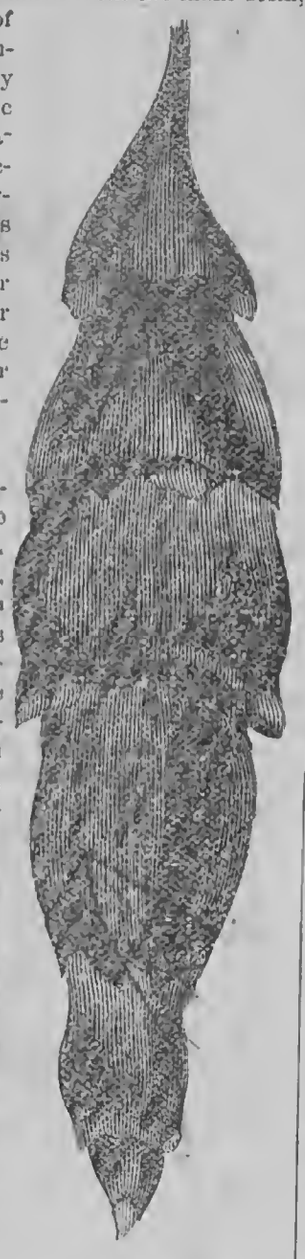

FIG. 1.

VARIETIES.

We have two distinct varieties of the Jerusalem Artichoke. The first is a long, slender tuber, often much branched, as is sometimes seen in certain varieties of the Potato, but the general form is shown in Figure 1. The skin, when the tubers are taken from the ground, is a deep, purplish red, the flesh white, tender and sweet. The stalks are very large and of dark-brown color near the ground, but green above. The side branches are very abundant and large, the foliage affording a great amount of succulent fodder for cattle. For want of a better name, we will call this the "Long Purple Artichoke." The second we will name the "Round White," for the tubers, until half-grown, are as round as a Baldwin Apple, but upon reaching maturity they become elongated, slightly tapering to the end nearest the stem, as shown in Fig. 2. The skin is white, with a very delicate shade of red; flesh white, brittle and sweet. The tubers average considerably larger than the first, but are not quite as numerous. The stalks produce but few branches, and the color of the bark is pale green, with scarcely a shade of purple or red. On our own grounds this is the better of the two sorts, at least it appears to produce larger tubers, which is an advantage as regards gathering and feeding.

FIG. 2.

The illustrations given of the two sorts are from medium-sized tubers, not the largest or smallest, as grown this season from single buds.

We think that a plant possessing so many merits as the Jerusalem Artichoke should not be neglected, and that every farmer can well afford to devote a small space at least to its culture. Those of our readers who may reside in regions of country where long and severe droughts are likely to occur very frequently, should try this plant as a sort of insurance against scarcity of food for their stock, even if they do not value the tubers for table use. Of course neither of the varieties named will take the place of the common Potato for culinary purposes, still, in times of great scarcity of the latter, they may be used for making many a wholesome and delicious dish, as they are both wholesome and nutritious.

If any of our readers should desire to procure a small quantity of the tubers of either of the sorts named, we would refer them to the special offer among "Publisher's Notices," on another page of this issue.

Industrial Topics.

GRASSHOPPERS' CONVENTION.

THE grasshoppers, of course, held their various conventions earlier in the season, and have long since adjourned for the winter, but the Governors of several of the Western States have, of late, met in council to consider this subject of grasshopper depredations, and to devise means and ways of preventing them in the future. A full report of the proceedings of the convention has not, as yet, come to hand; but, from the associated press dispatches, we learn that a committee of three was appointed to collect and issue in pamphlet form all the more practical means based on experience for the destruction of grasshoppers. The following resolutions were adopted: That it will be wise and politic for the Legislatures of the States and Territories most deeply interested to enact a law offering a bounty per bushel for the collection and destruction of eggs and unfledged insects; that the several Legislatures authorize local taxation for the proposed systemized efforts in the way of ditching, burning, etc., also to suggest the repeal of the game laws or a modification of them so as to prevent the destruction of the birds which feed on insects; the prevention of prairie fires until a suitable time for the destruction of young grasshoppers by firing the grass, encouragement of tree culture for the harboring of birds; recommending that as far as possible a survey be made of each State during the coming winter to ascertain those portions in each county in which eggs are most thickly laid; further, that they deem it the duty of the national government to make some effort to destroy or counteract the great pest and thus prevent its injuries; recommend the attachment of a special commissioner to one of the government surveys sent annually to the West, and that $25,000 be appropriated for the purpose of paying the expenses of the commission. The president of the convention was requested to draw up and present to the President of the United States a letter setting forth the urgent necessity of the action of the general government in behalf of the sections ravaged.

The Governors of Minnesota, Illinois, Iowa, Kansas, Nebraska, Missouri, Colorado, Wyoming, Dakota and Idaho were requested to transmit to the respective delegations a record of the proceedings of the convention and request them to urge on Congress speedy action in this matter. It is ascertained that the grasshoppers have not done the amount of damage imagined, and that they can be encountered and exterminated with much less labor and difficulty than heretofore supposed. By united and concentrated efforts at the proper time, no fears need be entertained as to serious results the coming spring.

THAT CORN HORSE.

IN the RURAL of the 4th inst., on page 297, I notice that one of your correspondents stigmatizes the corn horse as a nuisance, and reflects on its employers in the remark that "the use of it may amuse boys and greenhorns, but cannot be approved by men of sense." Now, Mr. Editor, with your permission, one of these greenhorns purposes to give his experience in the use of this convenient implement. For fifteen years I have used one of them and would not think of having my corn cut without it. My shocks always stand up steadier than if set round a hill, and experience has proved that in cutting fifty shocks I can remove the corn horse from one to another in as short a time as your correspondent would take to tie and set up his initial armfuls for the same number of shocks. I also take six rows; but only thirty-six hills for a shock—nine in each corner of the horse. Of my corn this number will generally average a bushel per shock. If it takes fifty-four hills of your correspondent's corn to yield a bushel, his crop is as poor as his objections to the corn horse.

Dairy Husbandry.

SCIENCE IN THE DAIRY.

IN the recent address of X. A. WILLARD before the National Agricultural Congress at Philadelphia, after referring to the wonderful progress in dairy manufacture flowing from JESSE WILLIAMS' invention of the associated system, he made the following remarks:

In what I have said I do not wish to attribute all the honor of our present position to American investigation or to American originality. We have no scientist who can claim any range of investigation concerning milk and its products that will at all compare with those made by Dr. VOELCKER of London. The "Germ theory" may be said to belong to HALLIER & PASTEUR. It is true, we are indebted to Prof. CALDWELL of Cornell University for first expounding this theory to American dairymen. The weight of his authority as a believer in it, has had considerable influence with dairymen toward the acceptance of PASTEUR'S investigations, and in applying the theory in explanation of some of the problems concerning milk.

Microscopical investigations to bring out results worthy of credit require the eye and mind of the trained scientist, great patience, long experience and a peculiar aptitude for the work. It is one thing to look through a microscope, but quite another thing to be able to designate correctly what one sees. Hence, the observation of the mere tyro must be taken with due caution.

Our best cheese as now made is, in all its essential principles, the same as that originated in Somersetshire, and which has been in practice for more than 100 years at the foot of the Mendip Hills. All theories in vogue from time to time diverging from these principles have ultimately proved failures in practice. You will say that we have been improving the character of American cheese for the last ten years or more, and that it never suited the English market so well as now. I grant it, but it is because we have come nearer and nearer the true Cheddar method which was first made known to our Dairymen at their Annual Convention in 1865. I do not refer to appliances for abridging labor; there are, of course, original American inventions, but I have yet to be shown a single original scientific principle that has been discovered and adopted, by which our cheese manufacture has been improved above the old cheddar method.

The lesson which our dairymen are learning to-day is that there is a difference between speculative theories and sound practice. We have learned the reasons for many dairy operations, and these have been so well expounded, from time to time, that our cheese makers have become better grounded in the science of the dairy and are more intelligent than the great mass of practical dairymen in Europe. But there are some things concerning the care and preservation of milk that may be placed to our credit. The cooling and aeration of milk for its better flavor and condition are ours. Mr. FOSTER of Oneida, N. Y., was the first to discover that the odor of putrifying animal matter, like that of a dead horse, may taint the milk in the bag by being breathed by the cow while at pasture. The microscopical investigations of Prof. LAW of Cornell, were the first to show how vegetable organisms may be transmitted to the milk from water which cows drink to slake thirst. Mr. FREEMAN of Chenango Co., was the first to discover that other fat than that obtained from the milk may be substituted for it in cheese.

The late GAIL BORDEN of White Plains, N. Y., was the first to show how milk may be successfully eliminated of its water, or condensed. He was an original thinker and investigator whose name, next to JESSE WILLIAMS', will go down to posterity as the inventor of the grandest improvement in connection with the dairy known in any age of the world. The preservation of milk, in all its integrity for long periods, before Mr. BORDEN'S time, had been attempted but without success, and eminent chemists and scientists had pronounced the condensing of milk with its cream unseparated an impossibility. Mr. BORDEN persevered—inventing complicated machinery entirely original for the purpose, and at last his efforts were crowned with success.

Thousands of our soldiers during the rebellion, thousands upon shipboard, in cities and upon the plains, have called down blessings upon this man, for the benefaction of securing to them the luxury of pure milk, milk which could not otherwise be had. If the lives of children saved in our cities, by the use of BORDEN'S milk, be taken into account, we shall scarcely be able to estimate the value of his labors. His inventions and processes have been carried into Europe and he is recognized in history to-day as one who has done an important service for humanity.

Mr. SLAUGHTER of Orange Co., N. Y., was the first to adapt the associated system to butter-making, and to apply the deep setting of milk in cold water for getting the cream. This was an important step toward progress in butter-making. The Swedes and Danes were the first among European Nations to copy the American idea of butter factories, and the setting of milk in cold water, but Sweden, with her scientists under Royal patronage, was not content simply to copy, and to Sweden belongs the credit of first demonstrating that cream will rise rapidly and perfectly when the milk is reduced to near the freezing point of water. This principle has been a surprise to the butter dairymen of America, and is another step in the progress of butter dairying.

Mr. HARDIN of Kentucky, is entitled to credit for a modification of this system in which the air is cooled in refrigerator boxes, which are used for setting the milk, and he claims as an improvement the covering of the milk and the exclusion of air while the cream is rising. There can be no doubt, but the cold theory is the true one for making butter. It arrests decomposition from the start, and the fine quality of butter made under this plan is proof of its merits. The heating of milk and then cooling it to obtain the cream, together with the manufacture of the skimmed milk into cheese is of ancient origin. It has been practiced in Devonshire, England, for more than a century, and hence no claim can be made of its being an American idea. The English experimentors, years ago, pronounced it inferior to other methods then in common use, both as to quantity and quality of product.

In closing the claims of American investigators I must add two more names to the list—that of Dr. STURTEVANT of Massachusetts who has made some original investigations in regard to the milk globules of cows of different breeds; while Dr. H. A. MOTT of New York City, has recently made some very interesting discoveries in comparing the milk of different races. His analyses show that the milk of the black race contains more milk solids than that of the Caucasian, particularly in milk-sugar, fat and inorganic salts. The same rule also applies to Brunettes, and it becomes an interesting question whether the color of animals is any indication as to the quality of milk yielded.

FEEDING DAIRY STOCK IN WINTER.

MESSRS. EDITORS: I have a dairy of 35 cows, and would be greatly interested to learn, through your columns, whether it pays in the State of Illinois, where the price of corn is from 25 to 30c. per bushel and bran $12 per ton, to cultivate roots for milch cows. If so, which are the best? Also, will it pay to steam or scald their meal and bran in winter season, under the same circumstances, paying $20 per month for help? —DAVID RISSER, *Orange, Ill.*

REMARKS.—In comparing roots with other kinds of cattle food, like corn, bran, etc., we get better results, practically, from the roots than their analyses would seem to show. That is to say, a bushel of roots—though containing a lower percentage of nutritive elements than a bushel of corn, may be so fed in connection with the corn as to give as good results as when the same quantity of corn is fed in place of the roots. This may seem an extraordinary statement to one who consults the tables of analyses of grains and roots; for the latter, it will be seen, contain a large proportion of water in their composition, but from numerous experiments at the manger, the roots always show a better result than their analyses would seem to indicate. Livery men tell us that horses will do more work, have a sleeker coat and be healthier when carrots are fed in connection with oats; and that 3 bushels of oats and one of carrots are better in their results than 4 bushels of oats.

Roots assist digestion and promote a more thorough assimilation of other foods. They improve the health of stock in winter when dry foods are the chief dependence, and as the improved health of stock is an important element in dairy management, the dairyman will find it of advantage to grow roots for his stock. In New York the expense of growing turnips and mangolds is from 6 to 8c. per bushel. They ought to be grown much cheaper in Illinois, because the soil is easier worked and is generally better adapted to root culture than most of the land in New York. Our most successful dairymen are of the opinion that it pays well to raise roots for dairy stock, and we are quite certain it will pay to grow them in Illinois, even at the comparatively low price named for corn and bran. Roots promote a flow of milk, and as a spring ration for "cows in milk," if fed in connection with corn meal and bran, they will be found of very great advantage.

Corn meal, when fed alone, is not the best kind of food for cows in milk. It is of a too heating nature, and when fed in considerable quantities, is apt to derange health, inducing gorget and other disorders. Dairy stock is often very much injured by injudicious feeding with this kind of food. If a liberal supply of roots is used in connection with corn meal, the

diet will be improved, resulting in a more generous supply of milk and better health of stock.

Of the different kinds of roots usually raised for cattle, we find, on the whole, the best results are obtained from the yellow globe mangold. The mangold is an excellent keeper, and is, therefore, available late in spring. It gives no bad taste to the milk—an objection which is often urged against turnips; it grows well in a variety of soils; is not liable to attacks from insects; it is easily harvested; and from all these good qualities, we should give it the preference. The parsnip makes excellent milk, but it is not so easily grown as the turnip or mangold.

When hay and grain are scarce and at high price, it may pay to steam or cook the food of stock; but at the rates named and cost of labor, we should say decidedly that it would not pay. Where considerable quantities of straw are to be utilized—if it be cut and mingled with meal and bran and the whole then steamed—it furnishes a good ration for stock, and when fodder of all kinds is expensive, quite a saving is not unfrequently made. But, at the low price named for corn and bran, the cost of preparing the steamed ration would more than counterbalance the amount saved in feed. In a recent number of the RURAL we referred to some of the advantages and disadvantages of cooking food for stock. Our correspondent would do well to consult that article.

THE PHILOSOPHY OF DAIRYING.

DR. E. LEWIS STURTEVANT of Waushakum Farm, South Framingham, Mass., gave an address at the adjourned meeting of the American Dairymen's Association held on the Centennial grounds, Philadelphia, Oct. 17–18, his subject being "The Philosophy of Dairying." The New York Times quotes from this address as follows:

MILK.

"Milk is a complex fluid: it has structural and chemical affinities, and partakes in its reactions, after withdrawal from the udder, of those qualities which its constitution and history have impressed upon it. Its structural element is a morphological one; that is, it has a form. This form-element is mechanically mixed with the milk, and is subject, in its relations to the rest of the milk, to the physical laws attending a mechanical mixture. Its chemical elements are compounds formed from elements in a high combining number, and which are readily changed from slight causes which tend to disturb their equilibrium. One, the sugar of milk, is a crystalloid, while the nitrogenous materials are colloids; this is to say, that these two classes of bodies are acted on differently by animal membranes. The bulk of milk is composed of water, a substance rather inert in its chemical relations, transudative in its relation to membranes, and influential as a media for the proper distribution and dilution of the more sought for elements."

To the above Philosophical views of Dr. STURTEVANT, the N. Y. Times, which does not seem to think much of the Doctor's philosophy, gives the following comments:

The above scientific and eminently lucid description of milk was recently given to a meeting of dairymen. Now that we know precisely what milk is, we do not wonder that we have wrestled with it so frequently or so unavailingly in the churn, nor that the average dairyman should be so pestered with its tricks; nor that the milkman should be astonished beyond measure at its "disturbed equilibrium" in his cans; nor, seeing that "its bulk is water," that the housekeeper should be able so easily to discover in daily practice the absolute truth of the scientific discovery, and should look so vainly for "the more sought for elements" in their "high combining number," which change so readily as to evade detection. Seriously, we notice this to protest upon the part of dairymen against such incomprehensible jargon as this being offered to them as science. Such efforts as this to popularize science are worse than useless.

PERFECTED BUTTER COLOR.

THE New England Farmer, speaking of Butter Color says:

Occasionally, during the past two years, we have received for trial samples of butter coloring preparations from Messrs. Wells, Richardson & Co., of Burlington, Vt., with the request that they should be thoroughly tested and criticised as to their merits and demerits. Knowing the firm were striving to make the best preparation possible, and that they intended to stop at nothing short of perfection, we have been free to find all the fault that could possibly be detected.

The first sample received, however, was quite superior to any other preparation of annatto that we had ever used. It was perfectly clear of sediment, free from odor, and gave a bright, clean color to the butter, while it was sold cheaper, according to its strength, than anything we had previously bought. But it was not warranted to keep through the whole year, without being injured by freezing in winter, or molding in summer. A later sample proved equal to these tests, and showed greatly increased strength of the coloring principle. Having tested it for several weeks, we informed the proprietors that we could find no fault with it whatever. As now made, it is a strong, clean, pure, and very cheap butter and cheese coloring substance. It will bear heat or cold, and does not fade when exposed to the light. It should entirely supersede carrots for coloring butter, and also all crude preparations of annatto, as formerly put up by druggists.

Since Wells, Richardson & Co. announced the manufacture of their "Golden Extract," the prejudice against the use of artificial coloring in butter has been swept away at a rapid rate, not only among butter makers, but also, among the dealers and their consumers. Being perfectly harmless, simple, cheap, and easily used, it has become one of the staple articles of the dairy room, as much as salt or rennet. For ten cents the proprietors will send any one a sample. Let all butter makers try it.

The Poultry Yard.

"COITSTOCK," MR. HENRY BELDON'S RESIDENCE.

DEAR RURAL: I have long promised myself the pleasure of a visit to the poultry yards of Mr. Henry Beldon, the famous English breeder, and last week, on leaving London for a week's stay in Yorkshire, I mentally resolved that before my return to the city I would see some of the thoroughbred fowls that have made their owner's name so famous at the great fairs of the kingdom.

At the great fairs or "shows," as they call them here in England, Mr. BELDON'S birds are the center of attraction and when some trio strikes your eye as being particularly fine, you may be quite sure that you will be told "these are HENRY BELDON'S birds," for the gentleman's exhibits are always first-class, and are seldom beaten anywhere, North or South. He exhibits a great variety of fowls, and yet when he sends one of his trios into some district where that variety is extensively bred, he is almost invariably a winner. For instance: the North is the home of the Hamburgh; there it is bred extensively, and breeders have an immense number to choose from in making up breeding pens or exhibition trios, yet Mr. BELDON, with his Hamburgh's, will carry off first prize from the heart of the "Hamburgh country." It has been said by some disappointed exhibitors that Mr BELDON "is a favorite with the judges," and that "much of his success is due to his personal popularity or influence." I have taken occasion to inquire into this matter repeatedly, and I have met with but one answer: that, although Mr. BELDON is undoubtedly a favorite, because his exhibits are always first-class and his dealings straightforward, yet his success as a prize-winner is the result of a thorough knowledge of the science of breeding, of years of careful selection, of patient waiting for results, and of good judgment in the care of his stock. What more is necessary to win success, and yet what one quality from among these could be spared if a like success were to be desired?

I thought over all this, as I have written it down, while I was comfortably curled up in one corner of the railway carriage on my way to Bingley, having nothing to do but to lazily smoke and look out on the lovely Yorshire fields and hedges, now in all the glory of their summer verdure.

Arrived at Bingley I stopped at the "Golden Fleece," and asking how far was Mr. BELDON'S place from the station, was informed that Mr. BELDON lived at "Coitstock," about three miles from the Inn. "Could I have a cab?" "Certainly;" and I was ushered into an old-fashioned Inn parlor, whose heavy draperies, quaint windows, high, antique chimney piece, and great hearthstone, were made ruddy and cheerful by the glow of the logs crackling on the great andirons. While waiting for the "cab," which, in this instance, turned out to be a very nice dog cart, drawn by a smart handsome horse, driven by an obliging man, (New York hackmen please take notice). I discussed the merits of a chop and some ale, and then we were off for "Coitstock."

A drive of three miles, according to my informant, but about five miles, according to distance as measured by a conscientious New York hackman, brought us to Mr. BELDON'S place, and as I looked down upon it from the brow of the hill, I saw at once how admirably its situation was adapted to the uses to which Mr. BELDON puts it.

Imagine yourself on a beautifully-wooded hill; below you, in a miniature valley, a level plateau of the richest coloring, the grass as green as the richest emerald; the woods which encircle it not too thick, but of beautiful foliage; the whole shut in by lofty hills, thickly wooded, and completely shielding this little valley from any rough winds; through the valleys center a lovely stream; at one end of the vast lawn, upon which we are looking down, an English cottage, bright and pretty and picturesque in its appearance; among the trees, at one side of the lawn and not far from the cottage, an old stone mill, some five stories high, weather beaten and gray in its old age, but still solid and massive, and contrasting prettily with the fresh grasses and flowers growing close about its base. This is "Coitstock"—HENRY BELDON'S pretty seat, and here, in the luxury and comfort of the old mill, live his pets, the winners of the great shows of the kingdom.

A few moment's drive down a road shaded by trees of a century's growth, and down a lane bordered with the tall hedges, so common and so pretty an acquisition to all English landscapes, brought us to the cottage door, and as we drove up we were met by a tall, portly gentleman of about fifty-five, of pleasant face and easy carriage, who came forward smiling cheerily as I asked for Mr. BELDON, and added that I was from America.

"I am Mr. BELDON," he said pleasantly, "and I am very glad to see you. Pray come in with me; I will have my man take your horse. I have many friends in America, and am always glad to see any gentlemen from your country."

So saying, he shook me warmly by the hand as I stepped from the dog-cart, and we went indoors together.

The house is a pretty one, and as you enter by the main hall the drawing room is on your left. It is a cheerful, sunny room, prettily hung in light colors, its French windows opening out on to the lawn. Here Mr. BELDON keeps many of his elegant gold and silver cups won by the "pets in the mill," and as we looked over the trophies, I saw the dates of the greatest shows in England, and records of competitions that were so hardly contested by exhibitors that the possession of the cup was indeed a trophy of which its owner might be proud.

On the right of the main hall is the dining room, a pleasant, cozy room, hung in crimson, if my memory serves me right, and to this room we adjourned, after a look at the cups, to enjoy a glass of some rare old port and to talk over American and English theories in breeding, and the advance made during the past ten years in the newer country in developing and originating varieties.

As we sat there I had an opportunity of studying my host, and this is such a pen portrait as I can give you of him.

He is tall, stout, and well made; about fifty-five years of age, I should say; his hair and side-whiskers gray; his countenance an open, pleasant one, and his eye gray, soft, and laughing. Add to this a hearty, merry laugh, a noticeable "Yorkshire accent," a genial manner, and you have Mr. HENRY BELDON, the first among English breeders.

"And where do you keep your birds, Mr. BELDON?" I said.

"In the old mill," he replied. "Let us finish our wine, and then we will go to the mill and see them."

And just here it occurs to me, dear RURAL, that I am running to such length in my chat with you that I am encroaching upon your good nature and your paper's space.

I will finish my letter just here, and say, as do the weeklies, "To be continued in our next," leaving until then an account of the Old Mill and Mr. BELDON'S prize winners.

THOS. W. WHITE.

Alden House, Kensington, London, '76.

Sheep Husbandry.

DO FINE SHEEP PAY?

IN conformation with the advice we have frequently given our readers, in regard to the value of choice breeds of stock and the advisability of keeping none but the best, we quote from a letter of Mr. JEWETT of Independence, Mo., published in the Journal of Agriculture, in which he gives some interesting facts, from his own experience in raising choice sheep, which it may be well for some of our discouraged sheep breeders to ponder over before disposing of their flocks. He says:

"I will begin with leaving Vermont. I emigrated to Missouri in 1869, bringing with me 77 choice American Merino ewes and one ram, Green Mountain. My first clip was 10 lbs. I have made great improvement in my sheep and wool, which will be evident when the average of first clip is compared with my last clip. I will say on the start that Missouri is one of the best, if not the very best wool-growing sections in the world. My sheep are larger than formerly and I think have increased the length of staple and a better circulation of oil, which has added much to weight of fleece. My flock of 102 head averaged 17.47 lbs. each of choice wool; sixty-one of these were breeding ewes of various ages; thirty-six were ram and ewe lambs. Five rams sheared as follows:—Gold Fleece, 31¾ lbs.; Seager, 31½ lbs.; Modoc, 28 lbs.; Michigan, 26¾ lbs.; Wooly, 26½ lbs. These rams were all shorn at a public shearing. Two ram lambs sheared respectively 20 and 21¾ lbs., first fleece. Twenty-two ewes averaged 19 lbs. each. An important item in improving a flock is to get good pure-bred rams, that have good form, heavy necks, well-covered, good legs and head. These slim-neck, small-leg, narrow-chested rams with a pedigree as long as your arm won't do. Sheep need attention and good care while young, if you wish to grow them to good size. In starting of course it is best to begin with full-blooded stock, but if from financial inability this plan cannot be pursued, the next best plan is to get native ewes and grade up by using good Merino rams. By this means all can soon have a flock of good grade sheep. The half and three-quarter bloods make fine mutton, are very hardy and are good shearers. My experience is that they will shear from 6 to 10 lbs."

Our colemporary adds:—Mr. Jewett has just made a sale of 35 rams to W. F. Bowne & Dodd, River Bend, Colorado, at the following prices: ram, Gold Fleece, for $200; Seager, $100; Modoc, $85; 8 at $45 each, and the remaining 24 at good prices. In view of these prices, who will say that sheep-raising does not pay? Mr. Jewett finds that it pays him and we are satisfied that Bowne & Dodd will find that their recent purchase will add to and give character to their entire flock and be a paying investment to them. They have shown their good sense in that they did not make a pilgrimage to the Atlantic coast and pay larger prices and get no better, if indeed as good sheep as they have bought nearer home, and at much less expense in traveling.

The Herdsman.

TREATMENT OF SHORT-HORNS.

MR. G. W. DANIELS, in an exhaustive article in the Farmer, (Eng.) on the Short-Horns, as compared with other breeds of cattle, gives some facts in regard to feeding, which are, of interest to those who may contemplate raising thoroughbreds of this celebrated breed. It is certainly well known to all breeders of stock that niggardly keeping for several consecutive generations will undoubtedly curb the generous tendencies which selection and liberal nurture have induced, and at length destroy them. Over-forcing ruins milk productiveness, weakens the constitution, causes disease, and impairs, often totally destroying, fertility. Under either extreme of management the most sagacious judgment in the choice and mating of animals would be exercised in vain.

To begin with the calves—there is no doubt that they thrive in the most satisfactory manner if they are allowed access to their mothers when they choose. I believe with animals of very high pedigree the mothers give so little milk that it is usually necessary to provide wet nurses for their offspring. On the other hand, the calves can be weaned when a fortnight or three weeks old, and taught to drink skim milk from a bucket; in this way they thrive wonderfully well, and it is surprising how soon they learn to eat cake, if they are supplied with the best linseed kind broken up into small pieces about the size of a hazel nut. I am in the habit of rearing calves in either way. I believe that it is impossible to feed young animals too well, and that they will repay any trouble or expense one is disposed to bestow upon them.

During the first winter I always allow my young stock hay, roots, and cake, and the second winter cake and straw, and a little hay if my hay ricks will afford it. I am aware we are advised to feed our stock on cotton-cake in preference to linseed, in order that the value of the manure may be enhanced. With this idea I totally disagree. I must say I prefer that my animals should be well cared for in the first instance; if I am assured that they are thriving and putting on flesh, I am quite satisfied the manure which they leave behind them cannot be very bad. Further than this, I consider linseed cake much more digestible than cotton.

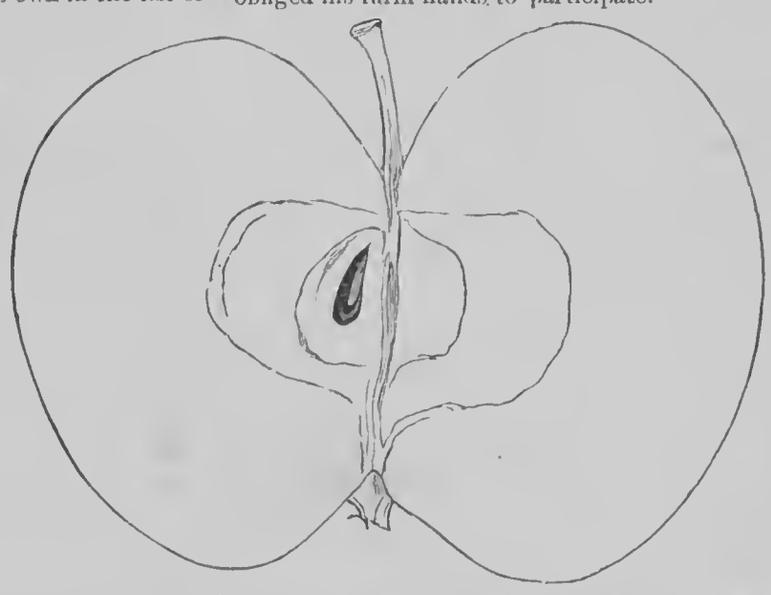
I must here express my surprise that any farmer can allow his dry cows and heifers to exist on straw alone during the winter months. It appears to me almost a symptom of insanity to place animals, coming off grass in the autumn in fair condition, to starve on straw in the winter, when the outlay of a little money in the purchase of a small quantity of cake and a few pounds given every day would enable the animals to come out of the straw yards in as good condition as they were when they went in. I have heard of animals dying as the result of this treatment, and of their falling or rolling into the ditch and being unable to get out again. With 3 lb. of the best linseed cake and an unlimited supply of fresh sweet straw and plenty of water I have had animals in blooming condition all the winter.

In many other counties tenant-farmers are large breeders of pedigree Short-Horns, and, as far as I have seen, their animals are much to be preferred to animals kept for fancy and show purposes, for I believe that pure bred cattle will do more for the profit of the farm than cross-bred animals.

Pomological.

THE JEFFERIS APPLE.

Among the many good old Pennsylvania apples, the Jefferis still holds its own in the list of choice sorts. It originated in Chester County, Pa., where it has long been quite popular, and it also has some reputation in other States. The accompanying outline shows its general size and form. The growth of the trees is moderate, but they are wonderfully productive.



Fruit medium oblate, inclining to conic, yellow shaded and splashed with crimson and thickly covered with whitish dots. Stalk very short, inserted in a rather large cavity; calyx closed, set in a round, open basin. Flesh white, tender, juicy, with a rich, mild sub-acid flavor. Ripens in September, and is generally conceded to be a first-rate sort.

CIONS FROM NURSERY TREES.

Years ago, the question as to whether the cions taken from trees growing in the nursery were as good, or would come into bearing as early as those from old orchard trees, was pretty thoroughly discussed in our horticultural journals. We believe it was then conceded, by men having had most experience in propagating trees, that no perceptible difference could be observed in the fruiting of cions taken from old or young trees. But these long-a-go discussions have, in a measure, passed out of the reach of the young orchardists of the present day, and it is but natural they should ask questions on this point, for the world travels in a circle, as it were, and each generation is likely to want the same kind of information as the one immediately preceeding it. Our young nurserymen and orchardists need have no fear of using cions from healthy young trees, whether they are standing in nursery rows or planted out and of bearing age.

MANURING THE STEMS OF APPLE TREES.

It is doubtless a safe rule to act upon, that the roots of a fruit tree extend out laterally as far as the branches. In a neighboring orchard are fifty apple trees, so old, many of them, that large branches are dead or dying. The proprietor with a view probably of invigorating or resuscitating these old specimens that might better be cut up into kindling wood and their room filled with young and vigorous trees, has dumped around each perhaps a quarter of a load of fine old horse manure, forming a cone with a base not more than four feet in diameter. Last fall these old trees were treated in the same way. Whether it was because the effect was highly satisfactory or because there was no effect at all and he was determined to test what he believed to be a tip-top plan by a second year's application, that induced its repetition, we can not say. Certain it is that the same amount of manure might just as well have been piled about the posts of the fence surrounding this orchard for all the good it would work upon the apple trees. Not less than twelve loads of manure were thus squandered, worth at least in the aggregate twenty-five dollars. Right here, good reader, pardon us if we tell you an incident from which, in connection with the above, a valuable lesson may be drawn.

Four years ago, we were laboring to carry a great number of lawn and bedding plants through a severe local drought—and to this end we were watering, or mulching them, we forget which, upon a Sabbath morning. We were almost a total stranger in the neighborhood which we had selected for our home. Along drove the proprietor of the above orchard—a German farmer, sixty years of age and, stopping his horse in the road directly opposite to where we were hard at work, angrily asked:—"Do you know vat day it is?" The question was so odd that we doubted our ears, and we replied—"What did you remark, sir?" "Do you know," he repeated more angrily than before, "vat day it is?"

Willing to await the sequel of so strange a proceeding, we replied amiably—"Yes, sir." "Then you had better stop your work!"

Now granting that it was wrong to work on a Sabbath morning even to save one's drooping plants—this farmer's method of rebuking us seemed so rude and public that we indignantly exclaimed—"Had you not better mind your own business!" "Yes," he bellowed, "I'll mind my own business and yours too"—and drove on before we could reply had we felt so disposed!

Upon inquiry, we found that this Christian German farmer deemed it no sin to load his farm wagon with market truck on Sunday night so as to be ready for an early start for market the following morning—and in this work he obliged his farm hands to participate.

Now we have waited four years for this Christian German farmer to fulfill that promise, viz., attend to our business as well as his own and we are driven to the conclusion that if piling manure about the stems of old apple trees is a fair specimen of the way in which he "minds his own business" we should never voluntarily engage him to attend to ours.

The moral is this:—If our German friend would spend a trifle for an agricultural paper and read a little more and think less of others' affairs, he would put less manure about the stems of his old apple trees and more money into his pockets.

Arboricultural.

THE CHESTNUT.

In a late number of the Rural New-Yorker I noticed an article in reference to transplanting the Chestnut, and with your permission will note some facts in regard to it:

The Chestnut tree has some of the peculiarities of the Hickory, in this, that it has but few side or lateral roots, and it is a well-known fact to all tree planters that there is a great difficulty in making trees do well, after transplanting, that have but few lateral roots. Such trees may indeed live, but they are very likely to make but a very slow growth.

The Hickory, Black Walnut, Chestnut, Wild Plum and many other trees have a long tap-root and will grow quite indifferently after transplanting. Hence the great cause of the little favor with which the Chestnut is looked upon by tree-planters generally.

Nine-tenths of all tree-planters obtain their supplies of trees and shrubs at the nurseries, regardless of the fact that some varieties of trees bear transplanting badly, on account of a very deficient supply of roots, and for this reason the Chestnut is one of the most difficult to transplant successfully.

I have upon my grounds two Chestnut trees that were transplanted in the spring of 1866 that are now only about eight feet high and seven inches in circumference a foot from the ground. They are apparently healthy, but have made such poor growth that if I had not had other experience I should discard the Chestnut tree as entirely worthless for any purpose. The same spring (1866) I planted a quantity of Chestnut seeds just where I wanted a grove. These came up finely and grew 10 to 30 inches the first season. They were slightly covered the first winter, and afterwards left exposed to test their hardiness. I have since found them as capable of withstanding the climate as any of our native trees, and they are now, at eleven years, from 20 to 30 feet high, and from 12 to 20 inches in circumference. Nearly all of them have borne fruit for five years, and in size and rapidity of growth they are not much inferior to most other deciduous trees for lawn or grove, and are much more valuable.

As transplanted trees they are, for the foregoing reasons, almost worthless, and most persons who have tried them by transplanting have had such indifferent success that nearly all are ready to pronounce them worthless. So well fixed is this fact in the minds of the people generally that at the meeting of the Iowa State Horticultural Society at Des Moines, Jan. 16, 1872, the then newly-elected President would not permit even a moment's discussion on the Chestnut, but immediately rapped the speaker down, saying that the Chestnut was so entirely worthless as a tree for any purpose that he would not allow any time to be wasted in its discussion.

Storrs & Harrison deserve the thanks of this nation for saying so much in favor of this valuable tree; but within the experience of nearly all those who have tried it in the entire West, it has proved a great failure to endeavor to make it a success by transplanting.

Now, this President probably had the same experience that nearly all others have had in transplanting the Chestnut, and jumped at the conclusion that the tree was too worthless to waste the time of the Society in its discussion. My own experience and observation, however, have taught me that it is one of the most rapidly growing of trees when the seeds are planted just where the trees are expected to remain, and these will need no more care after the first year than either an Oak or a Hickory. They will grow rapidly and make a delightful grove, and in five or six years will begin to bear fruit. My grove of 110 trees has been the admiration of all who have seen it.

Storrs & Harrison are experts in the preparation of Chestnut seeds, which they grow as readily as so many grains of corn. I would rather pay ten prices for seed in the spring, prepared and sent out by this firm, than take two-year-old trees for transplanting as a gratuity.

Not less than one hundred thousand farmers in the West should plant Chestnut seeds next spring, and with the same protection that should be given an orchard for the first five years, all will be astonished at the rapid growth of their trees. When in full foliage the Chestnut is one of the handsomest of our deciduous trees, and it is valuable for its fruit and timber.

D. W. Kauffman.

Des Moines, Iowa.

[With all due deference to the opinion and experience of our correspondent and despite the foolish assertion of the President of the Horticultural Society named, we still hold that Chestnut trees may be, and have been, transplanted with as great success as the Apple, Pear, Plum, Peach and Cherry. Give them the same preparatory manipulations in the nursery, and there will be an abundance of lateral and fibrous roots either upon the young or old trees.

Chestnut trees sent out from nurseries may be injured during transit, and when planted out barely live, remaining sickly and feeble until finally they die, just as Apple, Pear and other fruit trees have done in thousands of instances; but this is no good reason for placing the Chestnut among trees difficult to transplant and make live.

We happen to reside in a region where Chestnut trees abound, and we have also had considerable experience in transplanting seedlings from the nurseries and trees from the woods, consequently our conclusion in regard to the facility with which the Chestnut may be removed is not founded upon theory, but upon practical experience.—Ed. Rural.]

A HEDGE PLANT.

Many and divers are the claims put forth for certain hedge plants, in our leading journals—claims that seem ever doomed to but partial fulfillment. We do not say that there has been conscious misrepresenting—far from it; only that people will overlook the well-balanced, useful characters and take up violently with striking qualities and weak points. It is hence that we find the nurseryman disappointing customers by commending varieties intrinsically very beautiful and useful, but always, owing to one or more fatal traits, liable to failure. Just about this time begins to dawn on his mind the fact that a less beautiful, long-known variety suits better the public need. If he can unseat old prejudices, he will probably find that such popularity rests on a better-adjusted balance of qualities in the plant in question, with less falling off into positive and fatal weaknesses.

We do not propose, however, to discuss the various hedge plants viewed under this light, but merely to call, for a few moments, the attention to an old, long-used shrub that has hardly received due credit, the California Privet.

Most of the Privets, although much valued and employed in Europe, are liable to blight and disease in this country, especially when frequently and severely pruned. The California Privet is happily free from such tendencies. It is extremely vigorous, readily propagated, and quite hardy, and, with its shining, lively green, presents throughout the season a most refreshing appearance. The leaves are small, erect on the stem, with a decided, waxy luster, and the firm, woody stem resists all accidents and stress of weather. To its American origin may be attributed, probably, its freedom from blight, for certainly a cleaner, healthier growth can hardly be conceived. Planted two to three feet apart, it soon makes a strong, compact barrier, only less impervious than a Thorn hedge, and, in its own way, as ornamental as any. Its vigor and closeness of habit render it when pruned, specially fitted to cover fences and other unsightly objects.

Just here it may be well to say a word on this important item of pruning. The California Privet is accused of lapsing into nakedness near the base, and losing thereby both symmetry and usefulness. This is a serious difficulty, but an intelligent use of the pruning-knife removes all such objection. Coincident with setting out, the plant should be cut back to about one foot or more, according to strength, and then allowed to grow for two years untouched, attaining, perhaps, a hight of four feet. At the expiration of that time, one-half the growth just made should be removed, when a strong, thick mass will accumulate below, succeeded (if left untouched, as it should be) by a corresponding growth of the top in the following year. This process may be repeated during another two years, if still greater hight be desired, with always the result of a perfectly-furnished, well-developed hedge. To retain this perfection, however, for a greater length of time after the desired hight is attained, all wood made during the previous two years should be removed just below the commencement of these two seasons' growth.

This system, with modifications, will be found to accomplish the object desired with all hedges, whether evergreen or deciduous. It is only by cutting back into the old wood every two years that a well-balanced growth of both top and base can be obtained, for base and top will not grow equally both years. It must be first the base and then the top.

Nothing can be more beautiful than the California Privet treated in this way, and it is only a wonder that, known as it has been through so many years, some one has not undertaken to trumpet its merits as the hedge plant *par excellence*. Perfect it is not, for, like all vigorous deciduous shrubs, it is liable occasionally to winter-kill, on low ground, in its tops of imperfectly-ripened wood, but in making up a list of practical, ornamental hedge plants, it must always take rank among the best.

Samuel Parsons, Jr.

TREE NOVELTIES.

Evergreens are mainly prized for their green foliage during winter. How, in the rage for variegated plants our tastes may be changed or perverted, is shown in the following, copied from the London Field:

The Golden Scotch Fir.—A Scotch Fir, the leaves of which turn yellow in winter and become of the normal green in summer. This kind of variegation is also not likely to dwarf the tree or destroy any of its parts—unlike the total and constant blanching of parts of Conifers, which generally results in the death of the said parts. Another variety of the same trees has the tip of each leaf of a silvery hue; it is called *argentea variegata*. This variegation also comes on in winter, and then every leaf has its silvery tip.

Taxus Baccata Washingtoniana.—The Washington Yew, is of a golden color and thought to be the best of the "Golden Yews," because of its strong growth and as it does not suffer from very bright sunshine in summer. It is different in hue from the old Golden Yew, being of a fine, bronzy gold. Newer than this is *Taxus adpressa variegata*, which is a constantly variegated form of *T. adpressa*, having a golden suffusion of color.

Alnus Glutinosa Aurea.—This is one of the most constant of the golden-leaved deciduous trees. When planted in a moist position and fully exposed to the sun, the color is very fine.

THE NURSERYMAN'S OCCUPATION GONE.

In the *Wiener Landwirthschafflichen Zeitung* a certain Mr. William Ossenkop offers for the sum of 6s. a treatise on a New Mode of Propagation of trees and shrubs, discovered by him and practiced for some twenty-four years. The instructions are accompanied by thirty-two illustrations. According to the author, who says he is supported by the testimony of Dr. Fenzl and other well-known men, trees, shrubs, and other plants may be increased by his method at an extraordinary rate and in an incredibly short space of time. Apples, Pears, Cherries Peaches, Apricots, Currants, Gooseberries, Vines, and all kinds of ornamental and forest trees, are easily propagated on their own roots, and the nurseryman and gardener no longer need trouble to raise stocks, for in one year it is possible to obtain good trees on their own roots. To plant a vineyard it is only necessary to have a few canes of the sorts needed, and the rest is speedily accomplished. To the flower-gardener this wonderful system is of inestimable value; in short, no gardener ought to remain ignorant of it. Mr. Ossenkop concludes with the assertion that "his method is no swindle, but based upon natural laws; it is the simplest thing in the world—the egg of Columbus!"

The Gardener's Chronicle of England thinks it very honorable of Mr. Ossenkop to give it twenty-four years trial, before offering it to the public. (!)

The Vineyard.

GRAPE SIRUPS.

This is another product likely to become of some importance if grapes continue to be produced in such vast quantities as they are at the present time. California Vineyardists are especially interested in finding a ready market for the products of their vineyards, and as the entire crop cannot be disposed of in its natural state, and all the varieties cultivated do not make first-rate raisins, the production of Grape Sirups, opens a new source for the disposal of any surplus stock. The Pacific Rural Press in speaking of this new industry says:

So far as we know the manufacture of grape sirup has reached the most systematic development at St. Helena, Napa county, at the establishment of J. C. Weinberger. We have, in former issues, noted the fitting up of his manufactory. A full answer to the query of our correspondent above may be found in the following interesting description, which we take from the last week's St. Helena Star: Mission grapes, let us premise, are the kind to be used; not only because they are worth less than other kinds for wine making, but are worth more for sirup—containing a greater quantity of saccharine matter.

The process is as follows: Juice from Mission grapes is expressed in the ordinary way, a ton yielding about 120 gallons fit for sirup-making. After the grapes have been through the crusher, the juice is drained off, all that will run freely, when the pumice is thrown in a press-tub, and all the juice that will run white pressed out—about a couple of hours pressing will accomplish this. When the juice begins to be colored it should no longer be used, and all the rest of the pumice may be thrown back into tanks and fermented for common wine, or sent to the still, or fed to hogs, for which latter purpose it is very good. The juice when ready should, before it undergoes any fermenting process—that is within a day—be placed in what is called a clarifying tank, holding not less than 150 to 200 gallons, and made of planished (tinned) copper. The copper is to enable it to be heated, and the tinning to keep the acid of the juice when cooled from forming verdigris. This clarifying tank is over a fire, and the juice is heated up just enough to bring it to a boil. Just before this point a process is gone through to neutralize the acid and separate the albumen contained in the juice. This consists of the use of lime. For a quantity of, say 120 gallons of juice, take three pounds of unslacked lime, slacken with enough water (say a gallon) to make it into a thick paste. Then take part of the hot juice and stir it up with this lime, when, being reduced to a very thin state, pour it into the clarifying pan, (keeping back the sediment naturally resulting from the lime slacking) and stir it all up well. The effect of this will be instantly seen by a separation of the albumen from the juice, the former floating round in little particles like the curding of milk, and becoming of a muddy color.

The acid in the juice is by the same process also neutralized, and becomes sweet. The juice being brought to a boil, the fire should now be reduced, and the juice may be either left in the clarifying pan to cool off and settle, or transferred to other tanks for the same purpose. Within about six hours it will have settled, and the evaporation or sirup boiling may be commenced. For sirup boiling various contrivances may be used. The best Mr. W. considers Cook's patent evaporator, which is the one used by him. The pan is a shallow affair, some four inches deep and about nine feet long by four wide; across this run partitions, dividing it into 18 compartments, or troughs, and these partitions being alternately closed at one end and open at the other, make a continuous trough-like affair, through which the juice gradually flows from one side to the other, working slowly down in this way from the upper to the lower end of the pan, the evaporating process meanwhile, by the aid of a moderate fire underneath, gradually going on, so that by the time the juice, which has entered at the upper end, gets to the lower end, it is reduced to sirup and is drained off into vessels below. For the purpose of keeping up the flow, the pan is made on rockers, so that the fall may be regulated to suit the sirup maker, (large pans are made on brick arches, with the incline already adjusted). The juice is fed into the evaporator from a tank at the head, whence it runs through a faucet in a continuous stream. As to the time consumed in evaporating, 250 gallons of juice can be readily put through in 12 hours. Three gallons of juice make one of sirup, providing the juice contains 25 per cent of sugar, which is the minimum degree at which it ought to be made; the higher the better. This is about all, except the cooling off of the sirup, which ought to be done before putting in barrels. For this purpose a large iron pan, holding about 60 gallons, is used,

PROTECTING GRAPE VINES.

There is scarcely a single variety of Grape of good quality in cultivation, where the thermometer falls beyond 12° below zero, that can withstand our winters without protection. An easy method of protecting them is (after the vines are pruned) to tie them in a compact manner with twine, then lay them down upon the ground, and by means of stakes secure them in position, and then cover them about two inches deep with earth. Refuse hay or straw will do very well for this purpose, but sometimes mice get into such covering and gnaw the bark off the vines. In clayey soils, and where but little snow falls, straw or hay would be the best covering, because the rains of winter, upon a soil tenacious of moisture, often kill the buds, by keeping them too wet.

The question may arise, "In what latitude would it be safe to leave the vines upon the trellises during winter?" They may generally be left with safety in the latitude of New Jersey and further south; but even in parts of that State the Concords were all killed in the winter of 1872.

We advise such of our grape-growing readers as have omitted to prune their vines to do so without delay, as November is the most suitable time to do it. If you desire to propagate vines from cuttings, cut them in lengths of from two to four buds, according to the length of the joints of the cane. They ought to be sunk to the depth of from six to ten inches into the soil when set out. Select good, well-matured wood of this year's growth, cut off close to the lower bud and an inch or two above the upper one; and they may be preserved during the winter by placing them in the ground, closely packed, with the upper buds just above the surface, then lightly cover them with straw and set them out in the spring.

The Apiarian.

DO BEES GATHER HONEY OR MAKE IT?

Prof. Chas. V. Riley, State Entomologist of Missouri, appears to have awakened quite an excitement among bee-keepers by propounding the above question.

The discussion of it has not been limited to America, for no "pent-up Utica" can keep within its confines so momentuous a theme as the origin of honey, consequently it has crossed the Atlantic and our English cousins appear to be greatly excited over what they consider a question propounded by a Yankee. But as it happens, Prof. Riley is by birth an Englishman, although we now claim him as a loyal American citizen, and believe that he is abundantly able to "strike back" when he receives a blow from friends at home or abroad.

The Professor, it appears favors the opinion that bees "make" honey out of the saccharine material gathered, and Mr. Pettigrew, a well-known apiarian of England favors this view, and has so expressed himself in the Journal of Horticulture. This has brought out some very sarcastic replies one of which we copy to show our readers how the "honey war" rages abroad.

My simple answer to this question, which has been again brought to the front in this Journal, is that the latter is an impossibility. Unless bees bring sugar into their hives apart from the substance which Mr. Pettigrew calls crude honey, or excrete it from their own bodies, they gather it abroad from fruit or flowers, or in rare instances in the form of honeydew. Mr. Pettigrew's notion is that bees excrete it from their own bodies, and in support of his opinion he quotes the statement of a certain Professor Riley, an American, by whom the truth is so well told that Mr. Pettigrew ventures to repeat it in two successive issues of this Journal. "Honey," he says, "is a secretion of bees to some extent as well as wax." But presently he says that the "crude honey found in flowers and gathered by the bees is afterwards changed and converted into honey proper. After having been gathered and disgorged it is reswallowed, and then passes through a process of preservation, in which it is thickened and sweetened, resulting in honey, as the Professor puts it." With all respect to Mr. Pettigrew I must say, as I have said before, that these random and curious assertions are not proven, and therefore the truth of this presumed fact is still lying in dreamland.

It is singular to observe how ready Mr. Pettigrew is to endorse the notions and statements of this American gentleman, happening as they do to coincide with his opinions, whereas a while ago, in respect to the value of Italian bees, the testimony of a number of Americans was ridiculed and contemned by him, in common with everything from America, in the most unmeasured terms. I repeat, with all respect both for Mr. Pettigrew and his American friend Prof. Riley, that we have as yet nothing but bare assertion for all these curious statements. True, there is an allusion to a certain other American, a "chemist and botanist of Louisiana, who described the changes undergone by nectar in the elaboration into honey in the bee's stomach." Now this is just what we want to know. Will Mr. Pettigrew favor us with the data upon which this chemist founded his argument? Doubtless the same authority which notified the fact to the "Housekeepers' Convention in St. Louis," also contains the details of this remarkable discovery, which certainly was new to the Journal of Horticulture till it was mooted by Mr. Pettigrew. I can imagine no more interesting subject to bee-keepers, on which the patient and exhaustive mind of the scientific President of the British Bee-keepers' Association, Sir John Lubbock, might be brought to bear, than this question of the presumed manufacture of honey in the stomach of the bee, if indeed he should think it worth a second thought. At present I say we have nothing but statements and assertions in support of the theory, which without the most satisfactory proofs will remain assertions and nothing more, however frequently and persistently reiterated.

The secretion of wax from honey is an entirely different thing, for honey is known to be little more than the quintessence of sugar, which contains the fatty elements which are the ingredients of wax. But where does the sugar come from? Mr. Pettigrew says it is not found in the crude honey gathered in the flowers, it is elaborated in the stomach of the bee. Is it so? Prove it, I say. It must, however, be elaborated out of something in the stomach of the bee. For "out of nothing comes nothing." Now, Mr. Pettigrew, please to tell us what is that something out of which bees make honey; but in the name of everything that is scientific, do not repeat the same tale in the same form. Till the proof positive is furnished, or at least till reasonable grounds for believing such a very extraordinary thing are supplied us, nobody will be convinced whose opinion is worth a groat.

Of course, we all know very well from our first practical experience of honey, that at first, especially at certain seasons, particularly towards the close of the honey season, it is thin and watery. You may call this crude honey if you like. I do not object to the term. Also, of course, we all know that bees transport the honey from cell to cell. At first they put it into any vacant cell which happens to be ready for it. At night, or on wet or gloomy days, it is carried away if there be a good quantity of it in the cells usually appropriated to the queen's use for breeding purposes, and removed to the permanent honey stores wherever these may be. In process of transfer the bees reswallow it and disgorge it. All this we know well. I for one believe (and it is at least a reasonable belief), that owing to the heat of the hive a great evaporation takes place in the honey, both when deposited temporarily and when transferred, and that it thickens, and, of course, becomes sweeter and richer in the process of thickening. But do not tell me that the bees have a conjuring power hidden somewhere in their diminutive honey sacs, which are scarcely larger than a big pin's head—a power to convert the watery sugarless juice (according to Mr. Pettigrew), extracted from flowers into real honey by means of the sugar latent in the said tiny sacs.

Now for a bit of real "fact." A friend of mine, who is such an enthusiastic bee-keeper that he can never let bees alone wherever he finds them, tells me that about seven weeks ago, happening to be visiting a lady in Staffordshire who keeps bees, he offered to take her honey for her. This was done, and on carefully examining the combs, which were rich in honey in open cells among the brood as well as in the upper stores of the hive, he could see no difference in the honey. What was in the open cells was just as rich and as perfect honey as that which was sealed-up. He pointed out the circumstance to his hostess in special reference to Mr. Pettigrew's theory, with which he was well acquainted. Now, I do not mean to say that this uniform richness is to be found under all circumstances and in every season alike the same. I know it to be otherwise. But in this instance the bees were still hard at work bringing honey into the hive; and it is a proof of the remarkable productiveness of the season, that quite to the last the honey was as rich or nearly so as it had been at the beginning.

There was no crude honey in the hive at all. Can Mr. Pettigrew account for this on his theory? Usually the case is very different. In this country, at least, our honey is uniformly thick and very rich in May. It is gathered from the April and May fruit blossoms, especially from the apple blossoms. In June that gathered from the early white clover is still rich, though paler than that gathered earlier. In the latter part of July and early August it is often very thin and poor with an acrid flavor; and at this time, when the honey harvest usually takes place, there will be found all the difference which Mr. Pettigrew describes between his crude syrup in the open cells and the richer honey stored in the upper part of the hive.

Scientific and Useful.

THE GERM THEORY OF DISEASE.

Scientists are continually pushing their investigations deeper and deeper into the secreted recesses of nature in search of the cause of various diseases the origin of which has so long remained a mystery to man. The more thorough their investigations the more apparent it becomes that nearly all diseases of animals, and plants, arise from some kind of a parasite. These may belong to the animal or vegetable kingdom, but in a majority of instances they are so minute that it is difficult to learn much of their nature or the conditions under which they develope and multiply.

It has long been held by some of our scientists that fevers of various kinds are caused by the presence of some minute parasitic fungus, which has been absorbed by the system either from the air or food. Fever and ague is probably caused by one species, typhoid fever by another, and yellow fever by still another, and so on through the entire list of diseases to which human flesh is subject.

We notice that this fungoid theory of the origin of diseases is gaining ground rapidly among our best thinkers, and most scientific investigators, and although it is not what might be termed a new theory, still the means for determining its accuracy were so limited in former times that it is only of late years scientists have been enabled to make any positive progress in producing cogent facts and data bearing upon the affirmative side of this question.

We notice that Prof. Tyndall, in opening the winter course of popular scientific lectures in Glasgow selected this germ theory of epidemic disease for his opening discourse. He stated that two hundred years ago, Robert Boyle wrote in his essay on the Pathological Part of Physic, "that he that thoroughly understands the nature of ferments and fermentations shall probably be much better able than he that ignores them to give a fair account of divers phenomena of several diseases (as well fevers as others) which will, perhaps, be never properly understood without an insight into the doctrine of fermentations." But it was only in this our day that men were beginning to realize the truth of these pregnant words.

In the domain of surgery, Professor Lister of Edinburgh, had demonstrated in his antiseptic treatment that the putrefaction of wounds was to be averted by the destruction of bactria. Passing from surgery to the domain of medicine, he said the conviction was spreading and growing daily in strength, that reproductive parasitic life was at the root of epidemic disease—that living ferments finding lodgment in the body increased there and multiplied, directly ruining the tissue on which they subsisted, or destroying life indirectly by the generation of poisonous compounds within the body. This conclusion, which came to us with a presumption almost amounting to demonstration, had been clinched by the fact that virulently infective diseases had been discovered with which living organisms were as closely and as indissolubly connected as the growth of torula was with the fermentation of beer. And here he wished to utter a warning to well-meaning people.

We had now reached a phase of this question when it was of the very last importance that light should once for all be thrown upon the manner in which contagious and infectious diseases take root and spread. To this end the action of various ferments upon the organs and tissues of the living body must be studied, the habit of each special organism concerned in the production of each specific disease must be determined, and the mode by which its germs are spread abroad as sources of further infection. It was only by such rigidly accurate inquiries that we could obtain final and complete mastery over these destroyers. Hence, while abhorring cruelty of all kinds, while shrinking sympathetically from all animal suffering—suffering which his own pursuits never called upon him to inflict, an unbiased survey of the field of research now opening out before the physiologist caused him to conclude that no greater calamity could befall the human race than the stoppage of experimental inquiry in this direction.

A lady whose philanthropy had rendered her illustrious, said to him some time ago that science was becoming immoral; that the researches of the past, unlike those of the present were carried on without cruelty. He replied to her that the science of Kepler and Newton, to which she referred, dealt with the laws and phenomena of inorganic matter, but that one great advance made by modern science was in the direction of biology or the science of life, and that in this new direction scientific inquiry, though at the outset pursued at the cost of some temporary suffering, would in the end prove a thousand times more beneficent than it had hitherto been. It was exceedingly important that such assemblies as that which he was addressing should see clearly the issues at stake in such questions as this, and that the properly informed common sense of the community should temper, if not restrain, the rashness of those who, meaning to be tender, would virtually enact the most hideous cruelty by the imposition of short-sighted restrictions upon physiological investigation. It was a modern instance of zeal for God, but not according to knowledge, the excesses of which zeal an instructed public opinion must correct.

Floricultural.

PLANT FERTILIZATION.—LOBELIA SYPHILITICA.

The way in which plants are fertilized is at present, more than ever before, a subject of general interest, and it is one from which every admirer of flowers, whether a botanist or not, may derive instruction. Many flowers may or do fertilize themselves. Many depend upon the wind to carry the pollen from the male to the female. Others are wholly dependent, it would seem, upon insects for their fertilization, and among this last class we propose to speak of *Lobelias*, selecting *L. syphilitica* for illustration. This is the blue or purple Cardinal Flower that appears to prefer moist, half-shady places, and may be found in the fresh water marshes bordering rivers and streamlets. The petal-like filaments of the stamens, though separate below, are coherent above, and with their anthers form a slender tube, the anthers looking inward. The pistil in the bud is quite short, lengthening as the bud unfolds, until finally the stigma has made its way through this tube for the distance, it may be, of an eighth of an inch or more, much the same as if one should push his finger through the finger of a glove with the end cut off, the end of the finger representing the stigma, the rest of the finger the style, and the shortened glove-finger the tube of the united filaments and anthers. Now, the anthers mature and burst at the same time, or a little before the stigma of the elongating style reaches them, filling the little, round cavity (the sides of which are the united anthers, and the bottom of which is the closely-fitting stigma) with pollen. The elevation of the stigma by the continued growth of the style presses upon this pollen, causing it to ooze out at the top of the tube, the same as water would issue from the top of a syringe if the piston-rod were very gently pressed. If flour could be substituted in the syringe for water, the analogy would be closer. It would appear, therefore, that inasmuch as the pollen of every flower rests upon the stigma for a considerable time (from twelve to forty-eight hours), the ovules are necessarily impregnated by the pollen of the anthers of the same flower. Indeed, if our observations were to cease at this stage, we could arrive at no other conclusion.

After watching the flowers of *Lobelia syphilitica* as long as our patience could be coaxed to hold out every day for a week or so, and not seeing a single insect upon any one of the one hundred flowers before us, we should ourselves have concluded that they must be self-fertilizing, were it not for the fact that the stigmas, so far as we could judge, were never ripened or fit for the reception of the pollen until they had passed through and beyond the coherent anthers. In a neighboring field and along the banks of a lively stream, we happened one day upon a plantation of this *Lobelia*, consisting of scores of plants in every stage of bloom, and here we were not obliged to wait long for a full understanding of what we had wasted many hours over in our own garden.

Let us now note that the corolla consists of two lips, the posterior (upper) having two erect lobes, the lower recurved and more spreading. As soon as the pollen bursts the cells of the anthers, the pistil begins to recurve toward the lower lip, somewhat as a fish-hook is curved, though less, so that the top of the stamen tube almost rests upon the lower lobes of the corolla. It is just here that a bee or other insect would naturally light in order to procure the honey secretions within.

A big bumble-bee was the first visitor, and indeed the only one whose behavior we need record. Forcing his head and thorax beneath the crooked end of the staminate tube or pistil, if the latter had yet sufficiently protruded, and between it and the lower lip of the corolla, the tip of the tube or stigma, as may be, pressing upon the middle of the thorax would part the hairs to the right and left the same as the hair of one's head is parted with a comb.

When the bee selected flowers in that stage in which the pollen was being forced out of the tube, there was always a quantity on the outside adhering to that within. This, of course, would necessarily be deposited upon the thorax of the bee as he entered the flower, and, from its different color, marked the "part" so distinctly that it could be seen half-a-dozen feet away. When the bee, withdrawing from this flower, visited another, it was as likely as not to happen that all of the pollen had been forced through and out, and that the pistil, maturing afterward and having made its way through the tube, was ready to receive the pollen which was to creep down the style and to perform its part in the creation of embryos in the ovules of the ovary. This pollen was abundantly supplied to the ripened stigma by the "part" of the thorax of the bumble-bee.

The stigma, before maturity and while—from the growth of the style—it is slowly making its way through the tube of stamens, is surrounded with a fringe of short hairs. After the stigma has made its way through, it begins to swell and ripen. Two convex lobes are developed, and the fringe of hairs is now covered by these lobes and may be seen underneath. Had the stigma matured while still within the tube, its increasing size would have split the anther tube, and thus no cross-fertilization could occur, since the stigmas, ripened within the tube, could alone come in contact with pollen of the same flower. The fringe of short hairs, it may be supposed, acts to rid the anthers of every grain of pollen, for, though we divided lengthwise in two perhaps twenty tubes after the stigmas had passed through them, not a grain of pollen was visible.

In several instances, the stigma was caught or held in the anther tube. The style, continuing to grow, thrust itself between and outside of the filaments, where the latter were not united, in the shape of a bow. One of these which we marked did not perfect seeds, which, so far as it goes, is evidence either that the stigma did not mature when thus confined, or that the pollen is not potent upon the stigma of the same flower.

TUBEROSE CULTURE IN GEORGIA.

I see an invitation, in the last number of the Rural, to "Rural Floriculturists" to write about some favorite plant with which they have had pleasant experience and success during the season just past. Now, I think this a grand idea, and I hope that all the old and young male and female Ruralists will avail themselves of this broad invitation. For myself, I have so many pets in the Floral family, I am at a loss about which one to begin my gossip. Perhaps my Tuberoses will interest as many of the lovers of flowers as any other plant that comes under the care of any of the Rural family.

Early in the year, in a January number of the Rural, our much-admired friend, "Daily Rural Life," called attention to the fact that in the Southern States was the best climate for the successful cultivation of Tuberose bulbs and asked Southern Ruralists to try the experiment, as the continued length of our summer seasons would give longer time for the full growth and development of their flowering qualities. Having followed a great many of the suggestions thrown out by that able and sometimes caustic writer, and finding them always practical and successful, I concluded to try this one, and accordingly laid off one-quarter of an acre in one corner of my grounds, where the soil was a stiff clay, made light and friable by the addition of well-rotted manure, and where there was a bright, sunny exposure facing the east. I had the soil spaded up about twelve inches deep, well pulverized, and laid off in rows about eighteen inches apart and about four inches deep. It was then ready for planting. I had taken up my Tuberoses last winter and stored them under the bench of my greenhouse, where they kept very well. I took them out and pulled off all the little offsets and bulblets, until I had entirely stripped the main bulb of all its incumbrances. I then had three classes of bulbs ready for planting—the main or center bulbs being large enough to bloom this season; the second size being such as would make fine, large bulbs for flowering the next season, and the third size being very small, some not much larger than large grains of corn, and which would take two years to bring them into flowering bulbs.

I planted the large size first, about four inches deep, and covered them firmly in the soil; the second size about three inches deep, and the third size about one and a-half inches deep. The planting was done on the 10th of April, which is about the time we commence to plant cotton in this climate. I cultivated them as I would onions, with hoe and rake. About the 10th of August the large-sized bulbs were in full bloom, and had the largest and most thrifty-looking flower-stalks I ever saw. The second size grew well, but have not bloomed. A few, however, have started flower-stalks, and I have had them taken up and potted for winter-flowering in the greenhouse. The smallest size have grown vigorously, and now look as if they would make good flowering bulbs for another year. We have not yet had sufficient frost to kill the tops down to the ground; I have not yet, therefore, taken them up to see, but think I will have enough Tuberoses to plant all my ground next year and also have a few to spare for those who have not succeeded so well.

I think that your idea of the South being the most suitable place for the cultivation of Tuberose bulbs is fully verified in my experience this year. I would be glad to hear from any others who may have caught the same idea last spring and tried to carry it out. J. G. R.

Griffin, Ga.

MISCELLANEA.

Let me give the Rural readers, who chance not to be possessed of it already, a little information that I obtained some years ago; and if plants happen to be scarce, as was the case with me, it may prove convenient to put it in practice. When at the end of summer you are cutting down your Snap-dragons, save the trimmings and pot them singly in small pots: keep them away from the frost and do not allow the soil to get dry. When warm weather again comes you will find them all rooted and growing nicely. They will not make large plants, but they will blossom beautifully all summer, and, when set pretty closely together in a bed, are quite satisfactory-looking, I think. M. W.

Paquonoc Bridge.

Entomological.

ENEMIES OF THE HICKORY.

Few persons who have never had occasion to study that branch of Entomology known as "Coleopterology" would imagine that our common Hickories are infested by at least a score of insect enemies, the most destructive of which belong to the order of Coleoptera, or what are more generally termed Beetles.

Hickories, as seen in the forests, are quite healthy and apparently free from insect depredators, still the entomologist can usually find evidence of the presence of enemies, even where the trees appear to the inexperienced eye to be most vigorous and healthy. Many a branch or twig will be found completely girdled and dead, and this marks the presence of what is known as the Twig-girdler (*Oncideres cingulatus*—Say), a very pretty "long-horn" beetle, nearly an inch in length and of a grayish color, with a broad, brownish band across the anterior portion of the wing-covers, technically termed the "elytra."

The female beetles only girdle the twigs of the trees, and they do not confine their depredations to the Hickories, but frequently invade Apple-orchards, doing considerable damage by causing the death of many a branch which the orchardist can ill afford to spare. In girdling a branch this beetle cuts a narrow groove entirely around it, through the bark and into the softer outer layers of wood, thus preventing any further circulation of the sap, and all above the incision soon dies.

For a long time after this insect was known to entomologists the object of the girdling remained a mystery, but at last it was discovered that before the female makes the incision, or during the time she may rest from her labors while performing the operation, she deposits several eggs upon the bark above. These eggs hatch, and the young grubs immediately penetrate into the center of the twig. It appears from this that instinct teaches the female beetle that the young grubs require soft, green bark and wood during the early stages of their existence and hard and dry wood when they become older, consequently the eggs are laid upon the green branches during the month of August, and she then proceeds to girdle the twig in order to furnish her progeny with dead wood in September and the months following. Many of these girdled twigs are broken off by the winds of autumn, especially where the trees are much exposed; but this seldom occurs with trees in the woods. Hence we must conclude that the breaking and falling of twigs are more in the nature of an accident than by design on the part of this insect, as has been claimed by some writers.

The depredations of this beetle amount to but little, however, while it confines itself to the large Hickory or other trees in the forests, for the loss of a few terminal twigs of the side branches is of small account, but when these insects are abundant in the Apple-orchards and when they attack the terminal shoots of young Hickories in the nurseries or on plantations where they are cultivated for hoop-poles, it becomes a matter of considerable importance. The best method we know of for checking the multiplication of this insect is to gather, during the fall and winter, all the girdled and dead twigs containing the larvæ and burn them, with their contents.

Another pest of the Hickory, and belonging to the same order and family as the Twig-girdler, is the Pointed Clytus (*Cyllene pictus*—Drury). This beautiful beetle very closely resembles the common Locust-tree borer (*C. robiniæ*), but it appears in early spring, while the latter is found only late in summer or in early autumn. This Hickory borer prefers half-dead trees to those which are growing vigorously, and a Hickory wood-pile is its delight, especially one made from live trees the previous winter.

We have seen cords of Hickory completely honey-combed by the larvæ of this beetle in a few months, thereby greatly lessening the value of the wood. If asked how best to check the increase of this insect, we should be at a loss to suggest a preventive beyond that of encouraging the presence of insectivorous birds of large size, especially the Woodpecker and the Crow.

Destructive as are the two species of beetle we have mentioned, there is another which bids fair to become the chief among the foes of the Hickories in general, for it attacks all the species alike, not sparing either old or young. We refer to the Four-spined Scolytus (*S. 4-spinosus* of Say). This is a very small beetle, less than a quarter of an inch long and about one-sixteenth of an inch in diameter. The males have four minute spines on the posterior joints of the abdomen. Hence the name, *4-spinosus*. These beetles bore through the bark of the trees, making a very small hole, scarcely observable to a person not accustomed to looking for such enemies; but when once inside the bark, the work of destruction performed by this insect goes on quite rapidly. The female makes a shallow, perpendicular cavity, half its depth in the soft wood and the other half in the inner bark, and altogether about one inch in length. Along each side of this burrow she deposits her eggs, about as near together as they can be conveniently placed. So soon as the eggs hatch, the young grubs move outward at right angles from the central burrow, feeding upon the soft, alburnous matter between the bark and wood, thereby cutting off the downward flow of sap and, when numerous enough, as effectually girdling the tree as our Twig-girdler does the smallest branch.

Not long since we cut down a Hickory which was infested by this pest, and we can say without exaggeration that there were millions of these grubs under the bark. Of course it would be next to an impossibility to apply any preventive to the bark of large trees, and perhaps not at all practicable to do so to small ones, consequently we must look to the birds for relief from this pest, which is becoming so fearfully abundandant all through the Northern States that Hickory groves, situated at some distance from large forests, and where birds are not plentiful are in great danger of being destroyed by this minute pest.

THE PINE SAW-FLY.

Evergreen trees are usually quite free from insect depredators, especially when the trees are young and growing in nurseries or ornamental grounds. Occasionally, however, insect pests appear, and if they are not vigorously assailed they will do an immense amount of injury in a very brief period of time.

The Pines are especially liable to the attacks of several species of the Saw-fly, and so rapidly do they work that a few days will suffice to denude a large tree of its foliage. One of the most common of these Saw-flies is the *Lophyrus Abbotii*—Leach, and it seems to prefer the large and coarse-leaved kinds, such as the Austrian and Pitch Pines, to the White and other more delicate species.

The flies are about half an inch long, the male a jet black and the female a honey yellow, with pale yellow legs. They appear in June and deposit their eggs upon the leaves of the trees which are to furnish the larvæ with food. The grubs, when fully grown, are nearly an inch long and of a dirty yellow color, ornamented with numerous black marks along the sides. They are quite social in their habits, crowding together upon the branches and fairly covering the leaves while feeding. When once they attack a branch, they do not leave it until every leaf is devoured, and then they pass on to the next.

Our entomological authorities state that there is but a single brood of this insect in a season. If this is true, then it is one of the longest-lived of our leaf-eating pests, for we have had them with us from June until late in November. It is one of the few larvæ which seem to be indifferent to either heat or cold.

We have already had some pretty hard frosts up to this date, Nov. 14, and yet a neighbor has just brought us some of these grubs taken from his Pine trees. For several years past we have noticed that these Saw-fly larvæ remained upon the trees till very late in the fall, and that it required a hard freeze to make them leave off feeding and descend to the earth, where they spin their cocoons among the old leaves and other vegetable matter.

The cocoons are about three-eighths of an inch long and one-eighth of an inch in diameter, and when first completed are of a pure, silky, white color, but soon become bronze, or brownish, by exposure. We have some cocoons before us now that were spun by worms which were kept for a few days in a box. They are of a snow-white color and do not show any indication of changing to the color of those which we have frequently gathered from under Evergreen trees.

These grubs, when found upon the trees, can be readily destroyed by applications of whale-oil, soap, tobacco water, or by dusting with caustic lime when the trees are wet with dew or rain. If their destruction is neglected one season, they are pretty certain to become very numerous and troublesome the next.

Domestic Economy.

LACE CURTAINS.

A CORRESPONDENT of the Inter-Ocean has a mode of doing up lace curtains which is very simple and easy :

First, shake the dust well out of the lace, then put in tepid water, in which a little soda has been dissolved, and wash at once with the hands in several waters, if necessary to make them free from dust and color. Then blue the rinsing water, and blue the boiled starch quite deeply, as the lace looks less blue when hung against the light. Then, having pinned down the sheets in a vacant, airy room, pin on the curtains very closely, stretched to exactly the size they were before being wet. In a few hours they will be dry and ready to put up again at the windows. The whole process of washing and pinning down should occupy as little time as possible, as lace will shrink more than any other cotton goods when long wet. Above all, it should not be allowed to "soak" from the mistaken idea that it washes more easily. Nor should it ever be ironed, as it looks quite fresh and new if properly dried.

After having the supervision of the washing and drying of seventy-five pairs of lace curtains for several years, we conceived a way by which the tedious labor of pinning the lace to the floor could be avoided. We ordered from the carpenter a set of frames very like the old-fashioned "quilting frames," thickly studded along the inside with the smallest size of galvanized tenter hooks in which to fasten the lace, with holes and wooden pins to vary the size to suit the different sizes of curtains. When lace curtains are to be washed they should be measured before being wet, and stretched in the frames to that size to prevent shrinking. It takes but a few moments to fasten the curtains, and five or six can be put in, one above another, and all dried at once. The frames can rest on four chairs. The cost of them was $4—the price of having one good pair done away from home—and made very tender, and even useless after a year or two. They have proved a great saving of labor and time, a thorough success, and we find them a most satisfactory aid in our system of domestic economy.

ORIGINAL RECIPES.

To Make a Rabbit Taste Like Hare.—Choose one that is of good size. Skin it, and lay it in a seasoning of black pepper and allspice, ground, a glass of Port Wine, the same quantity of vinegar, turn it over occasionally. Let it remain in the seasoning forty hours then take it out. Do not wash it, but stuff it and roast it as a hare.

To Fry Rabbits.—Cut them in joints, and fry them to a nice brown in butter; send them to the table with fried parsley or liver gravy.

Rabbits Stewed.—Take a couple of rabbits; divide them in quarters, flour them, and fry them in butter, then put them in a stew pan, with some good gravy, and a glass of white wine; season with pepper, salt, and a sprig of sweet herbs, cover them down close, and let them stew until tender; then take them up, strain off the sauce, thicken with flour and butter and pour it over them.

Celery Stewed Brown.—Cut the celery in small pieces, half boil and drain it. Then stew it in some good gravy, with a little red wine, pepper, salt, nutmeg and a little catsup. When tender, mix a little flour smooth in the gravy and boil it all up. Serve hot.

Cabbage and Sausages.—Cut the cabbage very thin, put it into the stew-pan with a small piece of ham, an ounce of butter at the bottom, half a pint of broth, and a little vinegar. Let it stew three hours. When it is tender add a little more broth, salt, pepper, and a tablespoonful of pounded sugar. Boil till the liquor is sufficiently wasted. Then put it into the dish and lay fried sausages on the top.

To Fry Sausage With Apples.—Take one pound of sausage, and a dozen apples, slice eight of the apples an eighth of an inch thick. Cut the other two in quarters. Fry them with the sausage a fine light-brown. Lay the sausage in the middle of the dish, and the apples round the outside. Garnish with the quartered apples. Serve with mashed potatoes.—MRS. E. J. K.

SELECTED RECIPES.

A Compote of Oranges.—Put a handful of loaf sugar to boil with a gill of water in a sauce-pan; when it boils add the rinds of three oranges minced finely or cut into very narrow strips. Let the whole boil five minutes, add a wine glass of brandy, and pour the sirup (hot) over half a dozen whole oranges, peeled and cored—or cut up in any form you like. The oranges should be left in a basin with the sirup till quite cold; and then piled up on a dish and served. They look and eat extremely nice.

Quick Doughnuts.—1 cup butter, 2 of sugar, 4 eggs, 1 cup sour milk, 1 teaspoonful or less of soda dissolved in hot water, 1 teaspoonful cinnamon, little nutmeg, flour to roll in pretty soft dough. Fry in hot lard.

Pickled Apples.—Three pounds of sugar, seven pounds of apples quartered and cored, one pint of vinegar. Steam the apples until a fork will go through them readily. Then make a sirup of the sugar and vinegar and pour over them while hot. Stick a clove or two in each quarter. Very nice.

Baked Cauliflower with Parmesan Cheese.—Take the green leaves from two large heads of cauliflower; cook the heads in salted water, with a small lump of butter; drain them; have ready a buttered baking-dish, spread in it a handful of grated cheese and fine crackers, season the cauliflower inside and outside pretty highly with salt, pepper and nutmeg; set the heads in the dish, and give them the form of a dome; in another sauce-pan have a pint of bechamel sauce; when boiling, mix with it the yolks of four eggs and two ounces of grated Parmesan cheese, work it to a firm consistency, boil a moment, spread that sauce over the cauliflower, and smooth with the blade of a knife; sprinkle over the top some mixed grated cheese and fine crackers, and small bits of butter; bake twenty minutes in a warm oven, and serve in the baking dish.

Oatmeal For Breakfast.—Take a pint of oatmeal mush, stir in two eggs well beaten, and a small piece of butter; put into a well-buttered shallow pan, and bake a nice brown. We sometimes have the mush left from tea, and this is a nice way to use it.

Hygienic Information.

CONCERNING SIMPLES.—No. 1.

A KNOWLEDGE of simples is not always simple knowledge, and it is well to have some idea of the possibilities of medicinal plants, as it is not an unusual experience to be at times, beyond the clutch of a friendly doctor. Besides, doctors do sometimes disagree, while as between one's self and one's mind there should exist the serenest and most perfect accord. Moreover, if one should effect a cure in one's own case, such ironical apostrophies as "physician heal thyself!" would, it can be plainly seen, have no sting.

In the Middle Ages doctors placed their sole reliance on simples, which may account for the fact that later, those who swallowed anything that was seizable came to be known a simple people!

The herb doctor, in those halcyon days was burdened with no very strong prejudices against the fair sex, hence old ladies took to "yarbs" very kindly, and in a short time quite monopolized the business.

The medicinal qualities of plants were mainly determined by their color, odor, and peculiarities of structure, which it seems idle to add, are not exactly infallible. By rigidly adhering to such rules, and not allowing for exceptions, the system in time came to grief, and it was not until men trained in botanical pursuits again agitated the value of herbs as remedies, that simples regained their hold on the confidence of the ailing.

For example, charlatans insisted, notwithstanding the evidence of their eyes, that mandrake roots closely resembled the human form divine, hence, nothing was more natural than to claim for them great potency in all the ills that barbaric flesh was heir to. For the same reason saxifrage (break-stone) was thought to be a specific for gravel complaints; wallwort, because it grew among rocks, must certainly be anticalculus; the lung-wort with its velvety leaves and white spots was a "dead shot" in pulmonary troubles; the spear-wort, on account of the likeness between its roots, and tubercles, was thought to be excellent for hemorrhoids.

The bite of mad dogs was sure to be neutralized by a certain kind of plantain, and jaundice found a specific in a plant as yellow as the appearance of the disease.

Blood-wort was certainly created as a specific for blood-spitting, or why, they argued, should it be red! Superstition played her part by attributing to the agency of the devil the peculiar severed appearance of certain roots, which were deemed of great curative importance, because forsooth, his majesty wished to destroy a plant that prolonged life!

Euphrasia (eye-bright) was, and I believe is, considered good for sore eyes; is even of service in cases of cataract. Our ancestors thought so because they saw a resemblance between its flowers and the eye.

Examples such as these could be strung out indefinitely, but I have cited enough to show that medicinal plants were adopted and used for very funny reasons, and yet some of the plants mentioned are good for just the maladies indicated. It remained for others to determine precisely why. C. H. E. R.

HEALTH AT THE "CENTENNIAL."

IN your issue of Nov. 4th, you referred—and very properly—to the report of Medical Director PEPPER of the Centennial Commission. I have been an exhibitor at the Centennial Exhibition, and have been there during the entire exhibition when my health would permit. My business and business interests are principally in Philadelphia, and I reside near the city, therefore have no possible motive to misrepresent so important a matter as health. The scattered character of the city is conducive to good health. Agricultural visitors noted the "scattered" character of the exhibition. Although the exhibition buildings seemed well devised and stood upon comparatively high ground, they, in some way, contained prolific germs of disease, and a fearful proportion of the exhibitors and visitors suffered severe sickness in consequence, and numerous cases known to the writer terminated fatally. The writer was most of the time in Machinery Hall, the exhibitors of which were perhaps rather more closely confined than those of the other buildings. The floor of this building was laid directly upon the ground, and was very damp during the entire exhibition. I saw portions of the floor, in different parts of the building, taken up during different stages of the exhibition, and, in every instance, the ground was very damp—in some cases actually muddy.

Since the close of the Exhibition, the floors have been removed from over the railroad tracks, which traverse the building lengthwise, and I noticed long puddles of filthy water standing between the tracks now exposed. These puddles have a greenish-yellow scum upon their surface. It is, perhaps, unnecessary for the thousands of Centennial sufferers to look further for the cause of their sickness. A large majority of exhibitors or attendants in Machinery Hall *were* sufferers, and among them

WACAUTAH.

PHYSIOLOGICAL EFFECTS OF QUINIA.

DR. E. L. DRAKE, of Fayetteville, Tenn., has published in the Med. and Surg. Reporter, some of his experience and conclusions respecting the physiological action of quinia.

He says, at least three different physiological effects can be obtained from this drug. In doses up to two grains it is a tonic; from this to five grains it is a stimulant, and from that to ten grains or more it is a diaphoretic relaxant and calmative—a febrifuge. The amount of twenty-four grains distributed over twenty-four hours may have some anti-periodic effect in a mild type of ague, but will prove very disagreable to the patient, on account of cinchonism. If he has any headache, it will aggravate this symptom. If this amount be divided into three doses and taken within four hours, at any time after a pyrexia has reached its height, say after 4 P. M., the toxic effect will be apparent in the relaxation and diaphoresis; the patient will be drunk. A half pint of whiskey can be taken in small doses during a day without inducing intoxication; yet, if it is all taken in the course of two or three hours the individual will be apt to exhibit strong evidence of being in this state. So with chloroform and ether.

I make it a rule never to give quinine in the forenoon, always giving it at night, to the amount of not less than twenty-five grains, conjoined with an opiate, and am nearly certain of getting a good diaphoretic effect, which will be apt to extend through the succeeding day. In all the pyrexia of this region I prescribe it the first visit, and frequently have the satisfaction of aborting a case of pneumonia, or making its subsequent course manageable. In the pneumonias of the middle-aged, who are so liable to overwhelming congestions of the lungs, it is the sheet-anchor, given in large doses at the outset.

Trees, Seeds, Plants, &c.

PRESSED FERN,

Including the native creeping variety (*Lygodium palmatum*). Also a fine stock of Pressed Fronds, of the rare and beautiful Brazilian and New Zealand varieties. Per doz fronds, post-paid, 60 cts.; 6 doz., post-paid, $3. Address DEXTER SNOW, Chicopee, Mass.

CHERRY AND PLUM STOCKS.

FINE No. 1, ON SALE, by S. P. WILLIAMS, Dansville, Liv. Co., N. Y.

CABBAGE GROWERS.

We desire every man in the United States *who raises* Cabbage to send us his *name* and *address*. In return, we will forward, *free*, something *greatly to his interest*. Address TILLINGHAST BROS., La Plume, Luzerne Co., Pa.

POMONA NURSERY. MILLIONS OF Trees and Plants. Capt. Jack and Great American, the best Strawberries. Ten acres of *Brandywine* (Susquoco) Raspberries, yielded last summer $1,338. Send for Catalogue. WM. PARRY, Cinnaminson, N. J.

Trees, Seeds, Plants, &c.

VICK'S

Illustrated Priced

CATALOGUE.

Fifty pages—300 Illustrations, with Descriptions of thousands of the best Flowers and Vegetables in the world, and *the way to grow them*—all for a TWO CENT postage stamp. Printed in German and English.

Vick's Floral Guide, Quarterly, 25 cents a year.

Vick's Flower and Vegetable Garden, 50 cents in paper; in elegant cloth covers, $1.

Address JAMES VICK, Rochester, N. Y.

C. RAOUX'S

Nurserymen's Agency,

ESTABLISHED IN 1857,

76 Park Place,

P. O. Box 2956. New York City.

REPRESENTS IN THE UNITED STATES,

E. H. KRELAGE & SON, Nurserymen, Seedsmen and Florists, Haarlem, Holland.
JOHN STEWART & SONS, Nurserymen, Seedsmen and Florists, Dundee, Scotland.
PETER S. ROBERTSON & Co., Nurserymen, Seedsmen and Florists, Edinburgh, Scotland.
LEVAVASSEUR & FILS, Nurserymen and Florists, Ussy, France.

SATURDAY, NOV. 25, 1876.

HORTICULTURAL PROGRESS.

TWENTY-FIVE years in the history of the world is but a very brief period of time, still, like an additional inch in the length of a man's nose, it amounts to considerable when taken from, or added to, the life of a human being. The same truth holds good in taking a retrospective view of the developments and progress made in the various industries of our country during the past quarter of a century, and perhaps in none is it more manifestly apparent than in Horticulture. It is true, however, that we cannot claim to have made any wonderful discoveries, by the aid of which plants may be multiplied with the same celerity as signals are sent by telegraph; but the general dissemination of horticultural information among the masses has kept pace with the progress made in other departments of science and art.

The various operations which were formerly supposed to be the peculiar secrets of the horticultural fraternity—such as grafting, budding, propagating by cuttings of roots, ripe and green wood, crossing and hybridizing—are now the common property of one and all who will take the trouble to read the works published on these subjects.

Twenty-five years ago the great nurseries of Central New York, located at Syracuse, Rochester, Geneva and throughout the entire region of country extending from Albany to Buffalo, were but mere embryos of what they have since become. The man who at that time had his ten acres of apple or pear trees, was fearful that he could not find a market for so large a number of trees; in fact, "overstocking the market," was a topic frequently discussed among the Nurserymen of that day. But the very men who then were fearful of the consequences of planting fifty acres in nursery, have since increased the number to five or six hundred in some instances, and still find sale for all the stock produced. It is not only in Central New York where such progress has been made in the extending of nurseries, but like great establishments have sprung up all over the Western, Middle and Southern States.

The demand at first, in all newly-settled regions, is mainly for apple, pear and other fruit trees and useful plants; but time and the improvement in the financial condition of the inhabitants, bring with them a desire for the ornamental, and the Nurseryman finds himself compelled to be ever on the alert to meet the wants of his patrons. He is now no longer the sole possessor of the knowledge that a new fruit or ornamental plant has been produced in Europe or elsewhere, or one found in far-off China or Japan, for his neighbors and customers have also heard and read all about it and perhaps booked it for their next order, with thanks to such periodicals as the RURAL NEW-YORKER and its numerous able contemporaries, who note weekly what is going on in the horticultural world.

We might fill columns in mentioning the new fruits and plants introduced during the period named, also give scores of amusing and interesting instances of personal history of our leading Horticulturists; but it is, perhaps, enough to say that all have labored to bring about the grand results which are to be seen on every side in the magnificent orchards, splendid gardens and conservatories, filled with the choicest fruits and flowers that patient industry, time, skill and money can produce.

CHARITY AND ALMS-GIVING.

"THE melancholy days are come;" the sharp frosts have played havoc with the foliage, and that which a few days ago was bright and joy-giving, is now black and desolate and drear. The trees are now putting off their gorgeous drapery of crimson and gold and brown, stripping as if for a wrestling match with the winds of winter. The clouds look cold; ice forms over the still water; and all nature warns us that summer is past. The bees have provided their stores of honey; the squirrels are gathering nuts for future use and provident men have saved from their summer surplus, that which will serve them during the long, cold months that intervene between now and another spring-time.

But some men are not provident. Too many readily obey, literally, the injunction, "Take no thought for the morrow, what ye shall eat, or what ye shall drink or wherewithal ye shall be clothed." When the morrow comes they find themselves wanting the wherewithal to meet its demands and, in their necessity, turn to others for assistance. The professional tramp who has, during the summer, subsisted on the country by begging or stealing, as was most convenient or least laborious, has already turned cityward, scenting from afar, in imagination, the odors of the prospective charity soup-kettles; while the city beggar, who is always with us, turning ever a deaf ear to country allurements connected, as they are, with so much muscular energy as is necessary to walk from place to place—elongates still more the facial angle, drills the lachrymose glands into due subjection, cultivates an additional whine, and is ready for a fresh campaign.

It is these classes that dry up the milk of human kindness in the benevolent bosom. Many who would willingly relieve suffering, dread imposition. In the country, where each man knows not only his neighbor but all the residents for miles around, it is easy to determine who are worthy of assistance; but in town, where applications for aid are continually made by entire strangers, it is impossible to detect impostors. Some say, "Give whenever you can—your reward will be for your good intentions." But indiscriminate alms-giving is as injurious as it is unwise. It is offering an incentive to beggary and paying a premium for dishonesty. The charitably-intended soup-houses of our larger cities and towns are without doubt, as a rule, curses to the communities in which they exist. Such of our associations for the relief of the poor as conduct their affairs with as careful scrutiny as is possible, are constantly deceived, cheated and swindled. Many of those who apply for assistance might earn their living if they did not prefer beggary to labor. But how is one to decide where and in what manner to dispense such amount as can be readily spared, so that it shall be of the greatest service to others?

It is difficult to give general rules to meet all cases, but we would suggest that it is usually wise to help those who are willing and trying to help themselves. There are many who, from extravagance, foolish pride or want of economy, waste more every year than is necessary to support a small family respectably. It is this class that are constant borrowers when and where they can, and who are offended if asked to return the loan. Who does not know them? With fair incomes they never save, but are always behind-hand with their payments. We have no sympathy for such, and are inclined to think it not only unwise but wrong to help them. If they suffer, so be it—serves them right. When they had the opportunity they would not take the trouble to insure themselves against future want, and when their day of need comes others are not bound by any law of justice or morality to help them. If they have wasted their substance in riotous living, let them for a while subsist upon husks. DIVES, in his time, feasted while LAZARUS lay famishing at his gate; but afterward his prayers for even a drop of water went unanswered.

There are few who are so fortunate as not to have among their relatives, friends or acquaintances, deserving people who are in need of assistance. Even among the provident are often found those who know the bitterness of unavoidable poverty—those who, from no act or omission of their own, are in circumstances that make them dread the approach of winter. Many of them in former years may have lived in affluence, which makes their present condition seem more unbearable. This class should not be allowed to ask aid, but should be solicited to share your abundance.

It is always well, when possible, to bestow your money where you can see that good use is made of it; and, as a rule, it is better to pay than to give. He who furnishes lucrative employment, does better service than he who gives alms. Contributing to benevolent institutions is one way to satisfy conscience with but little trouble: and many of these institutions are worthy of support. Satisfy yourself that they are honestly and well managed, and then give until you are satisfied.

If you are at a loss what to do with ten or a hundred dollars, you can probably find no better almoner than your family physician. A judicious doctor—man or woman—will be able to make the same amount of money do the most real service; probably ten times as much as you can. Penetrating as they do into the secret life of many families, they see real want and suffering where others would never imagine it existed, and such men can often do great good with little money.

But in your distribution, remember the difference between alms-giving and charity. PAUL says:—"Though I bestow all my goods to feed the poor and have not charity" (*i. e.*, brotherly love) "it profiteth me nothing." And again, "He which soweth sparingly shall reap also sparingly; and he which soweth bountifully shall reap also bountifully. Every man according as he purposeth in his heart, so let him give; not grudgingly or of necessity, for GOD loveth a cheerful giver."

RURAL NOTES.

State Dairymen's Association. The Sixth Annual Convention of the New York State Dairymen's Association, and Board of Trade, will be held at the Academy of Music, Elmira, on Wednesday and Thursday, Dec. 13-14. In selecting Elmira as the place of meeting the Executive Committee were guided by a desire to accommodate the dairymen of the southern tier of counties. The programme is as follows:—Opening address by the President, X. A. WILLARD. The following gentlemen will read papers, or speak on the topics specified:—"Breeds of Cows for Dairy." Holsteins—Col. H. C. HOFFMAN, of Elmira, N. Y. Short-Horns—Hon. HARRIS LEWIS, of Frankfort, N. Y. Ayrshires—Dr. E. L. STURTEVANT, of Farmingham, Mass. Jerseys—W. L. RUTHERFORD, of Waddington, N. Y. H. A. MOTT, Jr., E. M. Ph. D., of New York—"Milk." J. M. PETERS, of New York Grocer—"Commerce of the Dairy." Prof. L. B. ARNOLD, of Rochester—"Dairy Products at the Centennial." All interested are invited to be present. Dairymen are invited to make an exhibition of butter and cheese and dairy utensils, for which committees of award will be appointed.

Many Good Subscribers.—Among the numerous kind words of encouragement received by us constantly, come a few from an appreciative subscriber in the far regions of Chetopa, Kansas. Should each one of our readers have the same intentions, the benefit would accrue to themselves, for we intend to increase the value and interest of the RURAL with the increased circulation. See what is said:

"EDS. RURAL NEW-YORKER:—I have always thought that I would make an effort to get up a club for the "dear old RURAL." I am going to try if you will send me the necessary papers. We have taken it for nine years, ever since we came to Kansas, notwithstanding the g. hoppers and drouth, let what would come, the money for our dear paper must be had, if we lived on two meals per day.—M. J. LENHART."

Overworked Editors.—Our excellent contemporary, The Prairie Farmer, announces that the essays, twelve in number, read before the National Agricultural Congress, will be published in its columns. We once heard of an editor of a country paper who was always late with his copy and, upon the last day, would make a pencil mark around a whole page of the Albany Argus and hand it to the foreman of his composition room with the order to "set it up." We wonder if this chap has moved to Chicago?

Poultry Show—Change of Date. The Bergen Co. (N. J.) Poultry Society will hold their First Annual Exhibition at Hackensack, N. J., Nov. 29 30, instead of the 22-23d, as announced in the RURAL October 28. This change in the time of holding the Fair has been made in order to recruit the birds shown at the Centennial and owned by members of this enterprising young Society. Competition open to the whole world, and breeders outside of the State are invited to send along their best birds.

RURAL BREVITIES.

A. D. F.—What did Io die of? Iodide of potassium, to be sure!

WANTED.—A gardener sufficiently muscular to "lay out" our grounds.

WHY is a retired pugilist like a preacher? Because he is an expounder.

AMERICAN apples—especially Newton pippins and the Lady apple—are reported to have made their appearance in Covent Garden Market, London.

THE British dairymen's organ, the London Milk, is not a milk-and-water sheet. A good serial for this paper would be the "Cow with the iron tail."

LI PO's idea of the result.—"One piecee man, all samee TILDEN ely. Hi, my catchee 'lection!' 'Publican men talkee joss-words, 'Damn, no can be—'lithmetic man makee 0 x 0—0?! *My no can tell!*"

A WORD TO EDITORS.—We are happy to see our numerous friends of the fraternity giving full appreciation to the original matter in the RURAL, by reprinting; but would it not be better to give credit occasionally?

A NEW FEATURE of the RURAL will be an Index of New Advertisements on another page and upon this page another Index to the reading matter. These will enable the reader to turn easily to that part of the paper in which he is most interested. We hope this will be a permanent improvement.

A SPECIAL OFFER of the Artichokes described and illustrated in this issue, will be found in the "PUBLISHER'S NOTICES." As our male subscribers have made complaints of being slighted in the matter of special offers, they would do well to examine this one. It is at the bottom of the column headed as above.

MR. WM. H. CARSON is trying to prove the efficacy of rotation. Having been for a long time of the firm of PETER HENDERSON & Co., the celebrated seedsmen, he has now started the same business for himself at 125 Chambers St., N. Y., and announces his intention of sending free his Illustrated Catalogue and Amateur's Guide to the Vegetable and Flower Garden to all applicants. It will be ready Jan. 1, 1877. Send in your applications.

TOM.

Yes, Tom's the best fellow that ever you knew.
Just listen to this:
When the old mill took fire and the flooring fell through,
And I with it helpless, there full in my view,
What do you think my eyes saw through the fire,
That crept along, crept along, nigher and nigher,
But Robin, my baby-boy, laughing to see
The shining? He must have come there after me,
Toddled along from the cottage without
Any one's missing him. Then, what a shout—
Oh! how I shouted, "For Heaven's sake, men,
Save little Robin?" Again and again
They tried, but the fire kept them back like a wall.
I could hear them go at it, and at it, and call,
"Never mind, baby, sit still like a man,
We're coming to get you as fast as we can."
They could not see him, but I could; he sat
Still on a beam, his little straw hat
Carefully placed by his side, and his eyes
Stared at the flame with a baby's surprise,
Calm and unconscious, as nearer it crept.
The roar of the fire up above must have kept
The sound of his mother's voice shrieking his name
From reaching the child. But *I* heard it. It came
Again and again. O God, what a cry!
The axes went faster, I saw the sparks fly
Where the men worked like tigers, nor minding the heat
That scorched them—when, suddenly, there at their feet,
The great beams leaped in—they saw him—then crash,
Down came the wall! The men made a dash—
Jumped out of the way—and I thought
"All's up with poor Robin," and brought
Slowly the arm that was least hurt to hide
The sight of the child there, when swift, at my side,
Some one rushed by, and went right through the flame
Straight as a dart, caught the child—and then came
Back with him—choking and crying, but saved!
Saved safe and sound!

Oh, how the men raved,
Shouted, and cried, and hurrahed! Then they all
Rushed at the work again, lest the back wall
Where I was lying, away from the fire,
Should fall in and bury me.

Oh! you'd admire
To see Robin now, he's as bright as a dime,
Deep in some mischief, too, most of the time;
Tom, it was, saved him! Now isn't it true
Tom's the best fellow that ever you knew?
There's Robin now—see he's strong as a log—
And there comes Tom, too—

Yes, Tom was our dog.

[*Constance Fenimore Woolson*

FASHION NOTES.

New York, Nov. 17, 1876.

Nowadays in selecting material for a costume a lady seldom limits herself to one particular kind of fabric; on the contrary, if she wishes to conform to the prevailing mode—and what lady does not?—she will combine her plain material with striped, plaided or brocaded goods, the quality and texture of which are determined by her individual preference for quiet or decided contrasts.

Nearly all the new goods are presented with a view to contrasts and combinations, and the same colors are observable in silks and woolens, though a similarity of tints is not considered necessary in constructing a fashionable costume. Dark invisible shades of green, blue and gray, together with deep claret and plum tints, are the leading hues for house, street and visiting costumes, while for evening-wear we have cardinal-red, *tilleul*, and cascade green, pale blue and delicate pink. Black is, as ever, a standard color, appropriate for any time or occasion, but the adoption of the dark shades mentioned has caused it to become less general. Another prominent feature of this season's display is the high rank of comparatively inexpensive materials. Silks, satins and velvets are shown in all their regal magnificence, but to such an extent has the manufacturers' art progressed that cashmere, *vigogne*, *de bege* and basket-cloth are now blended in costumes composed in part of these elegant materials.

Dress Goods.

In dress goods we find the silk and wool *damasse*, with palm leaf pattern, forty-eight inches wide, for $3 to $5 a yard, comprising all the new shades. Basket cloths are still popular, and are sold at prices ranging from $2 to $3. Plain camel's hair in all grades and shades, from $1.50 to $8 a yard. Camel's hair suitable for dolmans, in assorted colors, from $2 to $4 a yard. Panama cloths, in variegated stripes, can be had at from $1.50 to $2 a yard. Cashmeres are always fashionable. There are 100 different shades in cashmere and the prices vary from seventy-five cents to $1.50 a yard; the latter is forty-eight inches wide. All-wool brocatelles come in seventeen different shades, and prices that vary from sixty-five cents to $1. Diagonals, Knickerbockers, cheviot suitings, camel's hair cloths, serges, empress and mohairs are still in demand, and saline is again represented. There is no difference in the prices since last season.

Fur cloth, a new goods, looking like corduroy and made of silk and camels hair, is very stylish for travelling and costs from $1 to $1.50 a yard. There is an increased demand for plaids this year and the designs are more pronounced than heretofore. The beautiful Scotch plaids that once were the rage are again on the counters at prices ranging from fifty cents to $2 in double widths. A new thing in cashmere is a small check, in all colors and black, sold at $1.50 a yard. It is very neat. Cheap dress goods are shown in all styles and colors. There is the diagonal serge for twenty-five cents a yard and the imperial serge at the same price. A very good camels hair is offered for thirty cents a yard, and an imperfect serge for thirty-five and forty cents; plaids, in mixed goods, at twenty-five and forty cents the yard; a new goods, called centennial stripe, and French balmoral skirtings, for thirty-seven and a half cents. By this it will be seen that one need not have a fortune to dress well, and if cheap goods have not the quality of the more expensive, they make up with quite as much style.

Cloaks.

The favorite style in cloaks is very long; some almost touch the bottom of the dress. For winter wear the Olga, designed by Emile Pingar, is the most stylish and comfortable thing we saw. It is made of soft beaver cloth, very long, and trimmed around the collar, cuffs and pockets with braid of mammoth width and studded with enormous buttons. Price, $65. A very elegant cloak of black Sicilienne and black velvet, ornamented with passementerie and buttons, mandarin sleeves. This cloak reaches almost to the feet and is of Pingar design. Price, $285. Circulars are going to be very much worn this season, in light and dark cloths, costing from $50 to $75.

Our illustration is of a Ladies Street Costume. The engraving fully illustrates the graceful outline of a recent cloak design, which has a loose front, while the back is made half-fitting by the introduction of a center-seam which is discontinued a short distance from the bottom of the garment. It is long, and while ample enough to lie smoothly over the drapery of the costume, discloses a row of wide Titan braid. A deep, round collar, covered with the braid, encircles the neck; while from each shoulder descends a strip of braid, the two forming a deep point which extends nearly to the bottom of the cloak. The full sleeves are trimmed to correspond with the lower edges, and a single width of the trimming is used to simulate a large square pocket-lap. The front closes with *passementerie* frogs from the neck to the bottom, and the pattern to the cloak is No. 4578, price 35 cents.

The dress worn beneath is in 'Princess' style, and is fitted at each side of the front by a single dart, and at the back, which is short, by a seam at the center. The front and back are connected by an under-arm gore, through which another dart extends from the arm's-eye to the top of a long, pointed pocket with a pointed lap. A puff, to which a full skirt-portion is attached, overlies the lower portion of the back, both the puff and skirt being gathered at their upper edges to form ruffles. The sleeve is quite wide at the wrist, the outside seam flaring outward from below the elbow and being left open. A military collar completes the neck, and the front closes with buttonholes and buttons. No decoration, except pipings of the material, is used. Frolic.

The Story-Teller.

A MAN WHO LOST HIS NAME.

[Continued from page 334.]

IV.

At half-past four o'clock in the afternoon, Halfdan found himself standing in a large, dimly-lighted drawing-room, whose brilliant upholstery, luxurious carpets and fantastically-twisted furniture, dazzled and bewildered his senses. All was so strange, so strange; nowhere a familiar object to give rest to the wearied eye. Wherever he looked he saw his shabbily-attired figure repeated in the long crystal mirrors, and he became uncomfortably conscious of his thread-bare coat, his uncouth boots, and the general incongruity of his appearance. With every moment his uneasiness grew; and he was vaguely considering the propriety of a precipitate flight, when the rustle of a dress at the farther end of the room startled him and a small, plump lady, of a daintily-exquisite form, swept up toward him, gave a slight inclination of her head and sank down into an easy chair.

"You are Mr. ——, the Norwegian, who wishes to give music lessons?" she said, holding a pair of gold-framed eye-glasses up to her eyes, and running over the note which she held in her hand. It read as follows:

Dear Martha:—The bearer of this note is a young Norwegian—I forgot to ascertain his name—a friend of Olson's. He wishes to teach music. If you can help the poor devil and give him something to do, you will oblige, yours, H. V. K.

Mrs. Van Kirk was evidently, by at least twenty years, her husband's junior, and apparently not very far advanced in the forties. Her blonde hair, which was freshly crimped, fell lightly over her smooth, narrow forehead; her nose, mouth and chin had a neat distinctness of outline, her complexion was either naturally or artificially perfect, and her eyes, which were of the purest blue, had, owing to their near-sightedness, a certain pinched and scrutinizing look. This look, which was without the slightest touch of severity, indicating merely a lively degree of interest, was further emphasized by three small perpendicular wrinkles, which deepened and again relaxed according to the varying intensity of observation she bestowed upon the object which for the time engaged her attention.

"Your name, if you please?" said Mrs. Van Kirk, having for a while measured her visitor with a glance of mild scrutiny.

"Halfdan Bjerk."

"Half-dan B——, how do you spell that?"

"B-j-e-r-k."

"B-jerk. Well, but I mean, what is your name in English?"

Halfdan looked blank, and blushed to his ears.

"I wish to know," continued the lady, energetically, evidently anxious to help him out, "what your name would mean in plain English. B-jerk—it certainly must mean something."

"Bjerk is a tree—a birch tree."

"Very well, Birch—that is a very respectable name. And your first name? What did you say that was?"

"H-a-l-f-d-a-n."

"Half Dan! Why not a whole Dan, and be done with it? Dan Birch, or rather, Daniel Birch? Indeed, that sounds quite Christian."

"As you please, madam," faltered the victim, looking very unhappy.

"You will pardon my straightforwardness, won't you? B-jerk. I could never pronounce that, you know."

"Whatever may be agreeable to you, madam, will be sure to please me."

"That is very well said. And you will find that it always pays to try to please me. And you wish to teach music? If you have no objection, I will call my oldest daughter. She is an excellent judge of music, and if your playing meets with her approval, I will engage you, as my husband suggests, not to teach Edith, you understand, but my youngest child, Clara."

Halfdan bowed assent, and Mrs. Van Kirk rustled out into the hall, where she rang a bell, and re-entered. A servant in dress-coat appeared and again vanished as noiselessly as he had come. To our Norseman there was something weird and uncanny about these silent entrances and exits; he could hardly repress a shudder. He had been accustomed to hear the clatter of people's heels upon the bare floors, as they approached, and the audible *crescendo* of their footsteps gave one warning, and prevented any one from being taken by surprise. While absorbed in these reflections, his senses must have been partly dormant; for just then Miss Edith Van Kirk entered, unheralded by anything but a hovering perfume, the effect of which was to lull him still deeper into his wondering abstraction.

"Mr. Birch," said Mrs. Van Kirk, "this is my daughter Miss Edith," and as Halfdan sprang to his feet and bowed with visible embarrassment, she continued:

"Edith, this is Mr. Daniel Birch, whom your father has sent here to know if he would be serviceable as a music teacher for Clara. And now, dear, you will have to decide about the merits of Mr. Birch. I don't know enough about music to be anything of a judge."

"If Mr. Birch will be kind enough to play," said Miss Edith, with a languid musical intonation, "I shall be happy to listen to him."

Halfdan silently signified his willingness and followed the ladies to a smaller apartment which was separated from the drawing-room by folding doors. The apparition of the beautiful young girl who was walking at his side had suddenly filled him with a strange burning and shuddering happiness; he could not tear his eyes away from her; she held him as by a powerful spell. And still, all the while he had a painful sub-consciousness of his own unfortunate appearance, which was thrown into cruel relief by her splendor. The tall, lithe magnificence of her form, the airy elegance of her toilet, which seemed the perfection of self-concealing art, the elastic deliberateness of her step—all wrought like a gentle, deliciously soothing opiate upon the Norseman's fancy and lifted him into hitherto unknown regions of mingled misery and bliss. She seemed a combination of the most divine contradictions, one moment supremely conscious and in the next adorably child-like and simple; now full of arts and coquettish innuendoes, then again *naïve*, unthinking and almost boyishly blunt and direct—in a word, one of those miraculous New York girls whom abstractly one may disapprove of, but in the concrete must abjectly adore. This easy predominance of the masculine heart over the masculine reason in the presence of an impressive woman, has been the *motif* of a thousand tragedies in times past, and will inspire a thousand more in times to come.

Halfdan sat down at the grand piano and played Chopin's *Nocturne* in *G major*, flinging out that elaborate filigree of sound with an impetuosity and superb *abandon* which caused the ladies to exchange astonished glances behind his back. The transitions from the light and ethereal texture of melody to the simple, more concrete theme, which he rendered with delicate shadings of articulation, were sufficiently startling to impress even a less cultivated ear than that of Edith Van Kirk, who had, indeed, exhausted whatever musical resources New York has to offer. And she *was* most profoundly impressed. As he glided over the last *pianissimo* notes toward the two concluding chords (an ending so characteristic of Chopin) she rose and hurried to his side with a heedless eagerness, which was more eloquent than emphatic words of praise.

"Won't you please repeat this passage?" she said, humming the air with soft modulations; "I have always regarded the monotonous repetition of this strain"—and she indicated it lightly by a few touches of the keys—"as rather a blemish of an otherwise perfect composition. But as you play it, it is anything but monotonous. You put into this single phrase a more intense meaning and a greater variety of thought than I ever suspected it was capable of expressing."

"It is my favorite composition," answered he

LADIES' STREET COSTUME.

modestly. "I have bestowed more thought upon it than upon anything I have ever played, unless perhaps, it be the one in *G minor*, which, with all its differences of mood and phraseology, expresses an essentially kindred thought."

"My dear Mr. Birch," exclaimed Mrs. Van Kirk, whom his skillful employment of technical terms (in spite of his indifferent accent) had impressed even more than his rendering of the overture—"you are a consummate artist, and we shall deem it a great privilege if you will undertake to instruct our child. I have listened to you with profound satisfaction."

Halfdan acknowledged the compliment by a bow and a blush, and repeated the latter part of the *nocturne* according to Edith's request.

"And now," resumed Edith, "may I trouble you to play the *G minor*, which has even more puzzled me than the one you have just played."

"It ought really to have been played first," replied Halfdan. "It is far intenser in its coloring and has a more passionate ring, but its conclusion does not seem to be final. There is no rest in it, and it seems oddly enough to be a mere transition into the *major*, which is its proper supplement and completes the fragmentary thought."

Mother and daughter once more telegraphed wondering looks at each other, while Halfdan plunged into the impetuous movements of the *minor nocturne*, which he played to the end with ever-increasing fervor and animation.

"Mr. Birch," said Edith, as he arose from the piano with a flushed face and the agitation of the music still tingling through his nerves. "You are a far greater musician than you seem to be aware of. I have not been taking lessons for some time; but you have aroused all my musical ambition, and if you will accept me too, as a pupil, I shall deem it a favor."

"I hardly know if I can teach you anything," answered he, while his eyes dwelt with keen delight on her beautiful form. "But in my present position, I can hardly afford to decline so flattering an offer."

"You mean to say that you would decline it if you were in a position to do so," said she, smiling.

"No, only that I should question my conscience more closely."

"Ah, never mind. I shall take all the responsibility. I shall cheerfully consent to being imposed upon by you."

Mrs. Van Kirk in the meanwhile, had been examining the contents of a fragrant Russia-leather pocket-book, and she now drew out two crisp ten-dollar notes and held them out toward him.

"I prefer to make sure of you by paying you in advance," said she, with a cheerfully familiar nod and a critical glance at his attire, the meaning of which he did not fail to detect. "Somebody else might make the same discovery that we have made to-day and outbid us. And we do not want to be cheated out of our good fortune in having been the first to secure so valuable a prize."

"You need have no fear on that score, madam," retorted Halfdan with a vivid blush, and purposely misinterpreting the polite subterfuge. "You may rely upon my promise. I shall be here again, as soon as you wish me to return."

"Then, if you please, we shall look for you to-morrow morning at ten o'clock."

And Mrs. Van Kirk hesitatingly folded up her notes and replaced them in her pocket-book.

To our idealist there was something extremely odious in this sudden offer of money. It was the first time any one had offered to pay him, and it seemed to put him on a level with a common day-laborer. His first impulse was to resent it as a gratuitous humiliation; but a glance at Mrs. Van Kirk's countenance, which was all aglow with officious benevolence, reassured him, and his indignation died away.

That same afternoon Olson, having been informed of his friend's good fortune, volunteered a loan of a hundred dollars, and accompanied him to a fashionable tailor, where he underwent a pleasing metamorphosis.—[To be continued.

AN EXPENSIVE TRAIN.

A Russian Story.

At the time when the first open court of law was established in Russia a lady, dressed with the utmost elegance, was walking on the Moscow promenade, leaning upon her husband's arm, and letting the long train of her rich dress sweep the dust and dirt of the street.

A young officer, coming hastily from a side street, was so careless as to catch one of his spurs in the lady's train, and in an instant a great piece was torn out of the costly but frail material of the dress.

"I beg a thousand pardons, madam," said the officer, with a polite bow; and then was about passing on, when he was detained by the lady's husband.

"You have insulted my wife."

"Nothing was further from my intention, sir. Your wife's long dress is to blame for the accident, which I sincerely regret, and I beg you once more to receive my apologies for any carelessness on my part." Thereupon he attempted to hasten on.

"You shall not escape so," said the lady, with her head thrown back in a spirited way. "To-day is the first time I have worn this dress, and it cost me two hundred rubles, which you must make good."

"My dear madam, I beg you not to detain me. I am obliged to go on duty at once. As to the two hundred rubles—I really cannot help the length of your dress, yet I beg your pardon for not having been more cautious."

"You shall not stir, sir. That you are obliged to go on duty is nothing to us. My wife is right; the dress must be made good."

The officer's face grew pale.

"You force me to break through the rules of the service, and I shall receive punishment."

"Pay the two hundred rubles and you are free."

The quickly changing color in the young man's face betrayed how inwardly disturbed he was; but stepping close to them both, he said, with apparent self-command:—"You will renounce your claim when I tell you that I am a—a—poor man, who has nothing to live on but his officer's pay, and the amount of that pay hardly reaches the sum of two hundred rubles in a whole year. I can, therefore, make no amends for the misfortune, except by again begging your pardon."

"Oh! anybody could say all that; but we'll see if it's true; we'll find out if you have nothing but your pay. I declare myself not satisfied with your excuses and I demand my money," persisted the lady, in the hard voice of a thoroughly unfeeling woman.

"That is true—you are right," the husband added, dutifully supporting her. "By good luck we have the open court now just in session. Go with us before the judge and he will decide the matter."

All further protestation on the officer's part that he was poor, that he was expected on duty, etc., did not help matters. Out of respect for his uniform and to avoid an open scene, he had to go with them to the court-room, where the gallery was densely packed with a crowd of people.

After waiting some time, the lady had leave to bring her complaint.

"What have you to answer to this complaint?" said the judge, turning to the officer, who seemed embarrassed and half in despair.

"On the whole, very little. As the lateness of the hour and being on duty, compelled me to hurry, I did not notice this lady's train, which was dragging on the ground. I caught one of my spurs in it, and had the misfortune to tear the dress. Madam would not receive my excuses, but perhaps now she might find herself more disposed to forgiveness when I again declare, so help me God, that I committed this awkward blunder without any mischievous intention, and I earnestly beg she will pardon me."

A murmur ran through the gallery, evidently from the people taking sides with the defendant, and against long trains in general and the lady in particular.

The judge called to order and asked, "Are you satisfied with the defendant's explanation?"

"Not at all satisfied. I demand two hundred rubles in payment for my torn dress."

"Defendant, will you pay this sum?"

"I would have paid it long before this had I been in a position to do so. Unfortunately, I am poor. My pay as an officer is all I have to live on."

"You hear, complainant, that the defendant is not able to pay the sum you demand of him. Do you still wish the complaint to stand?"

An unbroken stillness reigned throughout the hall, and the young officer's breath could be heard coming hard.

"I wish it to stand. The law shall give me my rights."

There ran through the rows of people a murmur of indignation that sounded like a rushing of water.

"Consider, complainant, the consequences of your demand. The defendant can be punished only through being deprived of his personal liberty, and by that you could obtain no satisfaction; while to the defendant it might prove the greatest injury in his rank and position as an officer, and especially as he is an officer who is poor and dependent upon his pay. Do you still insist upon your complaint?"

"I still insist upon it."

The course the affair was taking seemed to have become painful to the lady's husband. He spoke with his wife urgently but, as could be seen by the way she held up her head and the energy with which she shook it, quite uselessly. The judge was just going on to a further consideration of the case, when a loud voice was heard from the audience:

"I will place two hundred rubles at the service of the defendant."

There followed a silence, during which a gentleman forced his way through the crowd and placed himself by the young officer's side.

"Sir, I am the Prince W——, and beg you will oblige me by accepting the loan of the two hundred rubles in question."

"Prince, I am not worthy of your kindness, for I don't know if I shall ever be able to pay the loan," answered the young man in a voice tremulous with emotion.

"Take the money at all events. I can wait until you are able to return it." Thereupon the prince held out two notes of a hundred rubles each and coming close up to him, whispered a few words very softly. There was a sudden lighting up of the officer's face. He immediately took the two notes and turning toward the lady, handed them to her with a polite bow.

"I hope, madam, you are satisfied?"

With a malicious smile she reached out her hand for the money.

"Yes; now I am satisfied."

With a scornful glance over the crowd of spectators, she prepared to leave the court-room on her husband's arm.

"Stop, madam," said the officer, who suddenly became like another man, with a firm and confident manner.

"What do you want?"

The look that the young woman cast upon him was as insulting as possible.

"I want my dress," he answered, with a slight but still perfectly polite bow.

"Give me your address, and I will send it to you."

"Oh, no, my dear madam. I am in the habit of taking my purchases with me at once. Favor me with the dress immediately."

A shout of approbation came from the gallery.

"Order!" cried the judge.

"What an insane demand!" said the lady's husband. "My wife cannot undress herself here."

"I have nothing to do with you, sir, in this matter, but only with the complainant. Be so good, madam, as to give me the dress immediately. I am in a great hurry, my affairs are urgent, and I cannot wait a moment longer."

The pleasure of the audience at the expense of the lady increased with every word, until it was hard to enforce any approach to quiet, so that either party could be heard.

"Do not jest any more about it. I will hurry, and send you the dress as soon as possible."

"I am not jesting. I demand from the representative of the law my own property—that dress," said the officer, raising his voice.

The judge, thus appealed to, decided promptly.

"The officer is right, madam. You are obliged to hand him over the dress on the spot."

"I can't undress myself here before all these people and go home without any dress on," said the young woman, with anger and tears.

"You should have thought of that sooner. Now you have no time to lose. Either give up the dress of your own accord, or"——a nod that could not be misinterpreted brought to the lady's side two officers of justice, who seemed about to take upon themselves the office of my lady's maid.

"Take your money back and leave me my dress."

"Oh, no, madam; that dress is now worth more than two hundred rubles to me."

"How much do you ask for it?"

"Two thousand rubles," said the officer, firmly.

"I will pay the sum," the weeping lady's husband responded, promptly. "I have here five hundred rubles. Give me pen and paper and I will write an order upon my banker for the remaining fifteen hundred."

After he had written the draft the worthy pair withdrew, amidst hisses from the audience.—*Hartford Times.*

SAYINGS OF THE ANCIENTS.

It is a great evil not to be able to bear an evil.—*Bion.*

Be more prompt to go to a friend in adversity than in prosperity.—*Chilo.*

Our greatest glory is not in never falling, but in rising every time we fall.—*Confucius.*

Let him who neglects to raise the fallen, fear lest, when he falls, no one will stretch out his hand to lift him up.—*Eldin Sadi.*

We do not choose our own parts in life, and have nothing to do with those parts. Our simple duty is confined to playing them well.—*Epictetus.*

A wise man will always be contented with his condition, and will live rather according to the precepts of virtue than according to the customs of his country.—*Antisthenes.*

You cannot be buried in obscurity; you are exposed upon a grand theater to the view of the world. If your actions are upright and benevolent, be assured they will augment your power and happiness.—*Cyrus.*

Honest name is goodly; but he that hunteth only for that, is like him that had rather seem warm than be warm, and edgeth a single coat with fur.—*Sir Thomas Wyatt.*

Xenophon relates that, when an Armenian prince had been taken captive with his princess by Cyrus, and was asked what he would give to be restored to his kingdom, he replied:—"As for my kingdom and liberty, I value them not; but if my blood would redeem my princess, I would cheerfully give it for her." When Cyrus had liberated them both, the princess was asked what she thought of Cyrus. "I did not see him," she said; "I noticed only him who offered to die for me."

Sabbath Reading.

IN A CHURCHYARD.

The lonesome wind of autumn grieves;
The northern lights are seen;
October sheds her changing leaves
Upon a churchyard green,
Where, sitting pensive in the sun,
While fading grasses wave,
I watch the crickets leap and run,
Upon a stranger's grave.

There is no sigh of fluttering leaf,
No sob of rustling grass;
The breezes o'er this place of grief
In breathless whisper pass:
Yet, like a murmur in a dream,
Purls on that insect voice—
The vacant voice which does not seem
To mourn or to rejoice.

A tone that hath no soothing grace,
A tone that nothing saith,
A tone that's like this solemn place
Of memory, tears and death—
It darkens hope, it deepens gloom,
Black fear and doubt profound,
Turning the silence of the tomb
To more mysterious sound.

There's a night upon the face of fame;
There's a night on beauty's eyes;
Nor pure renown nor glorious shame
From out their ashes rise;
In vain the shrines of prayer are trod—
Nor sound or silence breathe
The thought that flowers upon this sod
The secret hid beneath.

Ah, piteous, desolate and drear
This nameless stranger's sleep,
O'er which the slowly dying year
Is all that seems to weep.
God help him in that bitter day
[His heart, his reason save],
Who hears the crickets chirp at play
Upon his darling's grave.

RELIGION AND MANNERS.

Good religion and good manners always go together. They are things that God has joined, and no man can put them asunder. This follows from the nature of religion, which is the love of God and the love of our fellow men. It is a compliance, in some good degree, with the two great commandments of the divine law. It is the exercise of proper feelings toward God and a corresponding treatment of Him, and the like toward our neighbor. He who has true religion is a renewed man. Holy love has been shed abroad in his heart by the Holy Spirit. And that love makes him kindly disposed toward all. This the precepts of the Gospel require of him. He is to love not only those who love him and to treat them kindly, but he is to love even his enemies, if he has them, and to treat them with kindness. So did the Saviour, who is to be the example of all his disciples.

Religion, having its seat in the heart, is developed in the outward life. It modifies and shapes the conduct. It has upon its possessor a refining influence. It improves his manners. Under its power he becomes more kind and gentle and courteous. Such was its effect upon the great apostle. Before his conversion, he was impetuous and headstrong. He was overbearing, caring little for the interests of others. But religion tamed him. It subdued his natural ferocity and made him lamb-like. To the Thessalonian Christians he thus wrote:—"We were gentle among you, even as a nurse cherisheth her children." We find him, in all circumstances, an example of courtesy.

But it may be said that some Christians are unmannerly and boorish. They are greatly lacking in kindliness and friendliness. We are constrained to admit that it is so. We are not ourselves strangers to such. But it is nevertheless true, as we said at the outset, that good religion and good manners always go together. There are no exceptions. It is no more true that good religion and dishonesty go together, than it is that good religion and ill manners go together. Those boorish and unmannerly Christians are lacking in good religion. They are greatly deficient here; and that is the reason why they behave no better. Let them increase their religion; let them get more of the genuine article, and they will be improved outwardly in an equal degree as inwardly. There is not a defect or deficiency at which some precept of the Gospel does not aim a blow, and which is not rebuked by the example of Him who was "holy, harmless and undefiled." To learn good manners, one does not need to go to school to Lord Chesterfield. He can better learn them in the school of Christ, where he has ever before him perfect rules and a perfect example.—*H. S., in Observer.*

CHURCH NOTES.

The article in the Baptist Quarterly for October, by Prof. Alvah Hovey, on Baptist statistics for a century, gives the following results:—The Baptists in the Colonies in 1876 numbered 25,000; the number in the United States in 1876 is 1,800,000. In 1776 they had no academy or college; in 1876 they sustain 9 theological seminaries, 37 colleges, and 44 academies.

Following the example of the Mohammedans of Bombay, a number of the Mohammedans of Madras held a public meeting upon October 7 to express sympathy with Turkey. The correspondent of the London Times, however, expresses the opinion that the bulk of the Mohammedans of India know little and care less about Turkey.

Ladies' Portfolio.

ONLY A LOCK OF HAIR.

BY H. F. B.

ONLY a lock of hair,
And a bright red lock, at that,
I saw gently slide to the ground
From under the jaunty hat,
But the wearer was lost in the crowd,
And I picked up the curl with a start,
And into my pocket it went—
The pocket that's next to my heart.

I wore it there nearly a week,
And looked at it every night,
Till I fancied I'd give all the world
To see the blue eyes bright.
Of course her eyes were blue,
With hair the color of this;
How bewitchingly sweet they seemed,
As I gave the curl a kiss.

I thought of her every day,
I dreamed of her every night,
But I never had met her in any way
Since she vanished from my sight.
I looked, and hunted, and searched,
With the most persevering art,
But I never could match the curl that lay
In the pocket next my heart.

But down at my boarding house,
We had hash for breakfast, one morning,
I remember it perfectly well,
For there, without previous warning,
Creeping up from the cold, gray hash,
Lay a single golden hair,
With the same indescribable tinge
Of the curl in my pocket there.

I always paid for my board,
And I always paid the cash,
And oh! I was hungry that morning,
But I couldn't eat any hash.
For now my sweet hopes were blasted,
And my brain was all in a whirl,
For I knew that at last I had found it—
A match for my golden curl.

Only a single hair,
And a bright red hair at that,
But the heart underneath that curl
Gave a sickening pitapat.

I felt so despondingly faint,
I asked for a glass of water,
It was brought very soon, by the hands
Of my landlady's buxom daughter.
The sun shone across her hair,
A frowzy mat of red,
I felt very much, I confess,
Like throwing the glass at her head.

I went straight up to my room,
Where nobody else would know it,
And flung the curl out of the window
As far as I ever could throw it.
And I made up my mind to this verdict,
As I slammed down the blinds and the sash:
Golden hair may look pretty in ringlets,
But it don't look so pretty in hash!

Only a woman's hair,
And bright red hair, at that,
I'm ashamed that ever my poor heart throbbed
For a thing so silly as that.

A REPLY TO JACQUELINA.

EDS. RURAL:—I find by reference to your issue of Oct. 7th, that, under the heading of "Exception Taken," your correspondent JACQUELINA attempts a review and criticism of an article entitled "Woman," appearing in issue of Sept. 23d. The original proposition was that our girls should be prepared for the common, every-day duties of life, by initiation into the practical and detailed operations of keeping a house, and not the house keeping them. We hope that it is not "decreed that you (our American girls) shall forswear music, turn your backs on the library, and dedicate your lives henceforth to cookery books and wash-tubs." Do you, on the contrary, if possessing a talent for music or any of the kindred arts, cultivate it with all your hearts, and despise nothing which tends to elevate the sex to a higher plane of intellectuality. At the same time remember that it is the "comforts of home" which render the hearthstone delightful, and not a sparkling intellectuality alone; although an intimate acquaintance with dish-washing and floor-scrubbing, according to JACQUELINA, tends to degrade woman into a mere drudge.

My experience and observation have been far from this, and I carry in my mind's eye, at this moment, one who, with an acquaintance with current literature and an intimate knowledge of science—spending several hours a day in assisting her husband in his researches—entertaining also her friends handsomely; yet attends personally to all her domestic duties, keeping no domestic, still everything in this home is the perfection of neatness, order and good taste.

As regards our German friends, I look upon the charge of laxity of morals and acerbity of temper as a mere figment of the imagination. Unfortunately, influences foreign to virtue are too rife in our midst, and we would do well to first purge our own atmosphere from the immorality that pervades it before criticising too severely our foreign relations. Does educated New York set forth such brilliant examples of moral worth and domestic virtue, that we must heap upon our German cousins the charge of inconstancy, etc., to make our virtues still more virtuous? We may well hide our diminished heads in very shame for the palpable and open violations of marriage vows that are daily presented to us, and through what?—want of occupation! It is not she who earns her five to eight hundred dollars a year who falls from grace, but the daughters of idleness, whose morning hours are spent in bed, and who rise only to wish that night would come, that they may offer themselves at the shrine of fashion.

She who earns her five hundred to eight hundred dollars per year, as cited, does so not only from choice, but because of the superior quality of her attainments over those of her humbler sister. It does not follow that she is degraded by devotion to any honorable employment, and if her taste and inclination lead her to adopt merchandise, music or the languages as a means of support, all should respect and honor her the more for that independence, and she is more worthy to bear the name of wife and mother than she who only awaits the first acceptable offer of marriage, with the anticipation of presiding over an establishment, of the duties of which she knows nothing and cares less. The "goody man," instead of finding a comfortable home, finds such as his servants make for him, for the reason that he has married a woman "whose hands are white, complexion delicate, and who possesses a knowledge of literature, music, fine arts," etc., consequently cannot condescend to the practical affairs of the household. Even her children are brought up by the servant, rather than by her who bore them, because of the claims of society upon her.

NAPOLEON said the great want of France was *mothers*. So with this country. Our great want is good, practical wives and mothers. When such shall be met with, as in times past, we shall have better men, better government, less peculation, robbery and general dishonesty in high as well as low places. It is to woman, our guide and teacher in infancy as in later life, we look for those principles of goodness, rectitude and honor which shall carry us, as it were, armor-plated through the wiles and temptations of life.

COUNTRY LIVING.

COMING home from a trip to Philadelphia, last week, my thoughts naturally reverted to the different manner in which city people are obliged to live in contrast with our free-and-easy life of peace and plenty in happy rural homes. Articles of diet we esteem so lightly—rich cream and golden butter, plenty of vegetables from the garden, and a rich supply of ruddy apples and luscious grapes—are items of great importance in a city household, indeed its most valued luxuries. *Fresh* eggs are procurable, but require money and an honest dealer, so different from the searchings the children have in the fragrant hay where the cunning hens deposit their treasures. As I sit here in sight of the garden, now bare and wintry, I can see JAMIE not far off, filling his pockets with apples that are only now discovered, because the leaves have fallen from the Pippin trees, where they always linger late. STANTON and WILLIE are taking up the Gladioli from their tiny gardens, and their voices are loud and glad, as they imitate now the birds of the wood and then the self-important "cock-a-doodle-doo" of the barnyard. Baby HOPE, with waving hair, wind tossed, and shining eyes full of glee, has been gathering leaves, the red and yellow treasures that her sex delight in at this time of the year, and then with the same characteristic carelessness tossing them away, to pursue fresher, brighter leaves.

I cannot help thinking, as I see this freedom and joyous way of living, of the care-worn mothers in the cities, whose daily fear is lest some fast-hurrying car or runaway horse should hurt their darling, if by chance he left the stony bareness of the doorstep. And I say to those who, like myself, may sometimes feel the lack of city conveniences, or the society they would choose—be content; no place on earth is so adapted for the proper growth of children—physically, morally or mentally—as the pure and innocent pleasures and healthful atmosphere of a happy country home. ANNIE L. JACK.

CHOOSE the course which you adopt, with deliberation; but, when you have adopted it, then persevere in it with firmness.—*Bias.*

THE vicissitudes of life suffer us not to be elated by any present good fortune or to admire that fellcity which is liable to change. Futurity carries for every man many various and uncertain events in its bosom.—*Solon.*

Reading for the Young.

THE SLEEPY HOUR.

BY ELEANOR BURR.

"I AWFUL sleepy now, mama!
Too sleepy to undress;
Fo me into my trundle-bed
Just as I am, I guess.

"I fink, mama, you tuck me up
Wid 8 oes and ap'on on;
I fink, mama, I won't be tucked
When I'm a big, big man,

"Wid 'penders on my back, mama,
Wid cane, boots, and much fings now;—
I fink I can't no more lie in,
And,—say, mama! you fink so too?

"I too sleepy to 'pway le Lord,'
He know I lay me down,
'Cause why, mama? you much times said
He know me all le time."

The baby's eyes were drooping quite:
And through his parted lips
The pulsing breath, with tiny might,
Rolled rythmic, gentle, sweet.

Angels guard him—I doubt it not—
Through the long hours of night;
My birt will wake as soon as any,
When the world swings into light.

WINTER EVENING AMUSEMENTS.—No. 1.

ANOTHER CHANCE.

MY DEAR NEICES AND NEPHEWS:—I see by letters from my young relations that there is more than one side to some questions, and that my nephews have an idea that the literary talent is not altogether owned by my sprightly neices. Now I have not the least doubt—I think on mature consideration, I will reserve my doubts for Christmas presents, only adding that if the boys are as good at writing essays as they are at criticising the efforts of others, I have a mine of literary talent in my family that is bound to make my declining years happy ones. I am pleased to see that criticism is sharp, without being malicious, a sign that your hearts govern your heads; and it is a further proof that, although large, our family is a happy and united one.

I am free to confess that when I set your last task, JOAN OF ARC, I had some misgivings about your ability to meet all the requirements. I confided these doubts to the cat, who only looked sleepily wise, as if to say that he knew a thing or two, if he cared to divulge what was passing in his mind; but wife said I was an old fogy and that she would be very much mistaken if the girls did not surprise me. They did. The answers sent were a credit to them. If, however, my nephews are such bright young fellows, why did they not point out the errors in Miss BESSIE MCLEAN'S version of the story of JOAN OF ARC? I caused it to be published *precisely* as written for that purpose.

But we will say no more about this. I am going to put your professions to the test this week, and expect *all* to give their old uncle an evidence of their ability to make good their assertions. In the following little preachment I have told you about all I know of certain historical events. I am afraid that I am considerably mixed about dates, names, and even events; but you can't expect an old fellow to remember everything he ever read. You, however, are fresh from studies that give you this very knowledge, and I expect you to send to Uncle TRUE, care RURAL NEW-YORKER, 78 Duane St., N. Y., a *corrected* copy of the article, pointing out all errors that you can find. Mind, this must be done without the aid, or advice of your instructors or elders. Answers may be sent until Dec. 2d, which will give those living at a distance every opportunity to compete for the

PRIZE

I intend to offer. I have, in anticipation of this scheme, secured a number or beautiful smilax plants, quite the prettiest creeping vine we have. It makes a charming house ornament and can be used in various ways for decoration. To each successful competitor I shall mail one of these plants, besides publishing in *our* column a complete list of the fortunate ones. UNCLE TRUE.

A Misstatement of Facts.

The history of the United States presents a succession of phenomena unparalleled in the experience of any other nation of the world. We know that COLUMBUS landed in Florida about 1492, and that JOHN CABOT, during the reign of HENRY VIII., arrived off the coast of Newfoundland, claiming the country in the name of England. Other countries followed in quick succession, until the globe was circumnavigated for the first time in 1521 by Sir FRANCIS DRAKE, who also introduced tobacco into Europe. In 1530 FRANCISCO PIZARRO landed at Panama and at once set out to conquer Brazil, after having subjugated Montezuma, and penetrated as far north as Oregon. In 1565 PEDRO MELENDEZ was appointed Governor of Florida by Philip V. He founded the oldest city in the U. S., St. Augustine. The natives were called Indians because they were red! The country was settled by degrees, colonies being founded by Sir W. RALEIGH, Gen. JAMES OGLETHORPE, The Dutch East India Co, and others. Jamestown was named in honor of JAMES II. The Hudson River was named after Sir JOHN HUDSON, who took possession of the contiguous country in the name of the Dutch East India Co. The first settlement of Puritans, who were driven from England by the persecutions of "Bloody" MARY, was made by JOHN CARVER, 1621. They started in two vessels the May Flower and the ——, but the latter vessel was lost with all on board!

The first Indian war occurred in Massachusetts in 1641 on which occasion 350 whites were massacred in one hour.

The first American Congress met in Massachusetts at the suggestion of New York, May 1695.

The immediate cause of the Revolutionary War was what is known as Writs of Assistance, which gave customs officers the right to enter private dwellings. This was in 1771. The Stamp Act in 1765 was the straw that broke the camel's back.

The famous sentiment, "no taxation without representation," was uttered by Thos. JEFFERSON.

The battle of Bunker Hill began the revolution, and the battle of New Orleans ended the struggle.

The gloomiest period of the war was in '77 when the American army was quartered at Valley Forge, on the Delaware.

The two first political parties were the Federalists and Democrats, among the former were HANCOCK and JAY, while JEFFERSON, MADISON and MONROE were shining lights of the Democracy. Up to the present time we have had 16 presidents, and it is a question, from present appearances, whether this generation will live long enough to learn the name of the seventeenth.

LETTERS FROM BOYS AND GIRLS.

From Big Cousin.

NOW, Mr. RURAL, just let me be your Cousin for this once. I've got something to say, and have been waiting for somebody to say it. But they don't say it, so I can't stand it any longer. I am going to talk about tobacco chewers and smokers. I know it is a hazardous undertaking; but the only way to do them any good is to hit 'em hard, if they do get mad. Let them try the experiment—throw their pipes and tobacco in the fire—do without it—and my word for it, they will become healthier, wealthier, and wiser too.

How many of the fair sex are there who have not suffered from tobacco smoke, caused by some brother, father, lord or master, as he feels himself to be, or he would not dare to make himself so disgustingly offensive? Just think of it! After supper he gets out his pipe, fills it with tobacco and there he sits and puffs the room full of tobacco smoke. What does he care if it is offensive to others, or how much suffering or coughing it causes his weak-lunged or consumptive sister, wife or mother? Nor is this all. Next morning, when cleaning-up time comes, the unfortunate fair one finds tobacco spit on the walls, stove and floor, which she must wash up. Then there is the spittoon. Ugh! If they would just make that filthy creature clean it himself, he could not but wonder how a man can make such a beast of himself.

Now boys, come here! Do you see your old grandpa sitting over in that chair? Look at the tobacco juice running out of the corners of his mouth and down his chin, and when he spits he can't spit straight, so he hits the spittoon, floor, and anything else that is within reach. Pa smokes and chews too, does he? You have a right to do as pa does, have you? "Pa thinks he looks nice with a cigar in his mouth"—that's the reason, eh? Wait till he gets as old as grandpa and he will look just the same. You are not going to look like that, eh? Your grandpa commenced at your age, and if you don't quit you will surely look just as he does. Now boys, never touch it! Little girls, use all your influence to keep the boys from using tobacco until they are twenty-one; then they will see the folly of it and will likely never touch it. Now how many will do this?

And now thanking you, Mr. RURAL, for your valuable space, I close. And if these tobacco consumers pitch into you too hard, just run down your back-stairs and tell them that it was all done by your—BIG COUSIN.

Prepare to be Entertained.

DEAR GIRLS:—Fly around and put things in order. Put your piece-work away and prepare to be entertained. *The boys have come.* After all, it *does* take the boys to make things lively. We felt the effect of that Storm clear up here. It's getting pretty late in the season for thunder. Better let us have some snow next. I wonder if

BELLE'S not claiming to be a Cousin had any influence with him. I see he, too, thinks we agree too well. YOUNG EDITOR, No. 2, is splendid. I liked his letter very much better than I did No. 1's. But how do you like the "city pumpkin's" letter? I think he must have studied the Dictionary considerable to find so many long words,—and he says he has written *two* letters before that one. My! I wonder if they were all in the same style. FLORENCE, when you are arranging your autumn leaves, take a strip of cloth like your window curtains, and about an inch wide. Sew leaves on it so as to form a wreath; then loop it around the curtain, and see if it is not pretty. Don't sew the leaves too close together. VIRGINIA, *Maple Grove, Mich.*

We Apologize.

DEAR RURAL:—I long looked to see my letter in print, but have given up the hope of seeing it now. You see, I have courage to write again after looking so long in vain, and then being disappointed. It may be that it was not properly directed and you never received it. But if this falls to the waste-basket, I will give up all hope and think I am not a welcome Cousin. This is the third year I have taken your paper and I like it very much and think I will take it another year. Father thinks no paper equal to it. I must now talk about something else or I will make my letter too long. We have a very pretty yard in spring and summer, but now the flowers are almost gone; we have a good many winter ones coming on. Father keeps store and we don't see much of him much night, when he comes home to our bright fireside. We have a happy home—a kind father and mother—and are surrounded with flowers. We have a nice orchard, but we did not have much fruit this year. I will close.—COUSIN REDBIRD.

Will You Exchange?

DEAR COUSINS:—I agree with Cousin GYPSY BELLE about piecing quilts. I have pieced seven quilts, and have commenced another. I think it would be very nice for the girls to exchange quilt patterns. STORM must not be too sure about saying that the boys could beat any of the histories written by the girls. Pride will have a fall; for if the boys could beat the girls writing history, why did they not write? No! Mr. STORM, I think you are mistaken. I would like to correspond with MAY LANG. Perhaps some of the girls would like to know how I keep my Madeira Vines. After I take them up in the fall, I shake all the dirt off them, and then I take a paper sack (a flour sack will do), put them in it, and hang up in the cellar where they will not freeze. In the spring they will look wilted, but plant them and they will grow. I would like to correspond with some of the girls about flowers.—WILD FERN.

P. S.—Will YOUNG PRINTER please tell us the name of his paper?—W. F.

A Surprise Party.

DEAR COUSINS:—We are three sisters. Our father has a vineyard. We take nine weekly papers, but we like the RURAL the best of all. We suppose that some of the little girls like dolls, but they never say so. We like flowers very well, but we like to play with our dolls better. Father went to the Centennial, and among the presents he brought home were two boxes of splendid paper dolls. Father does not know of this letter. We want to surprise him.—CORA, LIZZIE AND ANNIE.

A New York Girl.

DEAR EDITOR:—My father has been taking the RURAL for about three years, and I like the paper very much, and read the Letters from Boys and Girls. I am a Western New York girl. Last summer I studied Geography and the Primary Arithmetic and read in the Third Reader. My father keeps a lot of poultry. I have four brothers and one sister, and I am ten years old.—MARY A. S.

The Puzzler.

MISCELLANEOUS ENIGMA.

I AM composed of 28 letters:
My 18, 12, 5, 15, 9, 27 is the goddess of morning.
My 3, 13, 21, 1, 2 is a lady's name.
My 10, 24, 17, 8, 6, 19, 18 is a man of Bible times.
My 16, 22, 24, 16, 3 is a sharp instrument.
My 4, 12, 26, 7 is a sort of shee.
My 25, 11, 18, 28, 23 is to remain still.
My 14 is a letter of the alphabet.
My whole is a quotation from Pope.

☞ Answer in two weeks. LITTLE ONE.

HIDDEN OUTBUILDINGS ON A FARM.

1. REPEAT that second bar, Nellie.
2. I once visited Dunstable, Mass.
3. The groom's name was Patrick.
4. Do you like the game of cribbage?
5. I live in Front St., ye know.
6. Coo, pretty pigeon, to thy mate.
7. I dinna ken; Nellie, do you?
8. We sailed on the river Ver and a squall arose.
9. Clear out, rough man.

☞ Answer in two weeks. MIC.

PUZZLER ANSWERS.—Nov. 11.

BIBLICAL ENIGMA.—"Blessed are the peace-makers: for they shall be called the children of God.

MISCELLANEOUS ENIGMA.—Sierra Espinhaco.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.90 for the two, may select any two of the following-named plants and a paper of the seed of the Moluccа Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory or garden. Its growth is rapid—small plants attaining the hight of five feet during the summer months. In the fall it may be cut back to any desirable size and potted for the winter, when it will quickly recover its symmetry and resume its ever-blooming habit. Its quick and exceeding popularity is a sufficient guarantee of its merits.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is as yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class. It is difficult to select a more attractive plant than Marie Lemoine when freely blooming. Every truss is in itself a bouquet. The leaves are large, zoneless, vigorous. The plant is compact and, like *Abutilon Boule de Neige*, is invaluable, either for the conservatory, window or garden.

Hydrangea paniculata grandiflora.—So much has been said of this Japanese shrub during the past year that little need be added now. It has stood 26° below zero unharmed. It begins blooming in early August, continuing until after hard frosts. The thyrses of flowers, first greenish-white, then white, then rose, often measure a foot in length and twenty inches in circumference. Every stem being thus terminated, the striking appearance of an entire plant may be conceived. There can be no doubt that this is one of the most valuable of all perfectly hardy shrubs.

Variegated Ampelopsis or *Vitis heterophylla variegata*.—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green, much as *Abutilon Thomsoni* is variegated with green and yellow. From its racemes of flowers are formed fruit as large as currants, each one of which is a different color in shades of claret, azure-blue and green. These berries, which are first as soft as a currant, become finally as hard as bullets.

The pretty stems are also variegated, green, whitish and rose. The roots are perfectly hardy, and the vine's growth so rapid that it will cover twenty-five feet square in a season. For conservatory walls or pillars, for trellises or rockeries, it cannot fail to please. It has been growing in the RURAL EXPERIMENTAL GROUNDS for several years without the least protection.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the singular Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

Jerusalem Artichoke.—Believing that the Jerusalem artichokes are exceedingly valuable as food for nearly all kinds of farm stock, we place them among our valuable premium plants. They will yield more bushels of tubers per acre than the common potato and we believe them more valuable for feeding purposes, besides the artichoke will grow vigorously where the potato would fail entirely. We will send one-half pound of each of the Long Purple, and Round White, for each new subscriber as above, or one pound of the tubers of either variety. We shall store a quantity of the tubers in the cellar for sending out this winter; but those of our subscribers who reside north of the latitude of New York City, had better leave their plant premiums in our hands after the first of January until early spring. We will, however, "book" all orders received during the winter, to be sent at the earliest possible moment.

TERMS FOR 1877, IN ADVANCE,

INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.50 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $11.25; Seven Copies, and one free, for $16.05; Ten Copies, and one free, $20—only $2 per copy. The above rates *include postage* (under the new law) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 25 cents extra for each subscription. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

News of the Week.

HOME NEWS PARAGRAPHS.

DR. S. J. JANES has grown black tea at his place five miles from Thomasville, Ga., which compares favorably with the best imported from China.

AT a meeting of the Board of Directors of the Permanent Exhibition Company, held in Philadelphia, a partial organization was effected by the appointment of Clement M. Biddle as President and E. A. Rollins as Treasurer. The general features of the proposed rearrangement of space in the Main Building were discussed, and plans showing the portions to be occupied by the principal sections were presented and partly perfected.

The Vermont Legislature has passed the bill for filling the vacancy in the Electoral College by 129 to 19. The act is especially designed to meet the case of H. N. Sollace, said to be ineligible.

Gov. Stearns of Florida claims that he has the sole authority to count the electoral vote of that State.

President Grant pardons another of the St. Louis whiskey prisoners. Mr. McKee returns to his home and his office. The fine remitted.

United States Detective Officers Tyrell and Washburn, with the aid of two local detective officers, captured the two men who attempted to steal the remains of President Lincoln from the vault in Springfield, Ill., on the night of Nov. 7. Their names are Terrence Mullen, alias "T. Durnan," the proprietor of the "Hub Saloon," No. 294 West Madison street, where the arrests were made, and Jack Hughes, alias J. Smith, an old counterfeiter, connected with the notorious Ben Boyd. These men have been shadowed since the attempt was made to despoil the tomb, and the proof of their guilt is said to be abundant. The officers have taken the accused to Springfield to await the action of the Grand Jury.

South Carolina is counted for Hayes. Florida and Louisiana still in doubt.

The first incineration in this country will take place Dec. 6 in a crematory erected by Dr. Le Moyne, at Washington, Pa. It is estimated the body will be consumed in about five hours. Delegations from the Boards of Health of several leading cities will be present.

It is stated that a number of members of Congress have already signified their intention to offer amendments to the Constitution of the United States, for the purpose of avoiding in future the difficulties and dangers now attending the election of a President.

Civil Service Reform (!) Owing to the absence of so many superior officers and clerks during the Presidential election, the preparation of the annual reports of the heads of departments has been delayed; none of them have yet been placed in the hands of the Public Printer.

The ways of the buffalo as described by travelers in the far West are as strange as those of the Heathen Chinee. If a herd of these animals gets on the north side of a track, it will stand stupidly gazing, though the locomotive passes within a hundred yards of it. But if two miles from the track on the south side, the whole herd is thrown into the wildest commotion. Regardless of consequences it will make for the track, and if the train is in its way, each individual buffalo will go at it with the desperation of despair, plunging against or between the locomotive and the car.

There is a prospect of a direct trade springing up between the councils of Sovereigns of Industry in Massachusetts, composed of mechanics and operatives, and those in Maine, composed largely of farmers.

Can it be that all the officeholding Smiths have been colonized in Georgia? This record would almost make it appear so. J. M. Smith, No. 1, is Governor of the State; J. M. Smith, No. 2, is representative elect from Oglethorpe county: J. M. Smith, No. 3, was a candidate for Ordinary in Heard county; J. M. Smith, No. 4, was a candidate for Tax Collector in Talbot county; J. M. Smith, No. 5, is one of the most popular Justices of the Peace in Harris county; J. M. Smith, Nos. 6 and 7, have just vacated offices, and J. M. Smith, No. 8, was commander-in-chief of all the deputy marshals in the State on election day.

The Sophomore class of the University of Vermont have been suspended and fined two dollars each for raising a flag on the college park staff; and the members of the Freshman class were fined two dollars each for cutting the pole down.

The continued election excitement crazed Major Loring, a leading citizen of Holyoke, Mass., and he marshalled sixteen tramps who had spent the night in the police station, drilled them in the public square, and offered their services to Gen. Sherman by telegraph to quell an imaginary insurrection.

The fish commissioners of Vermont are stocking the Winooski river with Potomac bass, and expect to raise enough young in five years to stock Lake Champlain.

Although no clergyman is allowed in ordinary times to enter Girard College, Philadelphia, that rigid rule of Girard's will was relaxed during the six months of the exhibition.

A Virginian has erected a marble shaft near the city of Richmond, Va., bearing his name, with blank spaces for his age and the day of his death, and he chose the Poorhouse Cemetery for the site.

FOREIGN NOTES.

THE Baroness Ida von Duringsfeld, a well-known German writer, died at a hotel in Stuttgart the other day. Her tales and narratives of travel have enjoyed uninterrupted favor in Germany for the last thirty years. Her husband, Col. von Renssberg Duringsfeld, who was devoted to the study of ethnography and philology, brought out various works with his wife. He died of heart disease a few hours after her death. He had written to a friend to come on and attend to the Baroness's funeral and be with him during the sad ceremonies, but when his friend entered the room he found the Colonel dead in his chair.

Below is a condensation of the latest European dispatches, up to the time of going to press:

Turkey is said to agree unconditionally to a conference.

A Reuter telegram from St. Petersburg says that, in pursuance of the partial mobilization of the Russian army, preparations are now being made for the mobilization of a sanitary corps. Movable hospitals are also being got ready. Committees of ladies have been formed for the nursing of the wounded. The Empress of Russia and the Grand Duchess, it is stated, have assumed the patronage of these associations.

It is improbable that Gen. Tchernayeff will retain command of the Servian army in the event of Russia being driven to action, as his whole conduct in Servia has not given satisfaction in official quarters.

The Times' Calcutta dispatch says that the India Government is preparing to send a large contingent of troops to Egypt if war is declared in Europe.

The Parthia, which sailed from Liverpool on Nov. 18 for New York, took $750,000 in specie.

The Cologne Gazette's Paris correspondent says: "A principal obstacle to war seems to have been removed. The Rothschilds are said to have promised to advance Russia money. The loan will not be made publicly. Russia's conditions are said on 'Change to be so favorable that the Rothschilds can easily dispose of the loan privately.

The Standard's dispatch from Berlin says, "The Russian police profess that they have discovered a plot in Poland. The Roman Catholic Bishop of Zytomierz, in the province of Volhynia, has been arrested and imprisoned at Moscow. Several Polish curates have been thrown into prison at Warsaw. All dealers in arms are subjected to stringent regulations."

The Standard's Berlin dispatch reports that Turkey has sent a note to Bucharist asserting her right to send troops to Wallachia in the event of Russian invasion.

The Berlin Post asserts that several Americans have applied to the Russian Government for letters of marque to be used against English shipping in the event of war.

The Duchess d'Aosta, ex-Queen of Spain, died from disappointment over an unfulfilled ambition. She was a daughter of the Piedmontese Prince Cisterna, was born in 1848, married Prince Amadeus, second son of the King of Italy, in 1867, and with her husband was called to the Spanish throne in 1871. From early childhood her reading and study embraced mathematics and the kindred sciences, ancient and modern languages and history, and the more important elements of Roman and Italian law. The final acceptance of the Crown of Spain by her husband was due to her ambitious promptings. She was a woman of great benevolence and clear understanding. The abdication of Amadeus put an end to her hopes.

Latest accounts from Calcutta say that 120,000 persons perished during the cyclone which passed through Eastern Bengal on the 31st of October. The Government is taking active steps for the relief of the distressed population of the district.

The market, Mercado de Colon, Havana, was destroyed by fire Nov. 18.

A new sect called "The Purillers" has arisen in Russia. Their leading doctrines are said to be that all must marry on becoming of age, but that the husband must be subordinate to the wife, and recognize her as the head of the family. Also, that once a week he must confess his sins to his wife. They adhere to the Greek Church.

NOTWITHSTANDING large meat importations from the United States, the London butchers keep up their prices so high that the Globe advises co-operation, and that families should jointly market through a delegate, who would receive a small commission.

NEW INDUSTRY.

A COMPARATIVEY new industry has within a few years sprung up in our midst, by which many important materials for structural and other purposes have been greatly enchanced in value. We refer to the utilization of the indestructible, fibrous mineral asbestos in the manufacture of steam-pipe and boiler coverings, fire-proof coatings and cements, paints of all colors, roofing, sheathings, linings, etc., and as we find these articles are really worthy the attention of the public, we are pleased to note that the Centennial Medal and Diploma of Merit have been awarded to the patentee and manufacturer, Mr. H. W. Johns, No. 67 Maiden lane, N. Y., from whom the genuine asbestos materials can only be procured.

SEMI-BUSINESS PARAGRAPHS.

A Cough, Cold, or Sore Throat requires immediate attention and should be checked. If allowed to continue, irritation of the Lungs, a permanent Throat affection, or an incurable Lung disease is often the result. "BROWN'S BRONCHIAL TROCHES," having a direct influence on the parts, give immediate relief. For Bronchitis, Asthma, Catarrh, Consumptive and Throat Diseases, TROCHES *are used always with good success.*

$5.00 Given Away!—We will send *Free*, by mail, post-paid, the beautiful *Steel Engraving*, 2 feet wide and 2½ feet long, entitled "Christ in the Temple," that retails at $5.00 per copy, to any person sending us the names and post-office address of ten good farmers or persons in their neighborhood, and inclosing 25 cents to pay for wrapping, postage, roller and mounting the engraving. Address AGRICULTURAL MANUF'G CO., 179 West Fourth Street, Cincinnati, O.

Desperation!—JONES of Binghamton, N. Y., has evidently got desperate, for he offers Four-Ton Hay Scales at $30, freight prepaid. Send for description and say RURAL.

FRANK MILLER'S LEATHER PRESERVATIVE and Water Proof Blacking received the highest and only award at the Centennial Exhibition.

THE RURAL NEW-YORKER wants good local agents. Address RURAL PUB. CO., 78 Duane St.

FRANK MILLER'S HARNESS OIL received the highest and only award at the Centennial Exhibition.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 18, 1876.

BEANS AND PEAS.—Exports beans past week, 500 bbls.; since Jan. 1, 51,287 do.; same time last year, 30,322 do.

The offering of new mediums continues small, and as the stock of old is too poor for good grocery use, prices for prime are very firm, with some advance. There is a good supply of marrows, and with a moderate export trade, prices are weak. Good old-crop marrows are firm at our prices. Pea beans and W. kidneys are scarce and firm. Red kidneys arrive more liberally, and quotations are in buyer's favor. Canadian peas are steady and unchanged. Exports past week, 18,211 bush.; since Jan. 1st, 610,630 do.; same time last year, 315,803 do. Green peas are abundant. Considering the light wholesale trade doing so, B. E. peas lower.

Beans—New medium, $1.90@1.95; do. marrow, $2.20@2.25; do. pea, $2.20@2.25; white kidney, $2.30@2.35; red do., $2.25@2.50; Old Beans—Medium, prime, $1.70@1.80; other, $1.50@1.65; marrow, $1.80@2.30; pea, prime, $1.80@2.10; white kidney, prime, $1.75@2; red do., prime, $1.80@2; black, $2.30@2.45; Canadian peas, new, ₩ bbl, free, $1.12@1.15; do. bulk, 92@95c.; green do., new, $1.40@1.50; do., S. B. E. peas (2-bush. bag), $2@2.10.

BEESWAX.—Transactions are limited to small lots within the range of 30½@32c. for Western and Southern.

Exports past week, 1,072 lbs., since Jan. 1st, 65,245 do.; same time last year, 80,408 do.

BROOM CORN.—Demand is very light, while supplies are increasing.

Quoted at 7@8c. for short green brush, 6½@7½c. for green hurl, 5@6c. for medium green, and 3@4c. for red and red-tipped.

BUTTER.—There has been no improved business in both State and Western butter, and prices have been thereby prevented from running down, as was threatened during the stagnant period of election week. Fine State butter is very firm and brings the extreme. There is an abundance of good useful table stock held above the views of those who want such quality, and, for the moment, wholesale trade in many marks of half tubs and Welsh is limited. Firkins are very dull. The stock consisting lots from which the fall has been broken off and many small lines that have grown into an accumulation. We shall not have an excess of fine-flavored butter this season if the late liberal receipts form an indication. Foreign shippers are doing a fair business; their purchases include some Welsh. Western butter runs irregular in quality. There is no difficulty in placing the fresh-flavored dairy parked. Hall butter moves slowly this season. We want cold weather for a steady trade in rolls.

Exports past week 4,100 pkgs.

We quote:—Choice pails, 31@31c.; prime, 32@33c.; poor to good, 24@30c.; creamery pails, choice, 35@36c.; good, 33@34c.; sweet cream pails, 30@33c. State firkins, choice, 29@31c.; fair to good, 25@27c.; do. half firkin tubs, choice, 32@33c.; fair to prime, 26@30c.; do. Welsh tubs, choice, 30@31c.; other, 24@28c.; inferior State, 15@22c.; Western creamery, choice, 31@32c.; other, 31@33c.; do. firkins, best, 24@22c.; other, 15@18c.; dairy tubs, choice, 24@26c.; other, 15@18c.; factory choice, 22@24c.; other, 14@15c.

State dairies quotable at 30@32c. with full tubs Welsh tubs, dairies, 25@29c.

State firkins dairies 25@30c. Welsh tubs dairies, 26@30c. Roll butter, fair to prime, 24@25c.; do., poor, 18@20c.

CHEESE.—An advance in the Liverpool market has prompted export demand to a very fair extent. Orders have been largely for fancy colored factories of which the shipments show a marked increase for the week; a slight advance has been made on the more desirable lots; early in the week 13½c. was the more general rate, now 13¾c. is freely paid, and special lots to 14c. Fancy white factories do not run within one-half of these figures. The lower grades which are in chief supply, are rather steadier, but not higher as a rule.

Exports for the week, 31,013 boxes.

Fancy factory at 13¾@14¼c. for fancy white and colored; do., job lots, 14¼c.; good and prime, 12@13c.; fair, 10@11¼c. State farm dairy, fancy, 12@12¼c.; good to prime, 11@12c.; fair and good, 10@11c. Western factory, fancy, 12¾@13c.; good and prime, 11@12c.; fair lots, 9¾@10¾c.

COTTON.—The excited Liverpool market has caused rapid changes in prices here, and a large speculative trading.

The latest quotations are:—November, 11 15-16c.; December, 11 31-32@12c.; January, 12 3-32c.; February, 12¼@12 9-32c.; March, 12 15-32@13 7-16c.; April, 12 13-32@12¾c.; May, 12¾@12 29-32c.; June, 12 23-32@13 15-16c.; July, 13 1-16c.; August, 13¼@13 5-32c.

DRIED FRUITS.—Apples come in freely yet and stocks here are large. Very low prices are necessary on the moderate trade. Peaches are scarce and prices higher. Blackberries, raspberries and cherries favor sellers. We quote:

Apples—State, sliced, 6@6¾c.; do., quarters, 6¼@6½c.; Southern sliced, new, fair, 5@5½c.; choice do. 6¼@6¾c; fancy, 8½c.; do., new quarters, in bags, 4@4½c.; do. repacked, 5@5½c.; Western quarters 5c. Blackberries at 8½@8¾c. Peeled peaches, new, at 18@20c.; unpeeled nearness, halves, 9@10c.; do. quarters, 8½@9c. Raspberries, 28@29c. Cherries, 17½c.

Exports past week 5,367 bbls. apples; since Jan. 1st, 21,132 do., same time last year, 10,520 do.

EGGS.—The market has ruled about as before but trade is not active. Dealers, however, do not want to drop prices suddenly, as strong rates for fresh have sometimes started a demand for limed. If that is now the point it is not a success so far, as limed are hardly moving; offered lower. Among the incidents we note shipments of several hundred bbls. of fresh eggs to Havana and Glasgow. We quote:

Near points, 33@34c.; State and Penn., 28@29c.; Western, prime, 28@28½c.; do. other, 27½c.; Canadian, 27½@28c.

State limed, 21c.; Western, do., 18@20c.

ESSENTIAL OILS.—The following are the current quotations.

Peppermint, $2.50 ₩ lb., in tin, $3.25@3.50 in glass—lane firm. Sassafras scarce and firm at 50c. ₩ lb. Wintergreen, large supply, weak at $2.50. Spearmint, nominally $2.50 ₩ lb.; no demand.

FLOUR.—Exporters have bought more freely, and the whole market shows increased trade with prices strong; the quotations are $4.50@5 for poor to very choice superfine State; $5.30@5.40 for very common to fair extra do.; $5.40@5.45 for good extra do.; $5.50@5.55 for fancy do., and $5.70@7 for fancy to very choice extra; $4.50@5 for superfine Michigan, Indiana, Iowa, &c.; $5.30@5.45 for shipping extra do., the inside price for inferior, and $5.50@5.70 for choice to very fancy extra do.; common to choice white wheat extras, $5.65@6.80; fancy do. $6.85@8; winter wheat, good to choice family $6.25@8.25; round-hoop Ohio, $5.50@5.10, and trade brands of do. at $5.40@7; St. Louis $5.50@6.15 for common to fair extra, and $6.50@8.25 for good to very choice; Minnesota "straight" at $6.35@7.50, and patent at $7.30@9.50; unsound stock at from $3.50@5.30; city mill extra for West Indies at $6.15@6.40; do. English brands, $5.30@—; do. trade and family, $7.10@8.50; No. 2 at $3.60@4.25. Buckwheat flour brings $3 to $3.10, and buckwheat grain 75c. ₩ bushel.

Corn meal selling at $2.75@3.15 for yellow western, Pennsylvania and Jersey, and $4.10 for Brandywine.

FRESH FRUITS.—Exports of apples past week, 13,125 bbls.; since Jan. 1st, 82,661 do. There is a spirited demand for apples. The supply is large, and buyers have good selection at the low prices. Export demand brisk. Fancy apples for export quoted at $1.75 for Spitzenbergs and $1.75@2.50 for Newtown Pippins. Florida oranges in fair demand. It is suggested that Florida growers settle upon a uniform size of box. Such a decision would prove a benefit to all parties. Catawba grapes are firm; Isabella dull. Cranberries quiet. The weather has been somewhat trying for them. Thanksgiving week will perhaps give them a start. California pears $3@3.50 per box for the winter varieties. The sorts in store are Easter Beurre, Winter Nellis, Glout Morceau and Vicars, the latter useful now. Peanuts a little firmer.

Apples, State, ₩ bbl., prime red, $1.50@1.75; winter, $1.37@1.50; mixed, $1.12@1.25; good to fair, 60@60c. Quinces, ₩ bbl., $8@12. California Quinces, $4@5 ₩ box; Cranberries, crates, $2.50@3.00; Eastern, good to prime, $7@9.50; N. J., $7.50@8.50, for good to prime. Grapes—Catawba, ₩ lb., 9@10c.; Isabella, 4@5c. Chestnuts, ₩ bush. $2.50@3.00. Hickory nuts, $1.00@2. Peanuts—Va., fancy, $1.20@1.30; other, 75c.@$1.15. Oranges—Louisiana, ₩ bbl., $6; Florida, box, $5.

GRAIN.—For wheat the market has been subject to frequent fluctuations, the whole position being affected as dispatches are received from the other side respecting the Eastern troubles. With the more belligerent character of recent developments, however, much more activity has resulted and prices have advanced. Latest sales at $1.30 for No. 3 Chicago spring, $1.30 for No. 2 Chicago spring, $1.32 for No. 2 Milwaukee spring, $1.23@1.30 for winter red Western, and $1.35@1.40 for white Western. Rye stronger; sales at 80@82c. for Western, 80@95c. for State, Jersey, Pennsylvania and Canada. Corn is in fair export demand and higher; sales at 50½@60½c. for Western mixed. Oats are higher and fairly active; sales at 33@36c. for mixed Western and State, and 38@39½c. for white do.

HAY AND STRAW.—There are increased receipts while demand is without marked improvement; prices show no material change.

Bale hay 60c. for shipping; 70@90c. for retail qualities; clover, 55@65c.; salt, do., 50@60c. Straw quoted at 75@75c. for long rye; 55@60c. for short rye, and 45@55c. for oat.

HONEY.—In fair demand. White clover in glass 15@20c.; Buckwheat, 10@11c.; Strained B. W., 9@11c.; Strained White, 13@14c.

HOPS.—Exports for this week, 1,200 bales; beyond this but little has been done, while receipts have been about 1,300 bales. The chief supplies are of grades under good, and for this class of stock weak prices prevail. Brewers buy from hand to mouth awaiting developments.

New Yorks, good to choice, new	32 to 35
New Yorks, low to fair, new	20 to 30
Eastern, new	30 to 34
Wisconsin, new	24 to 30
Yearlings	10 to 20
Olds, all growths	4 to 8
California, new	32 to 36

POULTRY AND GAME.—Live poultry not wanted. Dressed is now and will be the specialty from this forward. The low nominal quotations are:

New Jersey turkeys, 14@15c. ₩ lb.; Western, 10@12c. N. J. fowls and chicks, 12@13c.; State and Penn., 10@11c.; Western, 10@11c., roosters, 8@9c. Geese, N. J., ₩ pair, $1.75@2; Western, $1.35@1.62. Ducks, N. J., ₩ pair, 62@65c.; Western, 50@55c. Live pigeons, ₩ pair, 25c.

Dressed poultry has gone through another discouraging week—low prices, dull trade and bad-looking stock being the causes. Thanksgiving poultry should be here by the 28th at the latest. Turkeys are the most salable for that festival and large size is no objection.

Turkeys, N. J., 14@16c.; State, 14@15c.; Western, 10@11c. Chickens, dry-picked, 12@16c. N. J. chicks, 14@15c.; State, 10@11c.; Western, 11@13c. Ducks, N. J., 14@15c.; State, 12@15c.; Western, 9@11c. Geese, 8@10c. for common; 11@13c. for good to best. Inferior poultry, 5@8c.

Game is in fair demand without improved prices. Market well supplied. The demand for venison is improving. A good many quail arrive in poor order. Wild ducks are slow; quality not attractive. Canvas seldom quoted so low.

We quote.—Canvas-back ducks $1.00 for Havre de Grace and 75c. for Western. Red Head 50@60c.; Mallard 50c.; Teal 50c.; Widgeon 30@35c.; common 25@30c.

English Snipe, ₩ doz. $1@1.25. Quail, ₩ doz., prime, $1.37@1.62; soft, $1@1.25. Partridge, State, 65@70; Eastern, 60@65c.; Western, 40@60c.; Prairie Hens, 80c.@$1; Hares, 40@50c.; Rabbits, 30@35c. Venison, whole, 10@11c.; long saddle, 12@13c.; short do., 14@15c.

PROVISIONS.—The disturbances on the other side and a possibility of war, have been seized upon by speculators to advance the markets here. There is some influence felt from the light arrivals of hogs at the West, but this is accounted for by the very mild weather for the period of delivering shipments forward. Mess pork quoted at $17@17.25 for spot lots; $16.25 for December and January. Bacon at 8¾c. for long clear and 9¼c. for short clear; with long and short clear together, half each, for January 8¾c. Western steam lard at 11¾ on spot; $10.25 for December and January. Stearine at 11c. for prime Western. Tallow at 8¾c. for prime. Beef hams at $20 for choice Western. Beef, barreled lots, new, quoted at $10.50@11.50 for plain mess, $12@12.50 for extra mess, $13.50@14 for packet. Tierced quoted nominally at $19@21 for new prime mess and $21@23 for new India mess. City extra India mess at $27.

SEEDS.—Grass have been in active demand, and clover is much higher; sales of clover at 16c. ₩ lb., and timothy at $1.95 ₩ bushel.

SUNDRIES.—Western live geese feathers prime 55@58c; mixed, 40@50c. Cider unchanged. Ginseng, $1.10@1.20.

TOBACCO.—Exporters have bought sparingly, and there is rather an easy range of prices.

VEGETABLES.—Exports of potatoes past week, 4,122 bbls.; of onions, 800 do. Potatoes are a shade firmer for all good grades. A good many poorly-sorted parcels arrive, which sell under our inside range. Sweet potatoes steady. Marrow squash improving, as pumpkins are out of the way. We quote: Potatoes—Peach Blows ₩ bbl. $3.00@3.12. Early Rose, prime, $2.50@3.12; other $2.50@2.87; Peerless, bulk, $2.25@2.50; sweet, Del. $3.50@4; Va. $2.75@3. Cabbages, ₩ 100, $4@7. Marrow squash, ₩ bbl., 75c.@$1. New Russian turnips, ₩ bush., 50c.@—. Onions—Yellow, ₩ bbl., $1.75@2.00; white, $2.50@2.75; red, $1.50@1.75. Cauliflower, ₩ bbl., $8@1.50.

WOOL.—Speculators have been buying more freely of Western fleeces, California and Texas grades, for which very strong prices are made. The demand on manufacturing account is a little better. The supplies of fine fleeces are greatly reduced and the whole position of stocks favorable to full rates.

ROCHESTER, Nov. 18.—Flour market steady; spring, $6.75; amber winter, $7.00; white winter, $7.50; double extra, $7.75. Rye flour quiet at $5.00. Wheat quiet; Milwaukee club, $1.20@1.30; amber winter, $1.15@1.25; white winter, $1.20@1.27. Oats, nominal at 38@40c. Corn quiet at 58@62c. Corn meal, $1.25@1.30. Butter, 25@26c. Cheese, 12@13c. Eggs, 22@24c. Lard, 10@11½c. Apples, bu., 25@50c. Potatoes, bu., 70@75c. Beans, ₩ bu., 90@$1.70. Mess pork, $17.00. Wool, 25@30c. Hay, $12@13. Straw, $6@8. Timothy seed, $2.75@3.50; clover, $9.25 ₩ bu. Mill feed strong at $11 for shorts, $10 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 35c. ₩ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Nov. 18, 1876.

THERE has been an improved tone to the market this week, with a brisker trade and better prices. About 900 boxes of farm dairy cheese were to deliver and sales were made at 11@12¾c., with only two or three lots reaching the latter figure. About 8,000 boxes of factory cheese were offered and nearly 6,000 boxes changed hands. A fine quality of October cheese commanded 13c., and September cheese went at 13¼@13½c. So far as we could learn from salesmen present, there is only a light quantity of cheese held back at the factories.

There was a free delivery of butter and the market is firm. We note sales of farm dairy in Welsh tubs at 24@27c., and finer lots, with creamery, at 28@29c., a few choice and extra lots reaching 30c. The weather is remarkably mild for the season, with no frosts or snow of any account.

We have advices from abroad to the 30th of October. Our London correspondent says that the demand is good for the best sorts of cheese. American is higher and the quality not so good as early September. We give quotations:

American, extra fine, 56@58s.; fine, 52@54s.; good, 50@52s.; secondary and low grades, 46@48s. English cheddar brings from 82@90s.; Wiltshire double, 56@58s.; Cheshire medium, 46@48s.; fine, 42@44s.; Scotch, 40@44s. Dutch Cheese—Edams, 56@58s.; Goudas, 60@62s.; Derby shape, 46@48s.

Friesland butter is easier, but all other descriptions are firm. Fine American sold at 150s. ₩ cwt. Oleomargarines are taken in preference to secondary and inferior sorts. The prices are as follows:

Choicests, 116@120s.; Corks, 108s.; Boracts, 174s., Jersey, 96@98s.; Friesland, 126@130s.; Swedish, 104s.; Normandy extra, 120@124s.; American and Canadian, 126@130s. for best and 100@110s. for lower grades. Oleomargarine sells at 90@100s. ₩ cwt.

LIVE STOCK MARKETS.

" last week	11,157	71	1,529	27,262	30,295

BEEVES.—Trade on last Monday was firm at the closing rates of our last weekly report. The quality of the herds on sale influenced rates, which were higher than those last quoted. Prime were 8@9c. ₩ lb.; weights, 5¾@10 cwt. From 56@57 lbs., net, has been allowed. The herds to hand were all sold off, the top steers being of choice quality. Wednesday, trade firm at above quotations; quality poor to good. Prices were 8@10c. ₩ lb.; weights, 5¾@9 cwt. Thursday, trade small, at 6¾@10¼c.; weights, 1,600@— cwt. Friday, the markets closed fair at 7¾@10¾c.; weights, 5½@— cwt. Spanish herds sold at 8@8½c. Colorado steers, 8@8c.; Native do., grass fed, 8@9½c.; do. part corn fed, 9¾@10¾c.; grade do., 10¾@11c. Mixed herds, steers and oxen, 8@9c. Mixed herds, cows and heifers, with a few steers, 9@9½c. ₩ lb. Hulls, live weight, $2.50@3.80 ₩ cwt.

MILCH COWS.—Trade fair in fair quality fresh cows, poor do., held no sale. Ten cows sold at $45@55 ₩ head; 16 cows at $50@55; 17 do., $35@70; 5 do., $65@75 (calves always included).

VEALS AND CALVES.—Trade fair in smooth quality veals, which have been scarce. Coarse quality calves in heavy supply and slow of sale at 5@6½c. ₩ lb., also at $3.50@15.75 ₩ head. These latter all spotted from New York State. State veals, 8@11c.; Pennsylvania do., 8½@10¾c.; Jersey do., 9@9¾c.; Canada do., 8@8½c.

SHEEP AND LAMBS.—Trade has been fair, on a moderate run, since our last weekly report. The quality of the flocks has been from coarse to good. Monday last sheep sold at 4@6c. ₩ lb.; lambs at 5½@6¾c. Wednesday, sheep, 5@5¾c.; lambs, 5¾@6¾c. Friday, the market closed dull. Sheep, 4½@5¾c., lambs, 5¾@6½c. State and Canada lambs sold at 6@7¼c. Jersey ewes, 5@5½c.; Canada do., 5@6c.; State do., 4¾@5¾c. State sheep, 4¾@6c.; Ohio, 4@5c.; Pennsylvania, 5¾@5¾c.; Indiana, 4¾@4¾c.; Kentucky, 5@5¾c. State lambs, 5¾@6¾c.; Ohio do., 5¾c.; Canada, 6@6¾c.

HOGS.—Trade small in live hogs at 5¾@5¾c. ₩ lb. City dressed fair of sale at reduced rates. Heavy hogs, 6¾@7¾c.; light pigs, 7@7¼c.

HORSE MARKET.—Trade moderate, and interrupted by broken weather. Twenty head, poor quality, light harness horses sold at $100@$5; 30 do., $20@100; 10 do. ordinary quality, $150@190; 40 do., coarse quality, heavy draft horses, $62@120 ₩ head; 7 pairs do., $200@325; 3 pairs choice quality do., $525@600; 4 pairs stylish carriage horses, aged, $500@800 ₩ pair; 1 pair do., warranted sound, $1,000; 5 trotters, $200@550 ₩ head; 13 roadsters, not warranted sound, $225@330 ₩ head; 4 pairs family carriage horses, $500@720 ₩ pair; 5 saddle horses, poor quality, $80@150 ₩ head; 1 do., choice quality, $200.

TO COLOR BUTTER.

Mr. A. W. CHEEVER, in the New England Farmer of Nov. 11th, recommends all Dairymen to use

Wells, Richardson & Co.'s

PERFECTED BUTTER COLOR.

He says: "It is the strongest, purest and cheapest butter coloring we have ever used, and for all we can see it is absolutely perfect. It should entirely supercede carrots and all crude preparations of annatto in coloring butter."

It gives the exact shade of the best Jersey butter. It is pure, intense, economical, and has no taste or smell. It is an improvement on our "Golden Extract," being a combination of the bright yellow coloring principle of the Dandelion blossom, and is greatly superior to carrots, etc., giving a better color and no work.

☞ A sample sufficient to color fifty pounds of butter will be sent to any address, post-paid, on receipt of ten cents.

Every Dairyman who wishes to realize the highest price, should give it a trial *now*. Address

WELLS, RICHARDSON & CO., Burlington, Vermont.

BUTTER AND CHEESE Coloring, Extract of Cheese Rennet, used by the largest Dairies in Europe and America. Prize and Circular free. Sole Agent for U. S., Mrs. B. SMITH, 327 Arch St., Phila., Pa. Awarded Highest Centennial Prize Medal.

PERSONAL ITEMS.

A SISTER of Spurgeon, the London preacher, has entered the pulpit.

ALL men are not homeless, but some men are home less than others.

IN a French family who work at a mill in Slatersville, R. I., there are four pairs of twins.

SETH GREENE'S Lake Ontario shad have come to weigh four pounds each, and the old man is happy.

AN epigram by John Brougham:—"Man is a monopolist of an immortality he is not sure he possesses."

THE California Chinese wear coats of mail under their shirts, and when one of them is shot at he grins and turns the corner.

THE Independent has a flattering notice of a theater, and the Church Union notices a circus in a complimentary editorial article.

VERGENNES, Vermont, the oldest city in New England, is called the smallest city in the world, its area being less than two square miles.

THE standard of public intelligence in the State of Iowa is so high now, that they have to send to Kansas for jurymen in all Iowa law cases.

A CYNICAL man insists that the fewer relatives or friends the happier we are. "In your poverty they never help you, in your prosperity they always help themselves."

A WISCONSIN paper gravely informs its readers that the equestrian statue of McPherson represents the general as sitting on a stump before a camp fire, writing a dispatch.

AN Encyclopedia of British Journalism is in preparation by Cornelius Walford, the insurance writer. It is to be hoped that it will prove less open to adverse criticism than its predecessor, Mr. James Grant's.

PARIS has a grave difficulty to solve, what to do with her dead? For ten years has this subject been under consideration, and Baron Haussmann complained that the dead gave him far more trouble than the living.

A YOUNG girl in Stamford Conn., was whipped by her father for allowing an objectionable fellow to court her. She retaliated by putting arsenic in the parent's coffee twice, but each time made the dose so large that he was not killed.

DR. MARY WALKER is a little more conservative in the style of her dress since the dog bit her. She now wears a row of knife pleating all around the tails of her coat, and the waistband and the ends of the legs of her trousers are trimmed with ball fringe.

WHILE Lord Dufferin was traveling in Egypt a servant came to the door of his tent, and said in a dolorous voice, "If you please, my lord, the corpse has come aboard." By this depressing title he was pleased to designate a mummy discovered in a rock temple.

A LITTLE girl in Lewiston, Me., was ordered by her stepmother to wear gloves to school as a means of curing her of biting her nails. The child returned home barehanded, and the stepmother not only replaced the gloves but sewed them fast to the flesh at the wrists.

MR. MATHEW ARNOLD and Mr. Froude somewhat resemble each other, both having curiously long and harsh faces and the ugliest and largest mouths in all the universe of mouths. But they have strong and powerful heads and gray eyes, indicating judgment and reflection.

A SUNDAY-SCHOOL teacher was giving a lesson in Ruth. She wanted to bring out the kindness of Boaz in commanding the reapers to drop large handfuls of wheat. "Now, children," she said, "Boaz did another nice thing for Ruth; can you tell me what it was?" "Married her!" said one of the boys.

IN his "Confessions of a Drunkard," Charles Lamb says:—"Is there no middle way betwixt total abstinence and the excess which kills you? For your sake, gentle reader, and that you may never attain to my experience, with pain I must utter the dreadful truth that there is none—none that I can find."

BEHOLD another talker in the field. It is Miss Elizabeth Stuart Phelps, who is going to lecture several times upon "Representative Modern Fiction," before the College of Liberal Arts of Boston University. George Eliot will be dissected in four lectures. Representative modern fiction is a large subject.

DR. W. B. CARPENTER, the English psychologist is about to investigate spiritualism, with Mrs. Kane as the medium. Mrs. Kane is better known as Maggie Fox, who, with her sister Kate, produced the celebrated "Rochester rappings" in 1847, out of which modern spiritualism may be said to have grown.

AN Atlanta lover, who was made a lunatic by rejection, determined to kill everybody who might be his successful rival. He met two young men in the street soon after coming to that murderous determination, asked them if they were acquainted with the young woman, and shot them upon their answering in the affirmative.

THE Queen's Messengers, poor gentlemen of good family who carry despatches that can neither be intrusted to wire nor mail from the British Government to its representatives abroad, have been worked off their legs lately. One of them went from London to Constantinople, had twelve hours' rest, arrived in London on Saturday and had to start next day for Vienna. He was there one day, returned to London, and twenty-four hours later was on his way to St. Petersburg again.

Implements and Machinery.

Centennial Year of American Independence,

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you ples of the Celebrated Watches, manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION. These Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, fine Ruby Jeweled, set in Chaton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

Traveler's Guide.

CALIFORNIA.
Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?
The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oskosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.
This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.
This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.
For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO
via Cleveland.
Leaves Erie Railway Depot, foot of Chambers St. New York.
9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.
7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars
The only line running Hote Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer.*

It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.

S. A. F., Wyoming, N. Y.—I have for a long time read your paper with great interest, especially the Floricultural Department, for I am very fond of flowers. Many thanks to you for the valuable hints given—they have helped me to make my garden, the past summer, more beautiful than it otherwise would have been. Will you please tell me the name of the shrub that bears the inclosed pod and leaf? It grows beside a fence near my home, and has been allowed to remain there for a curiosity. It does not seem to grow over 15 feet high, but sprouts up from the roots. Some years the pods are very thick on the branches, but this year they are scarce. ANS.—The shrub is *Staphylea trifolia* (Bladder Nut).

Miss Caroline McDowell.—I have some Smilax seed. Will you please tell me through the RURAL how to grow them? ANS.—Precisely the same as you would the seeds of a Balsam or a Radish. There is no trouble about raising them whatever.

M. W.—What ails my Verbenas? All the cuttings that I started in sand are growing nicely, except the Verbenas; they all died. They look bright for a day or two, then curl up and turn black, as if scalded. All that I can do for them, I cannot succeed in getting one to grow. ANS.—Black Rust is the matter with them. Either the plants or the wood from which you took cuttings was too old. It may be that you keep them in too warm a place. Black Rust is caused by a minute insect not visible to the naked eye. The best remedy is to throw the plants away and try again.

W. E. Smith.—The London Journal of Horticulture, in a late number, answers your question, viz., "Why is Rosewood so-called?" When the tree is first cut the fresh wood possesses a very strong, Rose-like fragrance;—hence the name. The name was not, it is supposed, given for its color or markings.

L. W. Pratt.—The two large, soft beetles, with very short wing-covers of bluish tint and black body, are both females of the common Oil beetle (*Meloe angusticollis* of SAY). The males are somewhat smaller than the females, and are readily distinguished from them by a kind of knot or twist in the middle of the antennæ. There have been some fourteen or fifteen species of our native Meloes named and described, but there are still quite a number of new ones in the cabinets of our entomologists awaiting like honors. These Oil beetles are placed in the same family as the common Blister beetles, which also includes the well-known Spanish Fly of Southern Europe, so extensively employed as a vesicant. The species you send also possess vesicatory properties, but not in so powerful a degree as the members of the true cantharidæ. All of the several hundred species belonging to the *Meloe* family are leaf-eating beetles, some of them being very injurious to the potato. The Striped Blister beetle, *Epicouta vittata*, is sometimes very abundant in the Western States, and we have known them to strip every leaf from a field of potatoes in a few hours. We have also received complaints of the depredations of this very Oil beetle upon the potato, but they are seldom numerous enough to do much damage to cultivated plants.

A., London, Ont.—Different proportions of the same substances, when united, possess remarkably different properties and produce, in some cases, the most opposite effects. For instance, mercury and chlorine, united in a certain proportion, form the well-known medicine, calomel; united in another proportion, the terrible poison, corrosive sublimate, is formed. Nitrogen and oxygen unite in half-a-dozen different proportions, forming as many distinct compounds. Nitrous oxide, composed of one equivalent of nitrogen and one of oxygen, is the gas known as Laughing Gas. Nitric acid, composed of one equivalent of nitrogen and five of oxygen, is one of the most corrosive of acids. Now, the application of a certain quantity of a given chemical fertilizer to a certain soil might prove highly injurious, while if double the quantity were used it might prove highly beneficial. We must know the constituents of the soil ere we apply chemical manures. Guess-work, in a majority of instances, will prove a losing operation. It is, measurably, like prescribing medicine to a sick person before we have acquainted ourselves with the disease. Unless you can afford to experiment, use for the present such manure as you can make upon your farm, or buy horse manure.

W. R. Brooks.—Your plan for "Poultry-house and Park" is received and will appear next week, or as soon as the engravings can be made.

When answering advertisements, parties will please say that they saw them in the RURAL NEW-YORKER.

T. S. ARTHUR & SON, Philadelphia

THE COMPANION aims to be a favorite in every family—looked for eagerly by the young folks, and read with interest by the older. Its purpose is to interest while it amuses; to be judicious, practical, sensible, and to have really permanent worth, while it attracts for the hour.

It is handsomely illustrated, and has for contributors some of the most attractive writers in the country. Among these are:

J. T. Trowbridge,	Louisa M. Alcott,
Edward Eggleston,	J. G. Whittier,
James T. Field,	Louise C. Moulton,
Rebecca H. Davis,	C. A. Stephens,
Mrs. A. H. Leonowens,	Harriot P. Spofford,
Edward Everett Hale,	Julia Ward Howe.

Its reading is adapted to the old and young; is very comprehensive in its character. It gives

Stories of Adventure,	Stories of Home and
Letters of Travel,	School Life,
Editorials upon Current Topics,	Tales, Poetry,
Historical Articles,	Selections for Declamation,
Biograph'l Sketches,	Anecdotes, Puzzles,
Religious Articles,	Facts and Incidents.

Subscription Price, $1.75. Specimen copies sent free. Please mention in what paper you read this advertisement.

Wit and Humor.

HE'D BEEN TO THE CENTENNIAL.

A BASHFUL-APPEARING man stepped into the Enquirer editorial room the other evening, and edging up to the table of the managing editor, hat in hand, said, in a hesitating way:

"You like little items for your paper, I suppose?"

"Certainly," replied Mr. Cockerill, "a newspaper, like life, is made up of little items. What have you to offer?"

"Well," said the bashful man, playing with his hat-band, "my name is Smith, John Smith, and I've just got home."

"Glad to see you back again, Mr. Smith," said Cockerill, "been gone long?"

"I have been," said Mr. Smith, with a tremor of pride in his voice, "to the Centennial, and if you want to make a little notice ——"

"What!" cried Cockerill, springing to his feet; "you've been to the Centennial? And you've got back? Give us your hand; I am delighted to see you. Spear, let me introduce you to John Smith. John has been to the Centennial!"

Spear shook hands very warmly with Mr. Smith, and then ran to the aperture communicating with the reporter's room, and shouted, "O'Shaunnessey, come in here, quick: here's a man that's been to the Centennial."

Then O'Shaunnessey bounded in, followed by his assistants, all of whom embraced the bewildered Smith warmly, and expressed the gratification it afforded them to meet a man who had been to the great National Exhibition. Word got down stairs somehow, and Joe McDowell, Bill Small, and Uncle Joe Shadenger came up stairs at a tearing rate to gaze upon the individual who had been to the Exposition. It was too much for the modest man to bear, and murmuring something about making an item of his return if they wanted to, he hurried out just in time to meet on the stairs the foreman and thirty-two compositors—all eager to get a glimpse of the man who had "been to the Centennial."—*Cincinnati Saturday Night.*

SPARKS AND SPLINTERS.

A PROMINENT dentist is announced as ready to take the stump.

WHITE illusion bonnets are calculated to deceive the pocket book.

"JAKE," said the blushing damsel to a lover that her father had forbidden the house, "I don't care if you're feet are big; I love you just as much." "Well, Sally, I don't mind so much about the size of my own feet, but I wish you're dad's were a little smaller; I should feel more confident, you know, about staying."

WHAT HE WAS YELLING AT.—"What is that man yelling at?" asked an Illinois farmer of his boy, as he pointed to a person in the field one day this week.

"What is he yelling at?" repeated the lad.

"Yes," replied the father inquiringly.

"I know," said the boy.

"Then what is it, you young rascal?" demanded the paternal.

"Why," chuckled the urchin, "he's—he's yelling at—at the top of his voice!"

Then that cold-booded husbandman placed violent hands on his irreverent offspring, and laid him over a gang-plow while he flailed him with a fork-stale.

KNEE-PLUS ULSTER.

CHOICE BREEDS OF FOWLS.

THE interest in choice breeds of fowls does not seem to abate one whit in public estimation, with an increased familiarity and long acquaintance. There may be, it is true, an occasional lull in the demand for certain breeds; but none which possesses real merit remains unsought, for the natural variety of taste calls for a like variety of birds. The accompanying portraits show very clearly the character of three of the noted breeds, which have commanded more or less attention in this country, and are doing so at the present time.

Figure 1 is an excellent portrait of a Dark Brahma hen—in fact, may be considered a standard bird of this variety. The two varieties or breeds of the Brahma fowl are known as the Light and Dark, the principal difference consisting on their color, some breeders prefering the first and others the latter. TEGETMEIER, the celebrated English authority on domestic poultry, in speaking of the Brahmas, says that they "are doubtless the largest of all the varieties of domestic fowls. It is within our knowledge that cocks have been shown weighing the almost incredible weight of seventeen pounds."

The male birds of the Dark or Penciled Brahmas, as they are known by both of the above names, should have the upper part of the body—including the neck, hackle, back and saddle—silver white, striped with black; the breast, under part of body and thighs, black, slightly mottled with white. The feathers covering the base of the quill feathers of the wings are of a metallic green-black, and form a broad, well-marked bar across the wings. The quill feathers of the wings, or what are termed flight feathers, are white on the outer and black on the inner webs. The tail is black, the coverts on either side being of a beautiful lustrous greenish-black; the lesser feathers edged with white.

The color of the hen is: head gray, the neck hackle silvery white, striped with black. The remainder of the plumage should be dull-white, minutely and distinctly penciled throughout with dark penciling. The large size of the Brahmas makes them a very popular breed, although it must be admitted that the weight is not obtained without a corresponding expenditure in food.

DERBY GAMES.

The Game fowls are truly an English breed, having been brought to their high state of perfection under the care of men who have encouraged cock fighting in England.

What are termed the Derby Games, a pair of which are shown in Fig. 2, take their name from Lord DERBY, and are really an old breed, but through careful selection and breeding have not only been kept pure, but in a great measure improved of late years. Some of these fowls found in this country are said to be equal, if not superior, to anything found on the other side of the Atlantic; in fact, this may also be said of several other noted breeds of fowls.

The Game fowl is principally prized for the cockpit, and although of light weight, their flesh is as fine as that of any other breed, and were it not for the pugnacious disposition of the males, they would doubtless be far more extensively raised for the table than they are at present. The brilliant plumage and elegant carriage of the males make them rank among the most beautiful of our domestic fowls.

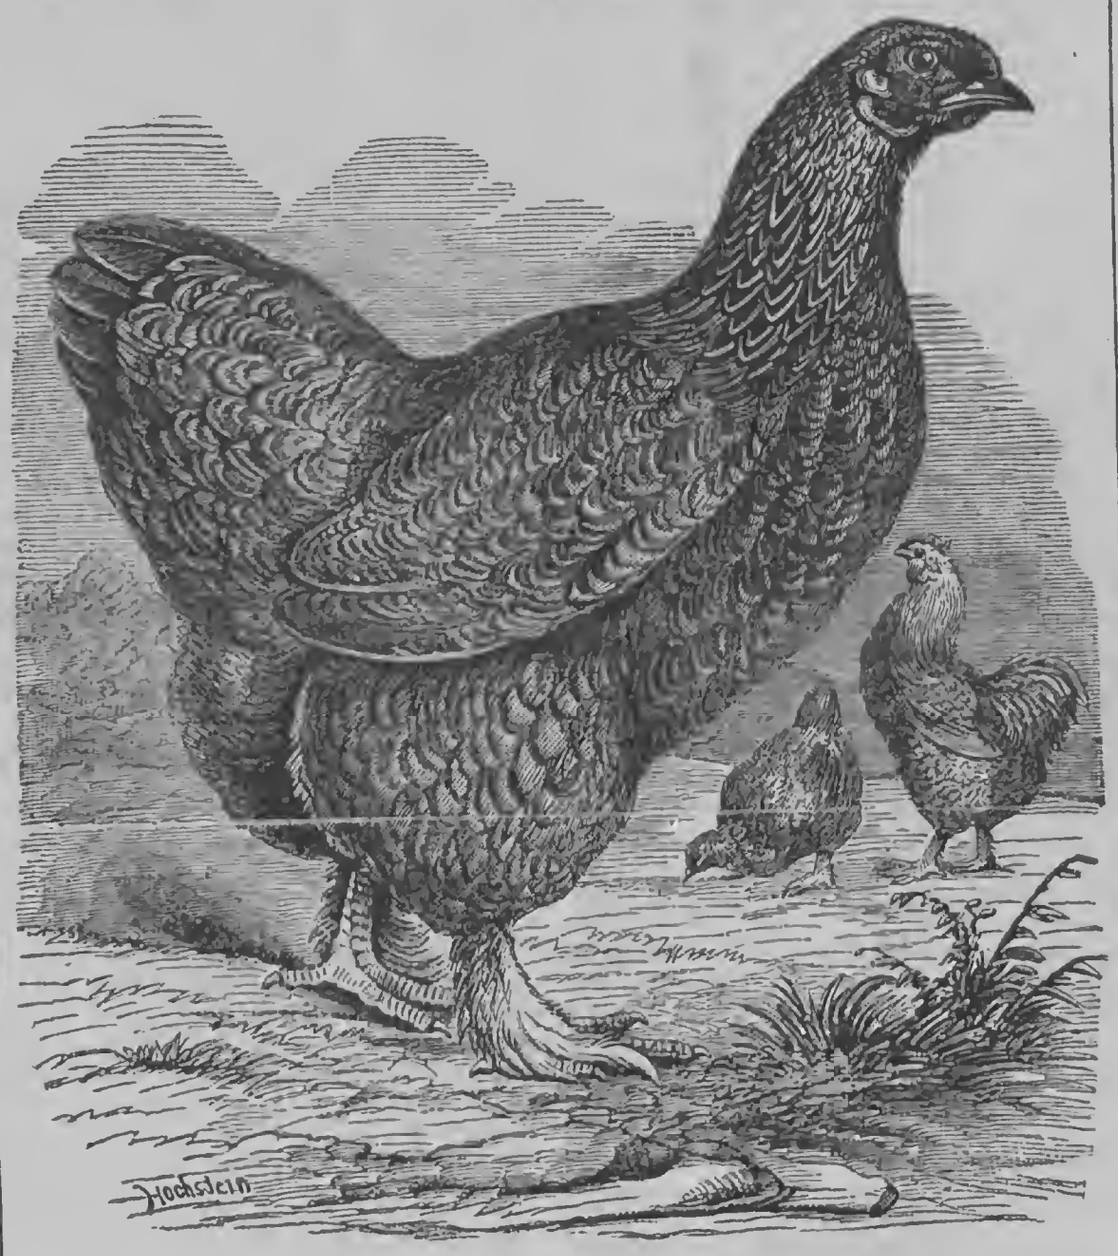

Fig. 1.—DARK BRAHMA HEN.

DOMINIQUES.

In Fig. 3 we give the portrait of a Dominique cock, an elegant bird, the representative of a most excellent breed of fowls. Very little is known of this breed abroad, it being of American origin.

The prevailing color is a light ground, undulated and softly shaded with slaty blue all over the body, forming bands of various widths. The comb is variable in the males, in some single, in others double; the greater part, however, are single. Feet, legs and bill are of a yellow or buff color. The hens are good layers and excellent mothers, and taking the breed upon its numerous merits, we have few, if any, better for the farm generally.

CENTENNIAL POULTRY SHOW.

CAN you tell me anything in regard to the "Centennial Poultry Show" prizes. I have watched the papers to see who won first prize, but can learn nothing in regard to it. A reply will confer a favor on—MILTON, *Seneca Falls.*

ANS.—Our correspondent proposes a conundrum which we will have to "give up." It is, as DUNDREARY says, "One of those things which no fellow can find out." All sorts of rumors are afloat in regard to the matter. One says that every chick, fowl, pigeon, duck, turkey, etc., is to receive a bronze medal, and that several immense establishments are now running night and day, busily engaged in preparing them. Another rumor indignantly denies this, and says that only those birds not disqualified are to receive bronze medals, and those disqualified are to be "highly commended." Still another rumor declares that the poultry awards are to be similar to the now famous piano awards—that each exhibitor will receive a medal, accompanied by a report from

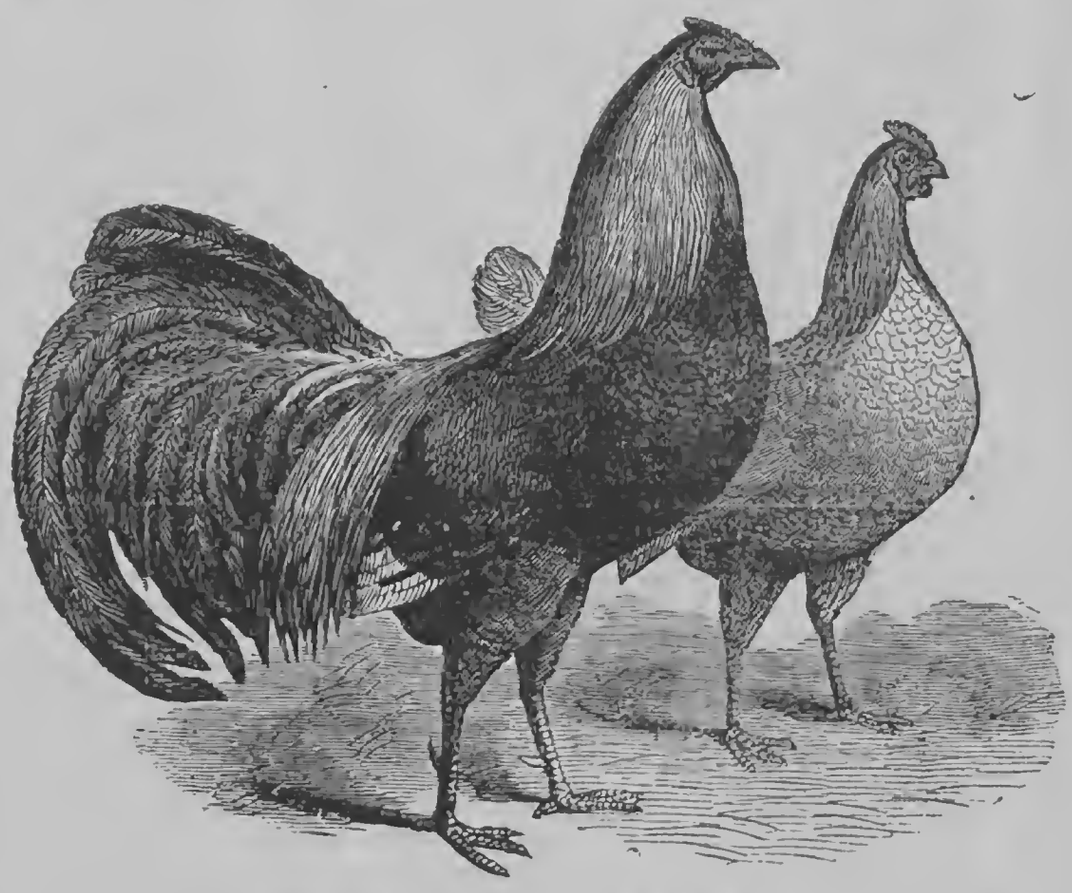

Fig. 2.—DERBY GAMES.

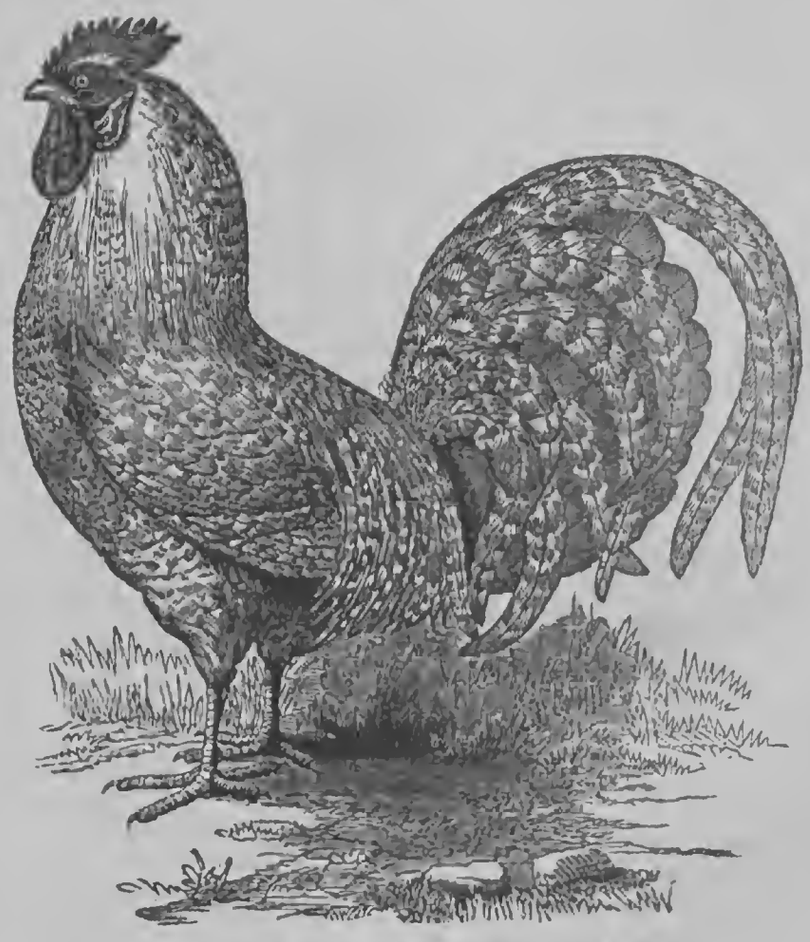

Fig. 3.—DOMINIQUE COCK.

the Judges, intended to show which is considered to be best in its variety.

But on the "please everybody" plan of the piano awards, these reports are to be worded so nicely that no one can find out who has the "first medal." Thus: John Smith's poultry receive a medal," for purity of tone and delicacy of touch," while John Jones' poultry will receive a medal for "excellence as a Concert Grand, peculiar singing quallly, and finish in workmanship." This may seem to John Jones and Peter Smith very much like a report on a piano-forte, but we believe that it is about as applicable to the subject as the Judges' report will be, from all that we learn.

QUERIES ABOUT POULTRY.

I WANT to ask a few questions that may seem unimportant to "fanciers," but an answer will much oblige one who is not posted on chicken breeding, but is, nevertheless, interested in the matter, and has purchased some stock with which to begin poultry raising:

1st. What should be the diameter of the roost for full-grown chickens; should it be smooth and round, or rough and square?

2d. Are scraps from the table good for chickens, or is it best to keep them on corn?

3d. How large should a nest be and how made? —JOHN A. NORRIS, *Middletown, N. Y.*

ANS.—Our correspondent is indeed "beginning at the beginning," in asking advice as to the roost, the nest and diet; but, simple as seem these questions, they are the essence of success in his proposed project.

1st. About four inches in diameter is the best size for a roost for ordinary fowls. If the variety you keep is small, of course the roost should be small in proportion. It is not best either "smooth and round," or "rough and square." Let us compromise it by making it "rough and round." A rough pole with the bark on makes a capital roost, as the fowls cling to it better, and seem to prefer the bark to planed wood. Do not have your roosts too high, as large fowls will injure themselves, at times, in flying down. Do not have one roost above another, or there will be a mighty fight for highest place.

2d. Scraps from the table are excellent for your poultry, and if you have but a few fowls, these scraps should almost entirely support them. A corn diet will make your hens so fat that they will cease laying.

3d. About eighteen inches square is a good size for a nest. If made of wood, have no bottom to the box, and placing it on the ground, let the hen make her nest on the turf. A wire basket, made flat on one side, and hung by a nail to the wall, is an excellent nest, and one that will be always free from vermin.

DOUGLAS MIXTURE.

WILL the RURAL oblige me by telling me what "Douglas Mixture" is, and for what purpose it is used. I see it advertised in a prominent poultry journal. Is it a "patent medicine?" —J. A. WILSON, *New York.*

ANS.—"Douglas Mixture" is not a "patent medicine," and we give, below, its ingredients. It is a bracing tonic, composed of sulphate of iron and sulphuric acid, and will be found an admirable assistant to the poultry keeper in guarding against "roup," in strengthening chickens in their molt, and in preparing them for "shows." It gives a bright red color in the ears and comb, and adds much to the appearance of birds in the "show pen." About a tablespoonful should be added to every quart of drinking water provided for the fowls.

"Douglas Mixture" is composed of half a pound of sulphate of iron, and one ounce of sulphuric acid dissolved in two gallons of water.

CONGESTION.

YOUR correspondent who, in a late number of the RURAL, complains of the loss of so many of his ducklings without knowing the reason for their peculiar troubles, may attribute them very probably to *over feeding* and consequent *congestion.*

The writer, some months ago, had a similar experience with a Leghorn hen, and gave the result of his treatment in an article which was published in the Country Gentleman at the time. A stream of cold water, frequently applied to the head, a liberal dose of blue mass, followed next day by castor oil and a very light diet for several days will, I believe, remedy the evil, while reduced rations of wheat will prevent any from being attacked. L. J. W.

Arkadelphia, Ark.

DURHAM POWDERS FOR FOWLS.—Please allow me to recommend to Mr. E. A. the Durham Powders as a cure for sick ducks or fowls of any kind. Mix in corn-meal dough or wheat bran until it becomes red with the powder. Feed to fowls once or twice a day for several days, and they will soon recover. As a preventive, feed the above mixture every two or three weeks to your fowls and they will keep in perfect health.—M. E. B., *Mosen, Tenn.*

Dairy Husbandry.

THE ENGLISH CHEESE SHOWS, AND HOW THEY PROMOTE DAIRY PROGRESS.

THE English plan of "after-dinner" speeches at the great cheese Fairs, it seems to us, is a valuable feature of the Exhibition, and one which could be profitably introduced on this side of the Atlantic. The course pursued is something after the following fashion:

When the awards have been made, the judges, the exhibitors and others interested in dairy matters sit down together to dinner, and after this is disposed of, speeches are called for in reply to toasts which are given in reference to the occasion. The judges are expected to give a full account of their reasons for making the awards, to point out the merits and defects of the cheese and butter on exhibition, and to make suggestions in regard to the style and quality of such goods, as may be demanded in the various markets. The merchants are expected to discourse concerning the trade, reviewing the markets in the past and giving their views in regard to the probable state of trade in the future. Dairymen and those interested in the making of dairy products discourse upon facts connected with the business in different sections, the health of stock, the condition of pasturage, the yield of milk, etc., etc. Thus, it will be seen, a large amount of valuable information is brought out and mutually interchanged.

Some such plan, we think, should be introduced here—not that a formal dinner is indispensable, for this is an English custom, and "after-dinner speeches" are supposed to be free from rancor, as every one wishes his neighbor well and tries to promote his best interests. We are not sure, therefore, but that there is wisdom in the plan of discussing all these matters after the appetite has been fully satisfied; but the important point we wish to urge is, that a meeting of those interested should be held in connection with the Show and immediately after the awards, so that exhibitors, judges and merchants might meet together and exchange opinions. It is worth something to an exhibitor to get the opinion of a judge, if the latter be an expert. We cannot always see defects until they are pointed out, and especially is this the case with dairymen in regard to dairy products, the impression generally prevailing that each makes the best goods.

We have before us a late copy of the Somerset and Wilts Journal which gives a very full account of the great Cheese and Butter Show at Frome, Eng., from which we obtain some useful information in the speeches of the judges after the annual dinner. We give below a brief abstract of some of the facts brought out:

ENGLISH CHEESE IMPROVING.

Mr. COPEMAN, one of the judges, in referring to the difficulties in making the awards, said they had done their best on this occasion, but their difficulties had been increased by the improved quality of the dairies they had to inspect. That was a satisfaction to the gentlemen who exhibited, and he referred to it with pleasure. Having been one of the judges two years ago, he could see great improvement in the cheese this year, as compared with that time. Some time ago he began to feel a little nervous about the standing of the English dairy farmers. He was afraid they were going back and not maintaining their position as the makers of the *finest cheese in the world.* He thought the finest cheese in the world was made near that very spot (Frome).

AMERICAN CHEESE FROM AN ENGLISH POINT OF VIEW.

They had all heard a great deal about America, and it was necessary that they should keep their eyes upon that country. The importations of cheese last year from America were 50,000 tons, varying from a good medium to a good fine cheese; but there was no cheese from America equal to the cheese made in the neighborhood of Frome. America would have difficulty in competing with the finest qualities of English cheese, and this was a cause of encouragement. But he would warn those farmers who could not make good cheese to give up making it; if they continued to spoil good things, it would ultimately spoil them. The demand for the best cheese was three or four times more than they could supply. Many persons went without cheese altogether because they could not get the finest quality.

These remarks of Mr. COPEMAN concerning the demand for fine cheese are undoubtedly true, so that American dairymen need not have any fear of over-production in this character of goods for a long time to come, at all events.

Mr. C. remarked, in conclusion, that he did not propose to tell them how to rectify errors in manufacturing. His business was to point out the cheese that would command the highest price, and he advised those who could not make good cheese to get their neighbors to communicate the secret to them.

Mr. LIVESEY, another of the judges, said that though he had written a great deal upon cheese-making in the last twenty years, yet, when he attempted to speak, he was unable to do justice to the subject. No doubt many exhibitors of cheese thought themselves better judges than those who had adjudicated the prizes. Some farmers, having selected the choicest cheese of their dairies, were no doubt disappointed at not receiving a prize. He had known a case where the handsomest cheese made in a dairy turned out to be the worst, and actually fetched from 10 shillings to 15 shillings, sterling, less per cwt. than the bulk of the dairy. There were many things necessary, in the eye and judgment of a person of forty or fifty years' practice, to constitute a really fine cheese. A cheese might be very handsome outside and very deficient inside. It might lack flavor, be too hard, too dry, or too sloppy; it might be a cheese that would not keep, and it might have other defects.

WHAT CONSTITUTES A FINE CHEESE.

To constitute a really fine cheese, the cheese must be solid in texture, but "very sinking" and soft; the flavor should be as fine as possible. It should have mildness without insipidness, but a mildness that was full in the mouth.

ORDINARY AND FINE CHEESE COMPARED.

In remarking upon the markets, Mr. LIVESEY said that for the last six months cheese had been selling at low prices and trade was bad. But while the low samples had gone down from 20 shillings to 30 shillings, sterling, per cwt., the *best cheese had not gone down one shilling.* While cheese warehouses had been full of low-priced produce, there had been an *excessive demand for fine cheese.* If they taught their neighbors to make fine cheese, they need never fear for the demand.

TRAINING-SCHOOLS SUGGESTED.

It had been suggested that training-schools be inaugurated, where persons could serve an apprenticeship to cheese-making. A meeting with that object was to be held in London. If that plan could not be adopted, he would suggest the plan of the late Mr. JOSEPH HARDING of Marksbury, which was that the most noted cheese-makers take pupils. By this means the cheese-making of Scotland had been revolutionized. Twenty years ago the dairymen of Scotland made the worst cheese in the world, and now they challenge the Somerset dairymen to come up and compete with them.

Thus it will be seen how useful these occasions are made, when the most noted experts—men having forty or fifty years practice in handling cheese—give their opinions in reviewing their work in the presence of exhibitors, and the exhibits still near-by, to which an appeal can at any time be made.

The cheese Shows of the United States are faulty in this, that men are chosen as judges who are not experts, and who have but a limited knowledge of cheese in all its different grades and qualities. They make their awards without responsibility. They are not brought face to face with exhibitors and with merchants dealing in cheese, where they may be questioned as to their awards. Again, if all parties exhibiting are to be largely benefited, the merits and demerits of the samples shown must be pointed out. In this way real progress is made and a Cheese Show becomes something more than a mere scramble for awards, where favoritism and outside influence have as much, and often more, to do in distributing prizes than true merit. For this reason we think something can be learned from the mother country in the management of Cheese and Butter Shows, and the example is worth following.

GOING INTO WINTER QUARTERS.

THERE is scarcely any time during the season when dairy stock require more special care and attention than now, as the herds go into winter quarters. It is the habit of a large majority of dairy farmers in New York, as well as in some other States, to keep up the milking through December. Of course some of the animals will cease to yield milk during November, and very poor cows, perhaps, earlier. But the best cows, for the most part, will not go completely dry until the first of January.

As cold weather approaches, cows in milk ought not to be left exposed to storms. They are very sensitive to cold at this season of the year, and if left exposed to rains and to storms of sleet and snow, they not unfrequently contract disease, which, with the drain of milk, reduces flesh and seriously impairs their usefulness another season. We have seen animals in good health utterly ruined by a day's exposure to cold and drenching rains. On the approach of storms, the cattle should be immediately housed, and care should be taken that the animals on the outer edge of the stable should be kept from cold drafts of winds.

Another point of very great importance at this season is *generous feeding.* It is the custom with some to use up all the coarse and inferior fodder at the commencement of cold weather. This is a great mistake, as the best food should be given when the animals first go into winter quarters. After they have been dried of their milk and later in the season, the poorer food should be used, and as animals, like persons, enjoy variety in their diet, the coarse and less nutritious fodder can, by judicious feeding from time to time, be used up to the best advantage. But if the mows have been topped off with late ends of meadows and with the poorest fodder grown on the farm, then it may be necessary to feed this first. In such cases the animals should have an additional ration of ground grain-bran or ship-stuffs to make up the deficiency in nutriment in the poor fodder. It is very bad policy to allow milch cows to lose flesh at the commencement of winter. As a matter of economy in feeding, it is better to keep the animals in a good, thrifty condition at this season, because a thin cow requires more food than when she is in flesh, and if she is stinted and kept thin during winter, she will be of but little account for milk the following season. If fodder is scarce and it is necessary to economise with short rations, let the time be put off until late in winter or in spring.

Cows are often milked too long in the season. Some dairymen milk all winter and nearly up to the time of calving. This is a very heavy draft on the constitution, and unless the animal has an extraordinary amount of vigor, she breaks down early in life, or fails to yield a full supply of milk. It has been claimed by some, and perhaps with reason, that by a continued practice of long milking abortion is induced. When this bad habit becomes fastened on a herd it proves a terrible scourge, and the damage not unfrequently eats up the entire product from the herd.

It seems more in accordance with nature that animals should be allowed a reasonable time from yielding milk in order to recuperate and make up the wastes of the system, so as to produce healthy offspring and be in condition to yield a full supply of milk the following season. From ten to twelve weeks are none too long, it seems to us, for a cow to go dry, and we think, where cows are allowed this time, they will yield better returns than where they are milked up to near the time of calving. There are cows which do not readily dry of their milk, and of course such will require to be milked later; but these are exceptional cases. In conclusion, we say to dairymen: Look well to your stock at this season, provide warm quarters, shelter from storms, and, above all, give generous feed.

BRITISH DAIRY FARMERS' ASSOCIATION.

OUR London (Eng.) correspondent, under date of Oct. 28, sends us a list of the officers elected at the recent inauguration of the "British Dairy Farmers' Association," as follows:—President, J. G. Crompton of Derby; Treasurer, James Adams of Bishop's Stortford; Secretaries, H. F. Moore and Morgan Evans. The following are the names of the Committee:—G. L. Allender of London, Joseph Aston of Cheshire, John Coleman of Derby, James Dumbrill of Sussex, W. Livesey of Lancashire, R. Porteous of Somerset, John Rafferty of London, J. P. Sheldon of Derby, E. T. Tisdale of Kensington, John Whittaker of Highgate. The temporary officers of the Association are at No. 13 Salisbury Square, Fleet St., London.

The subscription fee has been fixed at 10s. 6d. per annum, in order that small farmers may be induced to become members. It is stated that the Association has now many members who have subscribed large sums.

We are glad to learn that a British Dairymen's Association is now established on a substantial basis. That it will prove a success and be of great benefit in promoting improved dairy husbandry in Great Britain, there can be no doubt. The names of the officers, several of whom have a wide reputation from their connection with dairy matters, are a guarantee that no effort will be spared to make the Association do an important work for English dairy farmers.

It has been suggested that the inauguration of dairy associations abroad and an improvement in dairy manufactures will have a tendency to injure the dairy interests of America, and that, therefore, we ought not to favor any such movement. This is certainly a very narrow view of the question, and we believe it to be entirely erroneous. There is great need of improved dairy husbandry in America, and improvement abroad will be likely to stimulate our dairymen to renewed efforts for excellence in their calling. It should be borne in mind that a common and low grade of dairy goods does not pay the cost of production, and the sooner we stop making such goods the better, not only for the producer, but for the merchant and the consumer.

The idea that consumption is increased by a low grade of cheese and butter at low prices is a mistake. Consumption is increased by making

the article more palatable. It is hard to induce people to eat a poor thing revolting to the taste, even though it be cheap, while, on the other hand, the more delicious an article is, the more it becomes a necessity in larger quantities and at comparatively higher rates. We have an illustration of this fact in the enormous quantities of butter consumed since the establishment of creameries, which have placed a better grade of butter before consumers than that formerly made at farm dairies. If any one doubts the assertion, let him note the difference in time which it takes his family to consume a 50-pound package of poor stuff (rightly named grease), and the same number of pounds of a fancy article, nice in texture and full of delicious aroma.

It is with this hope of improving the dairy products of the world that we hail the inauguration of a British Dairymen's Association, and we firmly believe that its influence for good will be felt in America. We shall look forward to the first Convention of British dairymen with interest, and shall be very much disappointed if we do not find something in the addresses and discussions which will be of value to the dairymen of America.

The Herdsman.

PARASITIC LUNG DISEASE IN CALVES.

It has long been known that there are parasites which infest the air passages and also the lungs of various animals. The one best known which infests the lungs of calves is the *Strongylus Micrurus*, a small worm one-half to one inch long. The presence of this parasite is not readily determined as the symptoms at first are very similar to those of an ordinary cold, and the stock raiser may not be able to detect the difference until too late to be of service to the animal. These parasites appear to be confined to no county or climate but exist among domestic animals everywhere.

In a late number of the Agricultural Gazette a veterinarian in speaking of the parasites says that the symptoms of the affection are not well marked in the early stage; auscultation furnishes absolutely no evidence of the disease, because the mucus rale which is heard, is common to all affections of the lungs in which the secretion from the lining membrane of the bronchial tubes is increased. The most characteristic symptom is a peculiar, dry, husky cough, which is so constantly present that the term "husk" is used to distinguish the disease. Sometimes the mucus discharged from the nostrils contains the eggs and embryos of the worm (*Strongylus micrurus*), and now and then full-grown worms are coughed up: but the fact of their close resemblance to a piece of white thread accounts for the little notice which is generally taken of them. After a few weeks the calves begin to fall off in condition, the cough becomes more troublesome, and some of the weakest animals die. The nature of the disease may be determined by post-mortem examination: on slitting up the tubes of the lungs they are found to be filled with strongles, often twisted together like a quantity of tangled thread; possibly the full-grown worms may have been expelled before the death of the animal, in which case the examination of the mucus of the bronchial tubes will always settle the question, as numerous eggs and young worms are certain to be discovered. In proportion to the strength of the calf will be the duration of the disease. The parasites only remain for a certain time, probably two or three months, on the bronchial tubes, and if the young animal has sufficient stamina to resist the debilitating effects of the constant irritation which the worms cause, there will be a satisfactory termination, but in many instances death occurs from exhaustion; and if from want of appetite or from bad quality of food, nutriment is not supplied in sufficient quantity, the deadly influence of the parasite is more marked. Treatment of the parasitic lung disease includes first, good nursing, the cattle should be removed from the pastures where they contracted the disease, and where they are liable to a constant introduction of parasitic germs, and be placed in a sheltered position. As to food, any nutritive material which will tempt the appetite is good for the animal.

Various medicinal agents have been used, with doubtful success—oil of turpentine is certainly the most effective medicine which has been tried. An average dose is a table-spoonful mixed with the yolks of eggs well beaten. The quantity may be given daily in the worst cases, but the majority of the animals will not require more than three doses a week.

Indications of the beneficial action of the medicine will be seen in the improvement of the appetite and condition, and the diminished frequency of the cough. The advance, however, even in cases which are treated successfully, is very slow, and the animal remains in an emaciated state for a considerable time. Inhalation of chlorine gas, the vapor of carbolic acid, or the fumes of tar, are advocated by some, but these modes of treatment are rather hazardous; no objection can be offered against the plan of driving the diseased animals about a shed, the floor of which is covered with powdered quicklime; the dust causes coughing, and thus leads to the expulsion of many worms, while others are destroyed in their habitat by mixture of the lime dust with the mucus secretion of the air-passage. There is no objection to the use of iodide of iron in doses of 10 grains every second day, as a tonic; but we have not found tonic treatment to be necessary when the means used to destroy the worms have been successful.

CATTLE DISEASES IN THE EAST.

An outbreak of Oriental Cattle Plague occurred on April 29th, 1876, at Szorney, and was extinguished on May 9th: the disease attacked twenty-one animals, of which ten died, six were slaughtered, and five recovered; the prompt stamping out of the disease is attributed to the rapid application of the laws of 1874. Cattle plague after breaking out in several villages of the Jaffa plain is now subsiding. The disease is said to have been imported into the district by a tribe of Bedouins, among whose cattle it was prevalent. An outbreak of cattle plague has taken place at the quarantine station Novosiollza. In consequence, all cattle now there and all which shall be admitted will have to submit to a quarantine of twenty-one days.

Pleuro-Pneumonia.—No fresh cases of this disease have appeared at Berne, where the outbreak took place last month, but as a precaution the animals in the shed at the time of the outbreak have been destroyed; but it has appeared in a new district in Lucerne.

The Horseman.

DO HORSES REASON?

Here is a good story about a horse, which is told in the Boston Journal, and we presume many of our readers could tell as good a one if they would only take the time to write it out for publication. Such notes on animal instinct or reasoning powers are always interesting to old and young:

It would be difficult to convince some people that horses and dogs are possessed of reasoning powers, and as difficult to convince others, who fondly love these animals, that they are unable to reason from cause to effect. A story comes to us, well vouched for, which will at least interest the reader, if not convince him that horses are possessed of more of the human attributes than many people are wont to credit them with.

Among the many horses owned by the Highland street railroad company, is one which used to give the hostlers a deal of trouble by slipping his halter and roaming at will about the stable. The halter was, on each occasion, buckled on as tightly as possible, but to no purpose, for the horse would invariably be found half an hour afterwards making a dignified tour of the stable. This became monotonous to the hostler, and he determined to ascertain the modus operandi by which his equine friend secured his liberty. Again the halter was tightly buckled on, and, taking a seat where he could watch his troublesome charge, he awaited developments. Pretty soon a horse which stood beside the troublesome one was observed to poke his nose into his neighbor's stall, and catching the end of the halter strap between his teeth, he pulled at it. His first, second and third attempts to unloose the buckle were unavailing, but with a perseverance remarkable even in a man, the horse returned to his work repeatedly, and finally out dropped the buckle-tongue, the throat-strap fell, and the horse of inquisitive mind was soon stalking about the stable again. A change of location was of course a necessity.

A large, homely, piebald gelding, owned by this company, used to manifest a strange regard for a white mare he formerly worked beside. In the stable he was hitched with a rope halter, and until a chain was substituted, he used to gnaw off his halter, march deliberately to the stall occupied by his mate, and squeeze himself into the stall, which was only large enough to accommodate one horse comfortably, and a great deal of effort was required to separate the equines after they had become wedged in so closely.

The interest in speedy horses among the Russians has been in the ascendency for several years past. As in many other branches of industry, in the breeding of stock, they bid fair to become formidable rivals to many of the nations who have, in times past, gazed upon them with considerable contempt. The great English Jockeys should begin to look to their laurels.

Scientific and Useful.

SOMETHING ABOUT THE SUCTION PIPE.

About three centuries and a half before the advent of Christ the versatile mind of Aristotle was led to investigate the marvels presented by the action of the syringe, water-bellows, siphon and other primitive hydro-pneumatic contrivances. "Nature abhors a vacuum," was the epigrammatic dictum of the prince of philosophers in explanation of the phenomena. The saying had all the essentials for ready and lasting acceptance. 'Twas poetically figurative, had an attractively scientific ring, yet was easily explainable, pleasantly shelved one mystery by substituting another, but above all it was conveniently short and axiomatic. Accordingly for about two thousand years, it was received, even by the learned, as clearly solving the problem it only confused, and even to-day it often drops glibly from the lips of many a pretentious dunderhead equally ready to sham knowledge by quoting the formulas of exploded errors, or by prating about the laws of modern sciences with whose formulas alone the charlatan has even a chance acquaintance.

About a hundred years after Aristotle's death, Ctesius of Alexandria, invented the valve pump; and straightway the Stagirite's maxim offered an explanation of the action of this novel contrivance. This consisted of two single-acting solid pistons moving up and down in two vertical cylinders having bottom valves only. The discharge pipe, furnished with an outgoing valve, was placed between the piston and the valve-seat, so that this original device differed but little from some of our modern force pumps. The next two thousand years were nearly wasted, so far as concerned either improvements in pumps or the attainment of a more correct conception of the philosophy of their working. The insertion of a valve in the piston-head and the location of this below the discharge pipe were the chief improvements, and adapted the pump for lifting as well as suction, but meanwhile Aristotle's dictum had acquired the sacredness of a dogma.

The mighty revolution of the 16th century, however, was an upheaval of philosophical as well as theological superincumbent creeds, and the venerable theory of pumping was soon subjected to irreverent scrutiny like other doctrines. In 1641 there was set up in the Grand-Ducal water-works, at Florence, a pump whose suction-pipe extended nearly sixty feet above the surface of the reservoir. Despite its honorable location, repeated trials failed to raise water in the tube to a greater hight than about 32 feet. The superintendent of the water-works appealed to his fellow-citizen Galileo to account for this liquid obstinacy. Totally blind and nearly deaf, persecuted, eighty and morbund, the venerable philosopher could only say, impromptu, that Nature's abhorrence of a vacuum must be inoperative above the hight of 32 feet. A few months later he died and his disciple and amanuensis Torricelli continued to investigate the problem whose unstudied solution by his friend must have been unsatisfactory even to that friend himself.

Hitherto the belief in vogue, even among scientists, had ascribed the ascent of water in an exhausted tube to a mysterious property in nature, somewhat analogous to that of the loadstone or gravity. This resisted all attempts to make a vacuum with the same force it employed to destroy it when made by urging the next substance, if a fluid, into the void it abhorred. Analogously suction was regarded as an occult faculty of the mouth that attracted liquids to it independently of any extraneous influence.

It was not until 1643—two years after Galileo's death—that Torricelli exploded these venerable errors by demonstrating that atmospheric pressure was the motive force in both cases, and that pulsion, not traction was the method of its action. Having, by dint of his own reasoning or at Galileo's suggestion, reached the conclusion that the hight to which water rose in an exhausted tube depended on the relative weight of the aqueous column inside the pipe, and that of the aerial pressure on the water outside of it, it occurred to him that the truth of this theory would be demonstrated if a column of another liquid, the specific gravity of which was known, were sustained in a tube at a hight proportioned to its gravity. Mercury is a trifle over 13½ times heavier than water; the length of a column of this metal therefore, sustained by atmospheric pressure in an exhausted tube, would be somewhat less than 13½ times that of a column of water under similar conditions. At the sea level, in fair weather, atmospheric pressure amounts to about 15 pounds to the square inch. This is equal to counterbalancing a column of water of the same diameter about 33 feet high, and Torricelli, by a very ingenious experiment, proved that it could also sustain a column of mercury about 29 inches in hight; and thus demonstrated the truth of his proposition.

This discovery, which opened the way to scientific researches extending far beyond the special question that had originated it, met with the acrimonious opposition which always confronts all exposures of the cherished errors of mankind. The most ingenious objection urged that Nature's abhorrence of a vacuum extended to mercury as well as to other fluids, and that Torricelli had merely discovered that the force of this abhorrence varied with the specific gravity of different liquids. Four years later, just one year after Torricelli's death, this objection was clearly refuted by Pascal—the celebrated French mathematician and divine—who had verified and varied Torricelli's experiments.

As the lower strata of air support the weight of all those above them, Pascal argued that atmospheric pressure must be greater at the foot of an elevation than at any point in its ascent, and consequently that the length of a fluid column, if really counterbalanced by this pressure, must be less at the top than at the bottom of a mountain. This crucial test was made with mercury in 1648, on the Puy de Dome, the highest mountain in France, and was decisive of the correctness of Pascal's inference and Torricelli's discovery. The school-boy of today smiles at the scientific ignorance of the philosophers of earlier ages, of the accumulated results of whose genius and labors he is the thoughtless inheritor, and even the omniscient school-girl seldom dreams of the vast amount of talent, research and experiment needed to explain correctly the working of so simple a thing as the suction pump.

A CHAPTER ON GAS.

"New York," says a writer, "burns about 1,200,000,000 cubic feet of gas per annum; Chicago, 400 000,000; St. Louis, 250,000,000; Cincinnati, 400,000,000; Pittsburg, 200,000,000; San Francisco, 250,000,000, and Baltimore, 400,000,000."

"How do they make gas?"

"First they put about two bushels of bituminous coal in a long air-tight iron retort. This retort is heated red hot, and, of course, the coal is heated red hot, when the gas bursts out of it, as you see it burst out of lumps of soft coal when on the parlor fire. The gas passes off through pipes. A ton of coal will make 10,000 cubic feet of gas. The gas as it leaves the coal is very impure."

"How do they purify it?"

"First, while hot, it is run off into another building; then it is forced through long perpendicular pipes, surrounded with cold water. This cools the gas, when a good deal of tar condenses from it and runs down to the bottom of the perpendicular pipes. This tar is the ordinary tar which you see boiling in the streets for walks and roofs.

They now wash the gas. They call it scrubbing it.

This is done by filling a large vessel, which looks like a perpendicular steam boiler, half full of wood, laid crossways. Then ten thousand streams of cold croton water are spurted through this boiler. Through the mist and rain, and between the wet sticks of wood, the gas passes—coming out washed and cleansed. The ammonia condenses, joins the water, and falls to the bottom."

"What next?"

"Well, next the gas is purified. It is passed through vats of lime and oxide of iron, which takes out the carbonic acid, sulphureted hydrogen and ammonia."

"What next?"

"The gas is now pure. It is passed through the big station meter, then through the mains and pipes, till it reaches the gas jet in your room. Then it burns, while you all scold because it don't burn better."

EXCELLENT INTEREST RULES.

For finding the interest on any principal for any number of days. The answer in each case being in cents, separate the two right hand figures of the answer to express it in dollars and cents:

Four per cent.—Multiply by the number of days, and divide by 72.

Six per cent.—Multiply by the number of days; separate the right hand figure, and divide by 6.

Eight per cent.—Multiply by the number of days, and divide by 45.

Nine per cent.—Multiply by the number of days; separate the right hand figure, and divide by 4.

Ten per cent.—Multiply by the number of days, and divide by 35.

Twelve per cent.—Multiply by the number of days, separate the right hand figure, and divide by 3.

Fifteen per cent.—Multiply by the number of days, and divide by 24.

Eighteen per cent.—Multiply by number of days; separate right hand figure, and divide by 2.

Twenty per cent.—Multiply by the number of days, and divide by 18.

Industrial Implements.

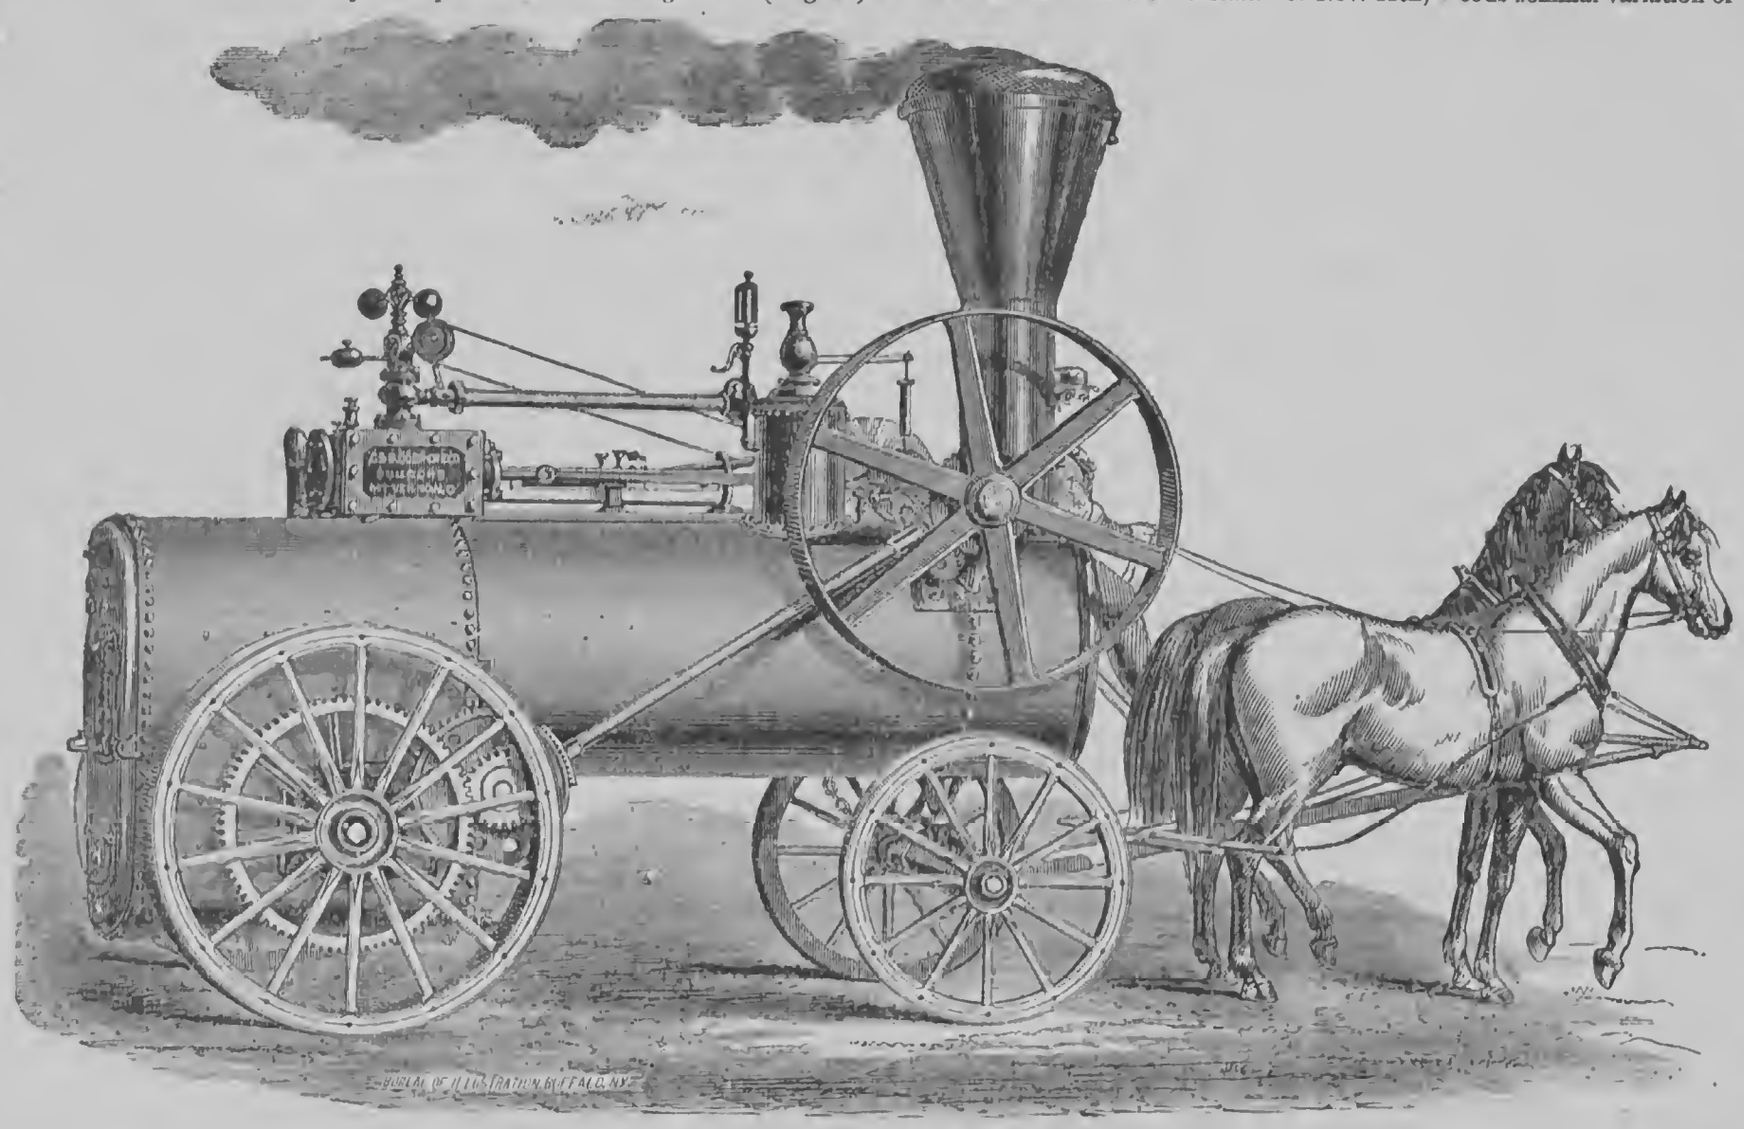
A NEW TRACTION MOTOR.

THE illustration given herewith shows the application of a new invention of Mr. GEO. ROGERS to the portable engines made by the well-known Mt. Vernon Iron Works.

The attention of the agriculturist has been conspicuously directed to traction or road engines by the admirable work performed by the English machines at the Centennial. It becomes more and more apparent that they are the most economic farm engine that can be used, as they serve various purposes, at very little, if any, additional expense.

The cost of the attachment applied at present to the engines made by G. & C. COOPER & Co., Mt. Vernon, Ohio, is about $100.

Thresher men, farmers, and those who find it profitable to use portable engines would do well to examine the merits of this novelty. Full and complete information will be furnished by writing to the address given above. The Traction Engine can be used for such a variety of purposes that a strong point in its favor is the fact, that a man who owns a portable engine with this attachment can find work for it constantly.



A NEW TRACTION MOTOR.

WATCHES.

AMONG the many articles which have kept pace with the rapid march of improvement during the nineteenth century are watches. And with the advance in quality a proportionate reduction in price has been witnessed, so that this very useful companion is now much better and cheaper than in times gone by. Switzerland has always been celebrated as the watch-making nation of the world and does not fail even now to take advantage of all machinery and devices which may have a tendency to improve in this direction. The importation into this country of Swiss watches is something enormous as can very easily be learned by communicating with Messrs. QUINCHE & KRUGLER of 15 Maiden Lane in this city, where can be seen watches of every description from the cheap, but perfect time-keeper, to the best chronometer. About this season of the year, when people are casting about for a suitable Christmas present, no one could do better than to investigate the large and elegant assortment always to be found at the office of the above firm. One thing they can depend upon; they will get exactly what they buy and pay for, as the reputation of the firm sustains an assurance of that fact.

HOME HAND CORN-SHELLER.

THE "Home" Hand Corn-Sheller is a neat little contrivance that is admirably adapted for the purpose it is intended to serve. The need of a good hand corn-sheller has been apparent. No further proof of this is needed than the fact that Messrs. LIVINGSTON & Co. of Pittsburgh, Pa., have sold upward of 10,000 of their Sheller in the comparatively brief time it has been before the public.

This Sheller is compact, made of good materials, and when adjusted it works easily and is not liable to get out of order. Its makers unhesitatingly assert that it removes the corn clean from the cob without breaking the kernel. It adapts itself to large or small ears, and its capacity is from five to ten bushels per hour.

A Sheller which we saw in this city seems to corroborate the claims of the makers, and we would add that the "Home" has been distinguished by receiving a First Premium at the Tradesmen's Industrial Institute, Pittsburgh, 1875.

Those of our readers who are interested in poultry, or any agricultural pursuit, would do well to examine into the merits of the Sheller. The "Home" is sold either direct or through the medium of agents. The manufacturers will furnish information free.

IMPLEMENT TRIALS IN ENGLAND.

THE course of machine trials does not always run smooth even among our British cousins. By the report of a late meeting of the (English) Royal Agricultural Society, published in the Mark Lane Express, we learn that Mr. Jabez Turner reported the recommendation of the Committee that the gold medal of the Society be again offered at the Liverpool meeting for an efficient sheaf-binder, and that the ten silver medals be offered as heretofore. The Committee had made such alterations in the existing regulations as the adoption of this recommendation by the Council would render necessary. The Committee, in addition, recommended the adoption of the following new regulation: "Every protest against an implement, on the ground of an infringement of patent-right, shall be accompanied by a deposit of £25, which shall be returned in the event of the protest or action at law being decided in favor of the person lodging the protest; but otherwise the said sum of £25 shall be forfeited to the Society." This report was adopted after a conversation, in which a smaller amount of fine was suggested by Colonel Kingscote and other members of Council, while Mr. Amos urged that such a course would render the intention of the Committee inoperative, and if any fine at all was considered necessary, it must be one of a substantial sum.

He also reported that the Stewards had had under consideration the protest of Mr. Spencer, on behalf of the "Johnstone Harvester Company," against the self-delivery reaping machine of Messrs. Hornsby & Sons, worked in Class 1. at Heathcote Farm, for an infringement of patent rights. This protest having been received by the Secretary on the 19th August, and no satisfactory reasons having been assigned for the delay, the stewards were of opinion that it cannot be entertained, as the rules expressly provide that all protests must be delivered on the evening of the first show-day. The stewards had further to report that Mr. William Anson Wood removed from the show-yard two reaping machines, Nos. 551 and 552, which were entered for trial, and had undergone the preliminary examination of the engineers and judges. This was in direct contravention to Section 20 in the "general regulations." This report having been received and adopted, on the motion of Mr. Turner, the Secretary was instructed to write to Mr. W. Anson Wood for an explanation of the circumstances attending the removal of his reaping machines from the Birmingham show-yard.

THE Centennial Exposition Medal and Diploma of Merit have been awarded to H. W. JOHNS for Asbestos materials, among which are his improved Steam Pipe and Boiler Coverings, consisting of Asbestos-lined Hair Felts and Cement Felting; also, Fire-proof Paints for structural purposes, a Roof Paint of Superior quality, Asbestos Roofing, Cement, Steam-packing, etc., etc.

The Garden.

THE GREEN PROLIFIC CUCUMBER.

DR. HEXAMER'S REPLY—NO. 2.

THE statement in the "RURAL" of Nov. 11th, "that in the estimation of many who have tried the Green Prolific Cucumber, it is all that Dr. HEXAMER claims for it," is sufficient to require no further argument in its favor. But there are a few other points in the same article, which are of more general importance than the question as to which is the best Cucumber.

Is the Green Prolific Cucumber a "cross?" I say it is, and the RURAL is kind enough to consider this opinion a ridiculous assumption. Now I do assume that when one variety, grown near another variety of the same species, produces an offspring, which partakes of the characteristics of each variety, it may be asserted that the new seedling was produced by cross-fertilization and is therefore a "natural cross." This is exactly the case of the Green Prolific, and the fact, that it has retained its special qualities for fifty years gives additional proof of the correctness of the assumption. If a seedling so originated is not a "cross," what is it? It might possibly be a sport, but not more likely than that a Mulatto is a sport instead of a cross.

The care and attention given to an experiment can often be found out from its results, and so "did I find out" that the experiment in question was "careless and imperfect." When an experimenter expects to establish the yield of pickles from different varieties of Cucumbers, without picking and counting the pickles; and when he can not find any difference between a compact growing variety with dark orange skin, and one of rampart growth and a light straw-colored skin, I must consider the experiment "careless and imperfect," and no amount of argument can convince me to the contrary.

I am so well aware of the difficulties of experimenting, and how numerous are the causes which may lead to false conclusions, that I do *not* "feel justified in drawing any conclusions, from experiments, made under such unfavorable conditions, that their results can not teach anything. Of the experiments I made last season, with a large number of new varieties, I do most decidedly, hesitate to state conclusions." The season was so unfavorable to the development of vegetables that such a statement could benefit no one, while it would causelessly prejudice some and unjustly injure others.

No one can be more impressed with the importance and influence of the agricultural press than I, as well as of the difficulties, which, in the absence of public experimental stations, the editor must encounter at every step. It is for this reason that I consider it the duty of "every fair-minded person" to correct errors and mistakes wherever he finds them; not because the results of others' experiments do not accord with his own views, but for the sake of fairness and truth.

F. M. HEXAMER.

REPLY.—Dr. HEXAMER's assertion that the Green Prolific Cucumber was the result of certain crosses is not maintained by any demonstration. He admits that it might *possibly* have been a "sport." Then it is not *unquestionably* a cross between the Green Cluster and Long Green.

That a seedling plant should resemble both its pistil parent and another plant growing near, cannot be accepted as proof that the latter was the pollen parent. The possibility of spontaneous seminal variation or of bud variation would forbid. But were there no other Cucumber plants in the neighborhood? Is the Green Cluster or Long Green possessed of such marked qualities or characteristics that a seedling resembling either the one or the other must needs be the offspring of the one it resembles? Is it not possible that the finality of a careful selection through fifty years from *any* variety of Cucumber would differ as much from its original parentage as does the Green Prolific differ from its original parentage, whatever it may have been?

We have alluded only to the first supposed cross. The seedlings or seedling produced from this were again crossed with the White Spine. So, in the same manner, the Cucumber which, many years later was to receive the name of Green Prolific, was planted, we are to suppose, near the White Spine; and from the fact that subsequent seedlings displayed a resemblance to this also, the above conclusion was arrived at.

We do not know how many parents and grandparents a certain variety of Cucumber may be seen definitely to resemble by eyes schooled to the detection of Cucumber characteristics; but if they may be judged as are other monoecious fruits of *Cucurbitaceæ* or of other orders, even the most marked resemblances or distinctive qualities, of which the Cucumber is comparatively destitute, would not, as we have said, be accepted as positive proof of a first cross-bred or hybrid origin—much less of a second—supported by the solitary fact that the several varieties or species grew near to one another or even side by side. To weaken such a claim would be, first, the fact that the alleged cross-breeding occurred fifty years ago when cross-breeding and hybridizing were little known or practiced among the mass of horticulturists and, second, that whatever account of the origin of the Green Prolific we may now have, has been preserved during so long a period by word of mouth alone. At least Dr. HEXAMER makes no reference to any written or printed account of its origin.

We can not see how the fact that the Green Prolific "has retained its special qualities for fifty years, gives additional proof of the correctness" of Dr. HEXAMER'S assumption, if we are to credit another statement of his, viz., that it is "the result of *careful selection* continued for over fifty years." Had it retained so firmly its "special characters" there would have been little need of such careful selection. So much for its origin.

How many years would Dr. HEXAMER have us take to experiment upon the scores of "novelties" offered every season whether favorable or not before we should render our reports? Suppose last season had been as favorable for Cucumbers as it was unfavorable, and the Green Prolific had astonished us and Dr. HEXAMER too—would he censure us the same had we published results as observed in our grounds? Would our experiment then have proven "careless and imperfect" in his estimation? But such an account would none the less "unjustly injure" the purchaser of the seeds even though it benefited those who offered them for sale.

We shall endeavor, life spared, as far as possible to test all new plants or seeds offered every season let it be wet, dry, cold or hot, and, with every fair qualification to publish the results. Those whose products we can not view through the producer's eyes will, perhaps, pronounce them "careless and imperfect"—but unless they are as perfunctory as Dr. H's. dictum as to the origin of the Green Prolific Cucumber, we shall have little fear that we are not working "for the sake of fairness and truth."

Dr. HEXAMER may prove that we are incapable of distinguishing a dark orange from a light

straw-colored skin, or that, in a word, we do not know "beans" about Cucumbers, but his persistency in reiterating that our experiment was "careless and imperfect" strikes us as showing how great Cucumber men, like other specialists, may be too exacting in all that pertains to their specialty. Dr. HEXAMER says "no amount of argument can convince me to the contrary." Thus made aware of the impregnability of that fortress, we shall not attack it. But, conversely, "no amount of argument" can make *us* believe that our experiments were not tolerably careful—and nothing short of *evidence* shall convince us that the origin of the Green Prolific Cucumber was unquestionably what it is claimed to have been!

Thus it would seem that both Dr. HEXAMER and ourselves have arrived at very decided conclusions in which, we are afraid, our readers will experience a more stirring delight than they have felt in the controversy that has led to them. Finally Dr. HEXAMER need not think that we "consider his opinion a ridiculous assumption." We have no reason not to respect his opinion except in so far as he mistakes it as having the power to create and establish a fact.

It is the practice of proclaiming as positive knowledge that which should at most be assumed as probable, that we condemn—a practice that is not likely to insure for our accounts of the origin of contemporaneous varieties any great amount of respect from the horticulturists of the future.

CARTER'S GREEN GAGE TOMATO.

I HAVE found this an excellent variety, being rather earlier than Hathaway's Excelsior, and in other respects, except in color, very much like that excellent sort. My employers are very fond of it, considering the flavor, to be superior to other sorts. Two Canadian gentlemen who were here lately, told me it is grown extensively in America, under the name of the Plum Tomato. From my experience of it, it is to be recommended as an acquisition of no mean order.

We find the above in the Gardener's Chronicle of London. We do not know by what name it is known in Canada, but it is with us a novelty of last season, offered by one of our leading seedsmen, and known only as the Green Gage Tomato. We planted half a dozen hills of it and made the following notes:

Two tomatoes ripened August 15, the larger measuring seven inches in circumference. They were perfectly smooth, without a furrow and of the shape of an orange. Many of those ripening later were much smaller and of an oblong shape, from which and from the color—a bright yellow—the name, we suppose, was suggested. The smaller are excellent for preserving, the others very good either raw, cooked or for making catsup. All of them are firm, but two-celled and small-seeded. Trained upon a trellis this Tomato is quite ornamental after the fruit begins to ripen.

We may now add in favor of the Green Gage that it was less acid in flavor than were the other Tomatoes this season grown in the same grounds.

We would be glad to hear from any of our friends who have tried the Goden Trophy during the past summer. Mr. B. K. BLISS speaks of this latter as follows:

It is a sport from the well-known "Trophy," but is a stronger and more rapid grower, more productive, and ripens a week earlier, continuing until frost. The fruit is almost an exact counterpart of the Trophy in form and size, of a beautiful light yellow or straw color, occasionally faintly streaked with red: the flesh is very firm and solid, containing but few seeds. Its flavor is entirely different from any variety with which we are acquainted, being free from the strong "tomato" taste and fragrance which belong to most other varieties, having very little acidity, and when eaten raw without seasoning, resembling in flavor some varieties of apples.

THE THWACK RASPBERRY.—This is said to be a cross between the Herstine and Brandywine and superiority is claimed for it as to hardiness, size, shipping qualities, color and flavor. These claims, if we may judge from the testimonials of many well-known gentlemen who have tried it, are not unsupported by practical tests.

This Raspberry is said to be a stout, upright grower, the canes attaining a hight of but three feet without thorns and requiring no support. A. HANCE & SON, Red Bank, N. J., are agents.

The Vineyard.

GRAPE VINES IN WINTER.

MANY grape-growers in this vicinity, consider the laying down, and covering of grapes as useless labor. In fact, I notice the practice of leaving them upon the trellises is steadily growing in favor. The argument is that they do just as well after they once get "toughened."

I have not yet become converted to this practice, but protect my vines in the manner recommended in the RURAL of Nov. 18. Watching carefully the results in a number of cases where vines have had no protection; I am very confident that it is a losing practice, even if the others do not discover the fact.

Near me is a vineyard of four or five acres that has been left to this "toughening" process until the yield has decreased more than one-half. The owner gives other reasons for this decline in the yield, but want of protection in winter is (in my judgment), what ails his grapes.

One of my neighbors has his vines all trimmed and tied upon the trellises ready for an early start in spring, and he remarked, "Now I shall have less to do next spring than if my vines were buried." "Yes," I answered and you will probably have less picking and marketing to do, and there will be another saving of labor.

Grapes are often uncovered too early in spring and are seriously injured in consequence. It is evidently better not to cover at all than to uncover too early. In this, as in many other matters, it is wiser to "make haste slowly." Remember spring has not opened the first "sunny day." NELSON RITTER.

Syracuse, N. Y.

This theory of toughening plants and animals by exposure is one of the most absurd of all the fallacious ideas which ever entered the human mind. It is probably an off-shoot of what we may term "theoretical acclimitization" of plants and animals, the advocates of which have in times past, and even do at the present time, claim great things, but without one solitary instance of a change having been wrought upon any individual plant or animal in making it more hardy by change of climate upon which to base their claims. A tender plant will remain tender through all ages, no matter how handled, treated, or where grown, but by raising seedlings therefrom and judicious selections from among the same a variety or varieties may be obtained more hardy than the original stock or parent, and this is all there is of acclimation, of either plants or animals.

Taking this view of the subject, which we believe accords with all the experiments made for the purpose of determining the effect of acclimatizing, we can readily see how absurd it is to try to harden or toughen an animal or plant by exposure to cold. The Concord or any other variety of grape is just as hardy when first produced as it will be a hundred years hence, the only effect of culture being observable in the vigorous or feeble growth of the plant.—ED. RURAL.

Farm Economy.

EFFECTS OF IRRIGATION.

FARMERS in our Eastern States who suffered severe losses the past summer from the effects of drought, may take a hint from the following letter to a California paper (The Bulletin), and practice irrigating their fields whenever practicable. The writer says:

The irrigation has, during this season, made a wonderful effect both on soil and climate. The surface water has risen all over my land from 15 to 17 feet, and I now reach it at four to seven feet on any place on my land. By a thorough cultivation the moisture will rise to the surface the year round. This it did all the past summer and produced a heavy dew every night—not merely on the slough, where we have had water all summer, but a mile or two away, where there had been no water since last winter. Although there has been a good deal of disappointment regarding winter irrigation in this settlement, I am satisfied that has arisen from our ignorance of this, a new system of farming; and I am positive that it can and will be made perfectly successful as regards small grain, and will in the future have to be practiced, as during the winter we have always plenty of water, while in the spring it may possibly fail in some seasons, though we have no reason to expect it from our past experience. I irrigated a great portion of my land during the heaviest and coldest rain of last season, when my grain was very young; and I found that whenever I drained it immediately after the water had covered the surface, it was a success; but whenever I let it remain on the land 10 or 12 hours it injured the plant, or at least injured its growth and turned it more or less yellow. By having a system of drainage connected with the irrigation, winter irrigation must prove a success for small grain, and it should be practiced by every one so as to fill the earth up beneath with water when there is plenty. Nature has given us a hand in tree planting. Millions of willow and cottonwood plants have come up along the sloughs and ditches. Besides the future value in wood, this will undoubtedly aid in retaining moisture both in the land and the atmosphere. I have the second crop of wheat nearly ripe; it is from four to five feet high, and with full good heads. I have the second crop of potatoes ready to use, grown on the same land as the first potato crop, since the middle of last February. Mangel wurtzel beets, planted last June, weigh over 20 pounds each.

SWINGING STANCHEONS.

I HAVE just returned with a feeling of pride from my stable, where I have been watching my cattle, and observing their condition, and have come to the conclusion after a busy, practical, and observing life of over seventy years, that certainly we are progressing. For when I was a boy the south side of a straw stack was the best shelter that was afforded cattle, but after a while the more considerate, gave them the shelter then of a stable, and the question soon arose how to fasten them to the best advantage.

Some tied with ropes, others with chains, and a great many other devices were used, but the best thing I ever saw is one I am using now, W. C. GIFFORD'S swinging cattle stanchions, manufactured at Jamestown, N. Y. When I first placed them in my stable, two years ago, I had to close about one-half of them, but never since, as they always fasten themselves, and the rapidity with which a herd of cattle can be put up is astonishing, as all a man (or child) has to do is to keep them back. After they are fastened they have much freedom of action in moving either to the right or left, or forward, and this *last* movement is *indispensable* for the ease of the animal in getting up.

I can cheerfully recommend these stanchions to my brother farmers and stocksmen, as they are just what they are recommended to be, not a patent swindle but a *practical benefit*. And I verily believe, did the stockmen of our country know of their value, there would not be a well regulated stable without them.

Tomhannock, N. Y. THOMAS HOAG.

Arboricultural.

DECIDUOUS SHRUBS FOR HEDGES.

THERE are three natural and proper offices of the Hedge, viz.: the barrier, screen and ornament. In the last two only is to be classed the subject of our remarks, for with the most skillful pruning their growth is neither compact nor impervious enough to constitute a practical barrier.

Most dwellings, however, have fences, and, usually on three sides, unsightly ones of tight boards. Now, Nature abhors a stiff, straight wall, a dead blank. Hence the eye is not pleased unless said blank fences are screened with hedges of green, or green mingled with flowers. For such purposes the deciduous shrubs have decided advantages. They grow vigorously and produce rapid effects. They give grace and variety of outline, and, above all, yield a beautiful and continuous series of flowers. The value of these qualities is inestimable, especially where many evergreens are employed and a lighter and more cheerful aspect is required to complete the balance and contrasts of the picture. To fill out the catalogue of good qualities, we should mention a readily-transplantable nature, hardiness, and low first cost. Full enjoyment of more charming traits, however, depends very much on the system pursued in planting, pruning, and selecting varieties. By planting, we mean the method of disposing the members of the Hedge. Nature, our type of good workmanship, hardly ever uses the straight line. It is in accordance with good taste, therefore, to constitute the Hedge of a double row of shrubs, no one fronting its neighbor in the next row, but rather filling up gaps, and offering, in the more open spaces, fuller development of character. In furtherance of the same idea, these rows should be somewhat wavy in their course in relation to the fence, and varied, here and there, by single shrubs, prominent for beauty or size, that may stand as outposts to the main body.

The pruning employed is that of the *Weigela* type of shrubs, and consists simply in cutting out radically every winter the wood that has borne flowers during the previous season and clipping lightly, for symmetry, the remainder on which are formed the buds of coming bloom. All indiscriminate shearing is to be avoided as utterly destructive to these buds.

We subjoin below a list of the shrubs that should make up the body of a well-designed Hedge, and of these a large majority will be found under the *Diervilla* or *Weigela* type in relation to their pruning. This does not prevent, of course, the employment of any variety for outlying positions, provided no plants of too rampant or straggling natures be selected. Every member of a family is not always mentioned where it might be, and only the most prominent *varieties* are designated. Endeavor is also made to secure a continuous succession of flowers throughout the season. Affixed to each variety will be found the figure 1, indicating the larger ones next the fence, and figure 2, the smaller ones in front:

2. Berberis Purple; 1. Colutea, in variety; 1. Cornus sanguinea; 1. Cornus sericea; 2. Coronilla emerus; 2. Cydonia (Japan Quince), in variety; 1. Deutzia crenata; 1. Deutzia crenata fl. pl.; 2. Deutzia fortunii; 1. Eleagnus hortensis; 2. Hibiscus (Althea), in variety; 1. Upright Honeysuckle, red and white; 1. Philadelphus grandiflorus; 2. Philadelphus laxus; 1. Salix (Willow) capræa tricolor; 1. Salix (Willow) pentandra; 1. Salix (Willow) rosmarinifolia; 1. Spiræa Billardii; 2. Spiræa collosa alba; 2. Spiræa canadensis; 1. Spiræa nepalensis; 2. Spiræa prunifolia; 2. Spiræa Reevesii; 2. Spiræa Thunbergii; 2. Spiræa tomentosa; 2. Spiræa ulmifolia; 2. Weigela, (dwarf), with variegated leaves; 1. Weigela rosea.

SAMUEL PARSONS, JR.

TESTING FOREST TREE SEEDS.

FOREST tree seeds some years fail to mature, owing to various causes, which may or may not be known. Sometimes long-continued rain at the time the trees are in bloom will prevent the distribution of pollen, and although the envelope will continue to grow, the germ or kernel is defective. Then again, there are some species, like the Negundo or Ash-leaved Maple and Ailanthus, in which the two sexes are separated, one tree bearing the pistillate and another the staminate, and unless the two are in close proximity the seeds, which are always borne on the former, will contain no kernel. We have upon our grounds a large tree of the Negundo Maple which is loaded with seed-pods every year, but there being no staminate tree in the neighborhood, they are always false, although appearing to be as large and plump as the most perfect of their kind.

Climate also frequently has a singular effect upon some trees, in making them produce abortive seed. The trees may grow vigorously and be apparently healthy, the flowers perfect to all outward appearance, but the seeds never come to maturity. This is notably the case with the European Larch when grown in this country. We have also known the same thing to occur with foreign species of Ash, Elm, and other foreign kinds cultivated here.

It would be well for those who have failed to make certain kinds of forest tree seeds grow to bear the above facts in mind and take the precaution to test them before planting very extensively of any or all kinds. Many a dollar might be saved in this way, besides much time and vexation.

Insurance Department.

AN IMPORTANT DECISION.

SOON after the late war began the life insurance companies ceased to receive the premiums due from Southern policies, and as default was made marked them off as terminated. The holders of these policies were not content with this disposal of the matter and claimed that the policies should be restored upon payment of back premiums, and that the death-claims that had matured meanwhile should be paid. Though many of the companies compounded these claims, none of them conceded their legality and after a deal of tedious litigation the matter has been decided by the Supreme Court of the United States, which holds that: All contracts with the enemy were suspended during hostilities, but cannot necessarily be revived by a restoration of peace. In this case such restoration would be unjust, because the companies could not compel the restoration of all the policies by the payment of the back premiums with accumulated interest, and to grant this privilege would rehabilitate the worst risks only, since the better ones could take new insurances for one-fourth the expense—but that as the holders of these policies had over-paid the actual cost of their insurance and created by such over-payment a fund called the value or reserve, and since the default of payment was involuntary, they had a right to recover the equitable value of their policies at the time such default occurred—and that since the companies had not received the premiums or considerations for insurance, they could not be held liable for the payment of losses occurring after payment of premiums ceased. It should be a matter for congratulation that this final adjustment of conflicting claims has been brought about at last.

THE CONTINENTAL LIFE AND THE INSURANCE DEPARTMENT.

IT is said that the Superintendent of Insurance made an examination, either in person or by proxy, of the Continental Life Insurance Co. a few weeks before its condition was made public. If he had the power to prevent a catastrophe of which he had ample warning, his conduct is open to severe censure. If he had no such power, then it is high time to abolish an expensive, cumbrous, fallacious and demonstrably useless department and enact in its stead a code of laws that will reach just such cases as that of the Continental.

Floricultural.

SUGGESTIONS.

If Lily beds, or those of herbaceous perennials, are so low that they will hold water when the ground becomes frozen, they should be filled up above the surrounding level. For Lily beds nothing is better for this purpose than fresh-water muck and sand, or leaf-mold and sand, well mixed together. We are convinced from experience that a soil thus constituted is one of the best for most of our hardy Lilies, but especially for such as *auratum*, *Chalcedonicum*, *Washingtonianum*, *Humboldti*, and others that seem less vigorous in this climate than such as the *speciosums*, *longiflorums*, *umbellatums*, etc. For *Tritomas*, those showiest of fall Lilies, we again call attention to our simple but effectual method of carrying them through the winter out-of-doors, viz., forming a little hill of long horse manure about each plant, and covering this with coarse sand. The long leaves may be cut off near the ground or twisted together in a central column.

It is well to detach all Vines from their supports, the branches of which are liable to be winter-killed—and few are not—and either coil or collect them in as small a compass as may be and cover with boards, barrels, boxes, or, in the absence of those, hay, straw, or litter. Shelter from the sun and winds is the main object we need have in view. Many hardy plants need shelter only from the sun, and for this purpose boards or boxes may be preferred to a closer covering. We have known the Chinese Honeysuckle and the Ivy to be killed to the ground in a direct Southern exposure, while they were unharmed in a Northern one, protected in neither case. The rationale of protection, in fact, seems to us to be but imperfectly understood. We have for a long time believed that the Rose bushes and other shrubs which are incased every fall in cones of straw, tightly bound, might better be left entirely exposed. If so, a great deal of trouble and time might have been, and might be, saved.

In detaching *Wistarias*, *Clematis* and the like, it is difficult to avoid breaking main stems if the Vines have been permitted to intertwine among themselves or about the trellis or support. A little attention to training them as they grow during the summer will remedy this in a measure.

For collections of *Rhododendrons*, *Kalmias*, *Madonias* and other broad-leaved evergreens, shelter from strong winds and a thick matting of leaves upon the ground up about the stems to the lower branches are serviceable in protecting both roots and buds.

If new shrubs and trees have been determined upon for spring planting, it is well to conclude where they shall be planted and to dig the holes now. Reject the poor soil from the bottom and add such as may be obtained of a suitable nature, always bearing in mind that manure must not be used near the roots of newly-transplanted subjects.

As the earth will freeze whether it is covered or not, the object in covering is not to prevent its freezing so much as to keep it frozen and to avoid the effects of short and sudden changes in the temperature. It is not, therefore, advisable to use protecting material until after or during the first cold snap.

It is a good plan to procure a quantity of good soil and, scalding or baking it if preferred, place it in the cellar for winter use. It is also a good plan to express the juice of horse manure which has been soaked in water for a few days and collect it in old bottles. A tablespoonful of this added to a quart of water and used every week or so will furnish all the stimulant that plants require.

The long boxes used by nurserymen for packing trees, a foot or more square, or similar boxes, are excellent for wintering such plants as *Pelargoniums*, *Agaves*, *Agapanthus*, *Amaryllis Vallota purpurea*, *Erythrinas*, *Eucalypti*, *Hydrangeas*, etc. Raise the boxes from contact with the cellar floor, make a two-inch layer of sand, then place the plants and fill up with sand that is neither dry nor wet. Thus they may be left until spring if the cellar is of medium dryness.

We hope that our friends will give more time and thought to flowers during the long period from now till spring than ever before. Those who are unable to obtain books may easily obtain catalogues, many of which are little less than floricultural or arboricultural works of practical and trustworthy utility.

DOCTORING PLANTS.

The impatience of many ardent floriculturists in their first efforts, reminds one of little children who must needs pull up their plants every day or two to find out why they don't grow.

Floricultural books are collected in numbers and by a "cramming" process their contents are piled up in heaps with all the haste with which valuable articles are thrown together when rescued from the flames of a burning building. This miscellaneous pile of information is heaped upon the first plant that winks and if, in the course of a few minutes, it doesn't begin to bloom or its growth can't be measured with a tape-line, it is subjected to a regular and heroic course of treatment. A little liquid manure or "special fertilizer" in powders or perhaps a dose of tobacco, hellebore, whale-oil soap or carbolic acid, one or all, are administered. Perhaps the soil is soaked with lime-water and if in an hour or so no visible improvement be apparent, fresh soil and a shift to a larger pot are deemed necessary. Then the leaves are sponged and alcohol or *eau de cologne* is blown at them through atomizers and, in short, the poor plant is doctored to death.

Impatience in the too zealous beginner is one of the most prolific sources of failure. Floriculture is not such a purely mechanic art that one should deem himself master of it after having studied a few rules gleaned from this, that and the other catalogue and book. Such rules may be excellent—but a degree of practice is required to determine when and how far they are fitted to the case in hand. A theoretical knowledge alone of plant cultivation is good; a practical knowledge is better. But both should go hand in hand at the least until by their mutual assistance, a sound rudimentary knowledge is obtained that shall easily discriminate between the true and false, as in the future one's studies may be pushed far beyond his opportunities of practical tests.

We advise our zealous beginners resolutely to refrain from "doctoring" their plants if they would avoid discouraging failures. A little common sense will constitute them tolerable nurses, and it is the simple care thus implied—call it gift, tact, skill or what you may—that enables many who professedly know nothing about plants to obtain better results than others who parade their botanical information, and are ever pleased at the opportunity of glibly rattling off an ostensibly unlimited string of hard Latin names.

"Tell me" asks Mrs. Floribundibus of Mrs. Brown "how it is that your *Pelargoniums*, *Bouvardias*, *Camellias*, *Aspidistras*, *Cyclamens*, &c. thrive so charmingly? And you have but this octagon window—while I have a conservatory heated by steam, fumigated periodically and cared for according to the latest instructions of professional men. And get in comparison with yours, how wretchedly my plants look! Pray tell me your secret." Alack! Mrs. Brown is conscious of doing so little to her plants that she can make no answer that in any way enlightens her friend Floribundibus. The fact is—A good nurse is better than a bad doctor.

An Old Gardener.

MISCELLANEA.

Tritoma Uvaria.—We saw this plant a few days ago blooming under glass where the sun never touches it. The flowers, instead of being flame-colored above and yellow beneath, were all of a bright lemon.

EXCHANGE.

I will send Aster and Euphorbia seeds in exchange for almost any kind of seeds your readers may see fit to send me. Will take Dahlia roots in exchange next spring.—Brownie, *Catskill, N. Y., P. O. box* 258.

Pomological.

HALF SWEET AND HALF SOUR APPLES.

The "half sweet and half sour apple" is again heard from. This time it does not come in quite so "questionable a shape" as heretofore. I almost saw this "great wonder." It had only just been eaten when I called to see it. The following from the Syracuse Standard gives a full description "how the thing was done:"

Several years ago, Mr. George Wilkinson, of Lee, Oneida County, tried a novel experiment on one of his young apple trees. Taking the graft, he quartered it and abstracted two quarters, supplying the vacant places with grafts from another tree of a different species. For instance, taking a greening graft he cut away half of it, supplying the deficiency with grafts from a Tallman sweet, and awaited the result in the ripe fruit. Ordinarily, one or the other graft comes out ahead in the process of development: but, in this instance, the result has been the production of an apple showing the distinct qualities of both species and in distinct parts of the ripe fruit. We were shown, recently, by Mr. Perry, of the firm of Perry & Robinson, a couple of these apples. The exterior appearance was peculiar, in that two quarters presented a "rosy-cheeked" appearance, indicating the Tallman sweet graft, while the other two quarters were green, the result of the "greening" half of the graft. The interior appearance did not indicate the different characteristics in such a marked degree. But the taste of both kinds of apples was preserved. The experiment was a novel one and the result ditto.

In case the Rural doubts the above statement, I am promised that a sample of the apple described shall be sent you for examination, as the tree produced nine bushels.

I understand that the same man has produced a *seedless* apple, by setting a clon, top down. I suppose that the clon became so "bewildered" by being set in that uncommon manner that it did not know how to produce seeds. The greatest wonder is that the apple was not reversed and grow from the blossom end.

Syracuse, N. Y. Nelson Rutter.

[We never doubted the existence of the "sweet and sour" apple, for it has been as familiar to us as the Rhode Island Greening, from our boyhood up to the present time. Forty years ago there were old trees of this variety in the orchards of Western New York, where we first became personally acquainted with it; but the apples were seldom "half sweet and half sour," but kind o' hit and miss style, some streaks being of a sweet tart and others a little more acid. (See Downing's Fruits of America, Warder on Apples, Thomas' American Fruit Culturists, or any other standard pomological work.) The man who claims to have produced this variety of apple, in the manner described above, is simply asserting what he will find it difficult to prove. Besides, it was well known before the oldest present inhabitant of this mundane sphere was born. —Ed. Rural.]

THE PINNEO PEAR AGAIN.

This is one of the American pears which has a history of more than ordinary interest, consequently, it is well to repeat it occasionally in order to keep our young orchardists informed as to what has been done in the way of "coining" new sorts out of old ones. We well remember the time when small trees of the Boston, *alias* Pinneo, sold quite readily at from two to five dollars each and everybody who purchased one thought he was getting something new. But we will let a correspondent of the American Agriculturist tell the story of this now famous pear in his own way:

As one of the duties of the Centennial year, we recently paid a visit to the Pinneo pear tree, it being among the oldest inhabitants of the Nutmeg State. It still lives in a green old age, upon the farm of Edward M. Clark, in the town of Columbia, and is reputed to be about 140 years old. The stem of the tree is two feet or more in diameter, and still bears fruit. It is quite widely distributed through Columbia and the adjacent towns and has had a good local reputation for a century or more. Notwithstanding the introduction of new varieties through the influence of our horticultural societies and publications, it still maintains its place as a first rate summer fruit. The history of this excellent pear shows the great progress we have made in horticultural matters. It lay buried in Connecticut for a whole century, before it was made known to the public. It was grown in such abundance, that the farmers sent their surplus fruit to Hartford, and from that city it was sent to Boston, where the people know what fine fruit is. C. M. Hovey got hold of it in 1843, exhibited it, grafted it, and introduced it to nurserymen and fruit-growers as the "Boston" pear.

Fifty years before, Edmund Yeomans, a discriminating nurseryman of Columbia, and familiarly known as Uncle Ned Yeomans, had propagated and sold the same variety named after the elder Deacon Pinneo, who found the seedling in the woods and transplanted it to his garden. It is unquestionably a seedling, for the suckers from the roots, when transplanted, as many of them have been, bear the same fruit as the tree. At the present day, with our horticultural and agricultural journals, our fruit exhibitions, in almost every county in the older States, and the American Pomological Society, to gather up results, and winnow the chaff from the wheat, such a history as this would be quite impossible. The world does move.

PROTECTION AGAINST RABBITS.

As the winter approaches, the orchardist, in regions where rabbits abound, will, if he is a careful man, take some precautionary measures to protect his trees from these pests.

There are many things which may be applied to the stems of the trees which will prevent their attacks, among which we will name a few:

Sulphur, soot and lime, made into a thin paste and spread over the bark, is an excellent preventive, as the rabbits have no liking for such a mixture. Cow manure and lime will answer the same purpose, but must be applied pretty thick and well spread on the bark. When tar can be had, it may be spread upon common brown paper, the latter wrapped around the stem—the tar side out. Coarse strips of bark from some forest trees form an excellent guard, if placed around the stem and held in place with strong cord or wire.

Some such precautionary measures should be practiced in regions where mice and rabbits are plentiful, and if it were done, we would hear less of girdled apple trees, which, by the way, is a very common complaint every spring. A word to the wise should be sufficient on this subject.

Entomological.

CONFERENCE OF GOVERNORS ON THE GRASSHOPPER SCOURGE.

The conference recently held at Omaha to consider the grasshopper problem, was attended by Gov. J. S. Pillsbury, and his private Secretary Pennock Pusey, and Prof. A. Whitman, of Minnesota; Gov. Kirkwood, of Iowa; Gov. John L. Pennington, of Dakota; Gov. C. A. Harden, and Prof. C. V. Riley, of Missouri; Prof. G. Thomas, of Illinois, who represented Gov. John L. Beveridge; Gov. Osborn, of Kansas; Gov. Silas A. Garber, ex-Gov. R. W. Furnas, Profs. Wilber and Williams, of Nebraska.

From the reports of the proceedings appearing in the Western Rural, we give a few abstracts. The opening address was made by Gov. Pillsbury of Minnesota, who recommended that the Governors of the States represented should join in appealing to the General Government for aid in making war against this great scourge of the west.

Prof. Thomas of Illinois followed in stating it as his belief that the aid of Government should be obtained to secure a thorough investigation into the history of the insect in order to know how best to combat it successfully; He said that the locust is a national insect and a national plague.

Gov. Pennington thought that the cultivation of crops that mature early was advisable. The locusts come from as far north as the British possessions. The evil was widespread, and so serious as to warrant an appeal to Congress. Even if no relief be obtained, much knowledge would result from a scientific commission.

Gov. Hardin thought that it was the duty of Congress to take some part in an effort to mitigate so great an evil; It is a common evil extending over large portions of a number of States. The Department of Agriculture should gather information in regard to it. He thought that he should make some suggestions in Missouri, and perhaps appoint commissioners to destroy the insects. It was a great evil, and it was almost a military duty to destroy them.

Prof. C. V. Riley (who has done more than all others in the investigation of this locust plague), said that the home of the locusts was in Dakota, in the far Northwest and in the mountain regions. He thought Congress should urge organization, and furnish means to combine and destroy the young insects in the Spring. Through the Governors of the States a bounty might be offered per bushel for eggs; this would be money well spent. Organized effort should certainly be made, and the Governors might appoint men of knowledge this Winter to locate their breeding places and take means to destroy them in the Spring. With a microscopic examination almost any one could determine their condition. If the Winter was severe their eggs probably would become addled and not much trouble would ensue. Ditching was the most valuable means, and it should be carried out on a systematic scale. People should be organized in every district in the West, and while he was not afraid of future evils, yet it was necessary to act in concert. The unfledged insect could not travel more than four or five miles during its brief period of five or six weeks. He urged the steps suggested above to be taken this Winter, also to examine the ground in their native heath. The nation owes it to the West to secure this information. Congress does not comprehend the magnitude of this question. The devastations of this plague are the most important and extensive in the country. He insisted first of all that the settlers should not leave the West by any means. The insect will cease to trouble; it is not an annual plague.

Gov. Pillsbury's recommendations were read to the conference by Pennock Pusey, his Secretary. They are—1st, Crushing by rollers, etc., and catching them by bags and traps during mating, when by reason of their inactive condition they may be destroyed. They are in this condition from the middle of August until cold weather. 2d, Plowing under deeply of eggs and thorough harrowing of bare, dry knolls and other small, warm spots where they are deposited, which destroys their germinating power. New breaking being a favorite resort for egg deposits, this is available in the ordinary course of farm work, which should be delayed to as late in the Fall as practicable. 3d, Preserving prairie grass till Spring, by means of fire guards along township boundaries by plowed strips or wide parallel furrows, and the careful burning of the intervening spaces. The burning of the grass with the young grasshoppers in the Spring, is a very effectual means of wholesale destruction. 4th

Placing loose straw on, or near, the hatching places, into which the young gather from the cold in early Spring, where they may be destroyed by firing the straw. To this end straw should be carefully saved. 5th, The construction of deep, narrow ditches with deeper pits at intervals, as a defense against the approaching young insects. In these they accumulate in great numbers and perish. 6th, Sowing of grain in "lands" or strips 50 to 100 feet wide, leaving narrow, vacant spaces through which to run deep furrows, and construct ditches into which the young are driven and destroyed. 7th, Catching the insects, especially when young and inactive, by such means as experience suggests. 8th, Finally, the driving of the winged enemy from the ripening grain by passing over it stretched ropes, aided by smoke from straw and other smudges, and by discordant noises, shrieking and yelling inducing their flight.

The whole subject was discussed at length, and a committee appointed to collect and issue in pamphlet form information in regard to all practical methods based upon observation and experience, for destroying these locusts or grasshoppers.

The following is the substance of the resolutions adopted at this conference:

1. That it will be wise and politic for the Legislatures of the States and Territories most deeply interested to enact a law offering a bounty per bushel for the collection and destruction of eggs and unfledged insects.

2. That the several Legislatures authorize local taxation for the proposed systemized efforts in the way of ditching, burning, &c., also to suggest the repeal of the game laws, or a modification of them, so as to prevent the destruction of the birds which feed on insects.

3. The prairie fires should be prevented until a suitable time for the destruction of the young grasshoppers by firing the grass.

4. That tree culture be recommended for harboring birds.

5. That as far as possible a survey be made of each state during the coming Winter to ascertain those portions in each county in which eggs are most thickly laid.

6. That it is deemed to be the duty of the national government to make some effort to destroy or counteract the great pest, and thus prevent its injuries, and the attachment of a special commissioner to one of the Government surveys sent annually to the West is recommended, and that $25,000 be appropriated for the purpose of paying the expenses of the Commission.

Domestic Economy.

ORIGINAL RECIPES.

Recipe for Graham Bread Wanted.—Will some of the lady readers of the RURAL, please give, through its columns, a recipe for making Graham bread, and greatly oblige NINA.

In the RURAL of Aug. 5th, I gave a recipe for Graham bread, which I will repeat for NINA'S benefit. Just before retiring at night, dissolve a yeast cake in a teacup of tepid water; add fine flour, to make a batter; cover, and set in a warm place. The first thing in the morning, add a pint of tepid water; one teaspoonful of salt; a half teaspoonful of soda; two tablespoonfuls of sugar; one tea cup of fine flour, and Graham flour enough to make a stiff batter; put the mixture in a bread-pan; set it in a warm place until sufficiently light. Bake in a moderate oven. If any of the lady readers of the RURAL have a better recipe, will they please send it along?—MRS. RUSTIC.

Query About Screens.—Will some reader of the RURAL NEW-YORKER inform me how to make a pretty screen that will not be very expensive, or require too much time in making, but will intercept the light and heat of the stove and at the same time be an ornament to the room?—A READER.

[Will some of our fair correspondents give the desired information and oblige ED. RURAL.]

An Excellent Recipe for Curing Hams.—The following quantities are for twelve hams. Take three pounds of fine salt, one-half pound of saltpeter, pounded fine, and one pint of molasses. Mix the above well together, and rub each ham with the mixture. Then put them in a cask and allow them to stand five or six days, after which they should be reversed, the top hams being put in the bottom, sprinkling fine salt between each layer; again let them stand five days, when a pickle should be prepared and put on them, composed of salt and water, strong enough to bear an egg.

Always pack hams with skin side down, and so continue till cask is full or pork gives out. After remaining in the pickle six weeks, the hams should be taken out, strings put through them and hung up to drain for four or five days, when they should be marked and branded and sent to the smoke house. For keeping them during the summer months, when they are liable to be infested with worms, etc., wrap them well in brown paper and pack in a case or barrel, with a liberal supply of good dry wood ashes between and around them. In taking one out for use, be particular to cover the rest with the ashes. I have used this recipe for years and have always had fine meat.—E. J. K.

Test of Brine.—A common test of the quantity of salt necessary to add to water in making brine for pickling meat, is to continue to add salt till an egg will swim in it. This, however, is an imperfect test of the strength of the brine, since an egg will float in a saturated solution of salt and water, and will also float, if to the same saturated solution a bulk of pure water equal to twice its own bulk be added. According to Gay-Lussac, seven ounces and a half of salt are necessary to saturate an imperial pint of water. This is important, since the efficacy of brine in preserving meat depends very much upon getting a solution of salt at the exact point of saturation.—E. J. K.

SELECTED RECIPES.

Squash Pie.—Having pared the squash and removed the seeds, stew it in as little water as possible till soft, then squeeze through a colander. Stir into the squash enough sweet milk to make it as thick as batter; spice with ginger, cinnamon and nutmeg; sweeten with sugar, and add two well-beaten eggs for each quart of milk used. Fill pie-plates, lined with crust, and bake for about an hour in a moderate oven.

Mince Meat.—Four pounds of the round of beef, after it is boiled and chopped; eight pounds of chopped apples; two pounds of chopped suet; three pounds of raisins; two pounds of sugar; one tablespoonful each of clove, cinnamon, allspice, and two large nutmegs, one pint of molasses, one quart of cider, one and a half pints of good brandy. Salt to taste.

Another.—A shin of beef boiled down till very tender, one pound of nice clear beef suet, chopped very fine, a tablespoonful of salt, six pounds of greening apples peeled, cored and chopped, three pounds of raisins stoned, three of currants carefully cleaned, one pound of brown sugar, a cup of maple sirup, half a pound of citron, shreded, half a pound of candied lemon peel, a quart of the best cider. Instead of the cider, some persons prefer a quart of Madeira wine, and a little brandy.

Rye Bread.—We set in the evening, with good hop yeast, and mold it in the morning just the same as wheat bread, only a little stiffer. Let it rise and mold it down again. This makes it spongy. After this it will come up very quick. Shape it into loaves, and when light enough, bake it in a moderate oven, a little longer than ordinary wheat bread.

Leg of Mutton Stuffed.—Wash and wipe the mutton, grate a pint of bread crumbs, season with salt and pepper, a teaspoonful of sweet marjoram, two teaspoonfuls of sage, and half a one of sweet basil (all dried and rubbed fine), chop a medium-sized onion, and put it over the fire in a small saucepan, with butter the size of a large egg, stew for five minutes, pour over the bread crumbs and stir in thoroughly; with a sharp knife make a deep incision on the long side of the leg parallel with the bone, push the dressing in, making it go all through the length of the leg, skewer it at the opening where you stuffed it, season the leg with pepper and salt, dust it with flour, and roast two hours in a hot oven, keeping a little water in the pan to baste it with, which should be done every fifteen or twenty minutes; thicken the gravy with browned flour, put a few spoonfuls over the meat when you place it on the dish, and serve the remainder in a gravy-boat. To be eaten with currant jelly.

Boston Brown Bread.—Take two pints of sifted corn-meal. If this is old or dry, pour on a sufficiency of boiling water to wet it thoroughly. If the meal be fresh and moist, the water need only be warm. In the first case mix in gradually, when the mass is cooled, one pint of rye-meal; in the latter the two may be mingled and the water poured on both at once. Now add one even teaspoonful of salt, and one large tablespoonful of molasses; at the same time mix in thoroughly half a teacupful of fresh, sweet yeast. Let it stand over night in a moderately warm place. It should be light in the morning, but still sweet. Nevertheless, I would add a small teaspoonful of soda to neutralize any latent acidity. After this is perfectly incorporated, the mass should be placed in well-buttered earthen baking-pans, or, still better, iron ones, and smoothly rounded off. The pan should be only three-fourths full. It should be set in a warm place, and when the loaf has risen so that the pan is quite full, it is ready for baking, the oven being previously well heated.

Chicken Cheese.—Boil two chickens till tender. Take out all the bones, and chop the meat fine, season with salt, pepper and butter. Boil down the liquor the chickens were boiled in, until there remains only enough to make the chopped meat quite moist. Put the meat into a mold of any shape that is desirable or convenient. When cold turn out and cut in slices. It is excellent for picnics or for a lunch when traveling.

Cream Muffins.—An excellent and well-tried recipe. One quart sweet milk—half cream if you can get it—one heaping quart of Graham flour, six eggs, and salt to taste. Bake immediately in hot muffin rings. Your oven should be hot, and the muffins sent to the table as soon as they are taken up.

Oatmeal Griddle Cakes.—One pint of oatmeal mush, one pint of flour, two eggs, piece of butter size of an egg, one and a-half pints of sour milk or buttermilk, one teaspoonful of soda. Beat well and add the soda dissolved in a little boiling water just before frying.

Hygienic Information.

CONCERNING SIMPLES.—No. 2.

PLANTS, after all, seem to have had impressed upon them a certain character, that serves as a passport. As a rule *white* indicates plants that are slightly aromatic, and are useful as emollients, while highly colored fruits have more fragrance and strength. *Yellow* on the other hand warns us of bitter and acrid qualities; *green*, astringent. Bluish, brown, and red seem to proclaim venomous varieties; they usually have a sinister aspect, too, when they are harmful. What is true of color is applicable to odor also. It may have been observed that a suave odor accompanies emollient and soothing virtues; that an aromatic perfume discloses stimulating principles; that alliaceous exhalations are the index to anti-scorbutic qualities.

Plants that are venomous give off a strong, fetid, penetrating odor. It seems as if Nature had designed that those flowers and leaves whose grace and beauty attract us, as well as those fruits that seem to invite the hand, should not become traps or nets spread out for our ignorance, or avidity, although at times necessary for our needs; hence they are made to warn us by their odors. Pernicious plants not infrequently grow in places not easily accessible to man, doubtless for good reasons. It becomes plain then why insipid plants have little or no color; why acrid and astringent virtues are indicated by yellow and green; why red points to the presence of vegetable acids, and why brown and black warn us of venomous qualities.

Many are familiar with the marsh-mallow (*Althæa officinalis*). City people are made acquainted with its merits through the medium of a delicious confection. It grows luxuriously in humid spots, bordering streams, etc. Its smooth stem offers no resistance to the hand, and no thorn lurks near leaf or flower to inflict punishment on the trespasser. The flowers are white or rose-tinted. Five petals form the corolla, the stamens are united. From the middle of purple anthers appear stigmas that surmount a short pistil. The fruit resembles a small melon divided into a great many slices. The root is thick and fleshy.

The mallow is a fine emollient as before mentioned. When boiled it gives off a mucilaginous liquor that is very serviceable. The infusion is excellent for coughs and colds. Is expectoration difficult? then a decoction of the roots. Are our digestive channels inflamed?—marsh-mallow; marsh-mallow for *baths*, in cases of inflammations and convulsive affections, marsh-mallow root is also an excellent substitute for the ring used by children when teething. Finally, if you have no use for it as a medicament, plant it in your gardens, it is a pretty plant. In any event it is the invalid's flower.

The mallows are a numerous family, and a beneficent. The boiled leaves constitute an excellent cataplasm, and an infusion of its flowers is soothing and a good pectoral. The mucilage in which they abound is also excellent for gastric complaints. This plant was not unknown to the ancients. The Egyptians and Greeks used it, while the Romans were loud in its praise. It has only one objection: it is plentiful and cheap, its preparation costing about one-sixth what is asked for patented mixtures that do their work no better, and are less palatable.

C. H. E. R.

WOOL NEXT THE SKIN.

IN your issue of the 4th inst., you quote from Dr. HALL of the Journal of Health in favor of wearing woolen clothing next the skin. The Dr. but spoke the opinion of perhaps the majority of medical and hygienic men, but in this case as in most others, there is a minority report, entitled at least to respect, if nothing more.

Let us consider the manner in which clothing becomes a protection against cold, for it of itself imparts no warmth, it merely prevents or hinders the escape of the air surrounding the body, and which has been heated by it. In this respect wool has the advantage of cotton, it being a poorer conductor of heat, therefore as an outer garment exposed directly to the winds and storms it, and the fur of animals have no superior. But the case is different when worn as an undergarment. Cotton in this case may feel cooler on the first touch, but from its readiness to receive heat it is soon raised to the temperature of the body, while the outer woolen garment hinders the heat from escaping. Place cotton and woolen cloth before a hot fire, and when the former is heated so as to be painful to the touch, the wool will barely feel warm. Now this sensible heat in contact with our bodies is what we are after, and it alone is what protects us. There is as much latent heat in linen, or even iron, as in cotton or wool, but the two former alone would afford little or no protection.

The Dr's. advice is good for sailors and furnace men who work mainly "in their shirt sleeves," but I cannot either in theory or practice consider it good for those who constantly wear a woolen garment outside. I have long been of the opinion, amounting in my own mind, to a certainty, that the constant friction of wool by enfeebling the skin induces rheumatism and liability to colds or chronic catarrh. The excessive friction of wool must of course be a greater drain upon the vital forces than the slighter friction of cotton. I believe wool to be an excellent remedy as a counter-irritant in some diseases, but I see no good reason on that account for its habitual use especially in health, any more than in the habitual use of quinine, because it is a good remedy in intermittent fever. Isolated cases of course prove no theory, but still they are good evidence as far as they go.

A friend now (if alive) a physician of some 75 gave me this account of himself about twenty years ago. He was born and reared to manhood in Vermont, and was considered by his parents of too delicate a constitution for the occupation of farmer, so his mother kept him encased in home-spun flannel and sent him to a medical school. After acquiring his profession, he began to suspect that this irritating woolen flannel was not good for him, but resolving to do nothing rashly, he experimented by cutting off the left sleeve of his wrapper. He soon found that his left arm had a greater circumference than his right (he was not left-handed); that it had a more healthful and ruddy appearance, its flesh was more firm and vigorous. He took the hint from this and gradually dispensed with all woolen undergarments, and found his general health and constitution greatly improved.

Another intimate friend, leading mainly an indoor life, was afflicted with obstinate laryngitis and lumbago, took cold on the least exposure, was *obliged* to wear even in the hottest weather the thickest home-spun woolen flannel drawers and woolen pants, and always overshoes in winter even in his office, but could not wear woolen undershirts on account of the excessive irritation of the skin. Suspecting something wrong in his clothing he made several unsuccessful experiments to substitute cotton drawers, the lumbago always returning with a vengeance. Resolving at last on the change at any cost he made it on a clear cold day in January, and has never worn woolen undergarments since; the lumbago gradually disappeared and the laryngitis slowly followed suit, and though more than thirty years have intervened since the change, he has in the interim enjoyed better health than the majority of mankind. Now these two men did not know each other at the times of these changes, but both acted simply from their own judgment.

S. B. PECK.

Muskegon, Mich.

FOOD FOR LEAN WOMEN.

THE Druggists' Circular tells how lean women may grow fleshy, as follows:—A pint of milk taken before retiring at night will cover the scrawniest bones. There are many lean and lank females who sigh for the fashionable measure of plumpness, and who would be vastly improved in health could their figures be rounded with good solid, flesh. Nothing is more coveted by thin women than a full figure, and nothing provokes the scandal of one of the "clipper builds" as the consciousness of plumpness in a rival. In cases of fever and summer complaints, milk is now given with excellent results. The idea that milk is feverish has exploded. It is a great mistake to scrimp the milk pitcher.

Cure for Corns.—A certain cure for corns or sore toes of any kind is: Wrap the toe in soft cotton batting, draw on the stocking and shoe, and you will have no more trouble from that source. The writer cured a very painful corn between the toes in this way in less than a week. —BROWNIE, *Catskill, N. Y.*

POULTRY ON THE FARM.

Much room as there may be for doubt in regard to the profits derived from poultry raising when conducted on an extended scale, we think few will question the profitableness of a few fowls when kept on the farm. Their food, in great part, is made up of gleanings of the fields, noxious insects and waste materials from the kitchen. It is true, that when too large a number of fowls are kept on the farm, they may draw too heavily upon the grain in the field or vegetables in the garden; but, the thousands of noxious insects scratched up and picked off from the plants must be placed to their credit, which, in many instances, would more than balance what could rightfully be charged to the damage account. But a farm without fowls would leave the farmer's table barren of fresh eggs, broiled chickens, and many other articles which are almost an indispensable adjunct to farm life and good living everywhere; consequently, we look upon the birds bringing such luxuries as worthy of the highest consideration in our domestic economy. In addition to the usefulness of domestic fowls, they should also rank high among the ornamental surroundings of a country home; for we can imagine nothing more beautiful than a flock of some of the pure breeds roaming over lawn or field, or floating upon the surface of some sheet of water during the day, then flying or trudging home at nightfall for their supper. It may be that there are men to whom this ornamental view of the subject will appear more sentimental than practical, but it is just as legitimate and important as the admiration of beautiful fruit, flowers or pictures, and the one who can take such a view of the raising of fine poultry, has the advantage of the one who cannot, for he adds to his pleasures thereby.

We notice that there is a tendency of late to breed for beauty among our poultry fanciers, and it should be rather encouraged than otherwise, for it is a notable fact that the mind must be attracted through the eye before it will commence to investigate. Believing that poultry keeping in all its branches is an important industry, it has received special attention in the columns of the Rural New-Yorker for several years, and we propose not only to continue it in the future, but to engage the best talent obtainable in conducting this department. We have at the present time among our regular contributors, several of the most scientific and successful breeders of choice poultry known in this country; and the readers of the Rural may rest assured that whatever may transpire of interest to them in regard to this constantly-increasing industry will appear in its columns; for it is our aim to make this paper an authority on all subjects relating to rural life.

WORKING AGAINST THE FARMER.

It has become quite the fashion of late among a certain class of periodicals which depend largely upon a country circulation for support, to tell the farmer that men engaged in other professions or industries are his most implacable enemies. This, of course, is in unison with the oft-repeated saying, that "the farmer pays for all," which, by the way, is as far from the truth as the former assertion in regard to his enemies among men in other lines of business. Now there is no better ground for assuming that the capitalist is an enemy of the agriculturist, than that every farmer is the enemy of his doctor or minister.

Every man, no matter what his calling, aims to better his condition financially, and in doing this he is very prone to take advantage of the necessities of others in his dealings; and until we learn that it is the general practice of farmers to sell hay for five dollars per ton, when the market price is ten, we shall believe they are like other men and take all they can get for whatever they have for sale. "But," says the farmer who resides hundreds of miles from our seaboard cities, "do not the railroads combine and charge exhorbitant rates for carrying our produce to market?" True to the letter; but what was, or what would, your farm produce be worth without the railroads? Then, would it not be well to ascertain just how much the capitalists, who furnished the money to construct and equip these very roads which you now denounce in no unmeasured terms, made on their investments? Just look up some of the original investors in your nearest road and let them answer; for if railroad building is half as safe or paying a business as farming, then our eyes have been grossly deceiving us all through life.

The capitalists who put a road through a region of country, expect to make money on their investment; a right which every reasonable man will concede is their just due, and the changing of rates to secure this or even more, cannot be construed into enmity to the farmer or others who may desire to use the facilities offered for transportation of various articles over the line. There is no compulsion in this matter of transportation, and if the farmer in Allegany Co., N. Y., or elsewhere, does not care to pay the exorbitant rates charged for taking his produce to market, the country roads are open to him and he can haul it with his own team, just as he or his father did thirty years ago.

We have lived long enough to experience some of the changes made in these matters during the last quarter of a century or more, and although there is doubtless some extortion on the part of transportation companies, we would not like to go back to the days of twelve cents a pound for butter, (and take it in trade at that,) six cents a dozen for eggs, and other farm products at similar prices—all because there was no cheap and ready means for transporting them to a distant and better market.

The so-called enemies of the farmer have helped very materially to make these beneficial changes and, for our part, we do not think it becomes us to treat or speak of them as outlaws, deserving nothing better than universal condemnation. Suppose we dam up the Mississippi, close the canals and house the locomotives for a few months or a year, and see how we can get along without these outlets, and what is known among farmers as the "giant monopolies!"

RURAL NOTES.

At Last.—After waiting patiently, we notice that some of our contemporaries have at last actually discovered that there was such a thing in existence as the "Centennial Dairy Ring." The Elmira Husbandman publishes a letter showing the incapacity, or worse qualifications of the Judges, while an Ohio paper which has kept an editor at the Centennial the whole season, announces with a flourish of trumpets that it intends to *expose the Dairy Ring*. Well, gentlemen! Propel! None can be more pleased than we are to see you lock the barn doors, *even though the horse has been stolen*. If you need materials for your terrible exposures, run over your old exchanges and examine the columns of the Rural for several months back. But are you not a "leetle" behind, this time? Never mind. "While the lamp holds out to burn," &c.

Corn and the Phylloxera.—Another Frenchman has discovered a "sure" method of heading off the much-dreaded *Phylloxera*, or Grape louse. This time, however, it is not by killing the pest but by diverting its attention and pampering its appetite for a sweeter morsel than grape roots. One M. Gachez informs the Academy of Sciences that for the last two years he has protected his vines by planting red Indian corn among them, the *Phylloxera* preferring the latter plant to the former, crowding upon it, leaving the vines unmolested. This is proceeding upon the same plan adopted by some of our vineyardists in protecting their vines from the Rose beetle by planting Spiræas and other plants blooming at the same time among them, which these pests prefer to the flowers of the grape.

Americans not Inventors.—A writer in the Engineer (Eng.) declares that Americans are not inventors, but mere imitators of others, especially of the English artizans. He claims everything in the way of inventions for Englishmen, asserting that "not one of the great inventions of the age has originated in the United States." The steam-engine, telegraphy, and like wonders, are all the outcroppings of English genius, leaving Americans with nothing to brag about above a Connecticut wooden nutmeg or an Ohio basswood ham. Poor fellow! we hope he may live to come to our bicentennary show, and write up the history of this puny nation.

We are Pained to learn by the following letter, of the death of one of our old-time agent-friends:

NUNDA, Livingston Co., N. Y.

Mr. Editor:—Thomas C. Bennett, who has been agent for the Rural New-Yorker for the last ten years in this place, died Oct. 18, aged 61 years. He has taken the Rural since its first publication, being twenty-seven years next January. We have felt that it was like a friend, surely coming every week and as gladly greeted by us all. Mr. Bennett was always interested in reading it; he, being a farmer, could always find something worthy of note and practice from its pages and *I* have found much excellent and profitable reading from the lady contributors of the Rural and would earnestly commend it to all pursuing a like employment. Respectfully yours, Mrs. T. C. Bennett.

What a Pity!—We are informed that Durand's "Great American Strawberry" is not only going to supersede all other sorts now known, but it grows so large that the good housewife will never think of asking her guests to take a dish of strawberries, but the question must needs be changed to, "Will you take *a piece* of strawberry?" Strawberries of this sort will have to be cut up like watermelons, and the slices passed around. It is a pity that Seth Boyden could not have lived to see the results obtained by his now illustrious neighbor, Durand.

Profits of Trout Culture.—Recent experiments show that it takes about thirteen pounds of kidney, liver and similar kinds of meat, to produce one pound of fish. This point having been determined, the owner of trout-ponds or streams can very readily ascertain whether the raising of trout for market by feeding artificially can be made a profitable business—not forgetting, however, that trout fed upon livers and kidneys are more beautiful to look upon than savory when cooked.

Ayer & Son, in their "Manual for Advertisers," in speaking of agricultural papers say, "No class of papers, with the exception of religious journals, are so carefully read or so long preserved for reference. Their circulation is principally among the most intelligent class of country population—*hence, they are of peculiar value to advertisers.*" Of the truth of this we are constantly reminded by receiving replies to advertisements inserted in the Rural but discontinued years ago.

Selling Pork Early.—Our Western contemporaries advise farmers to sell off their hogs so soon as they are ready for the butchers, instead of holding on for higher prices, during which time they may lose more or less by disease. Hogs, when exposed to rain and cold storms, do not gain rapidly in flesh, although they consume as much food as during warmer weather when laying on fat rapidly—and this is another reason for selling early and before cold weather.

RURAL BREVITIES.

A compound for preventing parasitic diseases in plants is offered in England under the name of "Salus."

Emory Cobb's Short-Horn bull, "Nineteenth Duke of Airdrie," valued at $20,000, died at Kankakee, Ill., Nov. 21.

It is reported that the beets raised for converting into sugar in Illinois this season, are so poor in saccharine properties as not to pay for working up.

The grasshoppers in parts of the Western States not fully annihilating the vegetation, the mice are reported to have come in great numbers to finish what was left.

Mr. Mechi, the noted English Agriculturist, has been elected to the Presidency of the London Farmers' Club. The honor of bestowing and receiving are about equal in this instance.

The consumers of Tobacco may consider themselves profitable citizens, as they have paid the Government nearly forty million in taxes on the weed during the fiscal year ending June 30, 1876.

About the only farm product which commands a high price in our market this season, is potatoes, now selling at $3 to $3.50 a barrel, with indications of a further advance. The Early Rose takes the lead in price.

The members of the Michigan Pomological Society are discussing the subject of a change of name, by substituting the word "Horticultural" in place of "Pomological" which, we think, would be a very sensible thing to do.

Correspondents of the Press who wrote continuously during the Centennial of what they saw, are now telling us of the "Recollections," in order to prove that their memory of recent events is still good and in working condition.

A Southern paper tells us that a sleek mule is a sure sign of prosperity in a community, and kind-hearted owners. We think this same sign may also be applied to other animals, for poor farmers generally have poor stock of all kinds.

There is said to be a cotton tree in Florida twenty feet high, with a stem twenty-six inches in circumference. To gather the cotton from such trees men climb up among the branches or use very high step ladders. Where is California now?

One of the patriarchs of English gardening, Mr. E. G. Henderson, founder and proprietor of the Wellington Nurseries, died on the 4th of November last, at the ripe old age of 94. Who can say, after this, that the occupation of a gardener is an unhealthy one?

The Poultrymen are anxious to know what has become of their awards at the Centennial Poultry Show. It is seriously proposed to club together, when the medals arrive, and have them cast into a Bronze Donkey for presentation to the Centennial Commission.

The apple crop throughout the Northern States, this year, is an enormous one, and some of our orchardists talk seriously of cutting down the trees. A friend writes us from Wisconsin that the "whole West is full of apples this fall, and such a crop was never known before."

A Western contemporary echoes our sentiments in proclaiming that the only "serene man" during these tempestuous political times is the "Agricultural editor" who quietly studies the Potato beetle or Ichneumon fly and watches the steady increase of his subscription list.

Mr. Cramer, the Lecturer of the Kansas State Grange, has prepared a Pocket Companion for patrons of Husbandry, comprising the rules, laws and regulations by which Granges are governed. It is advertised on another page and should be in the hands of every Patron who is interested in the Order.

The Farmer's Journal of Raleigh, N. C., after having passed through various metamorphoses and innumerable proprietorship, has finally fallen into good hands. It will in future, be conducted by Mr. R. T. Fulghum, whose experience as an Agricultural editor assures a valuable and readable paper. Long may she wave!

TH' OWD WOODEN PLOW.

Up by th' Blake mere'o'Morridge, not a long time ago,
There lived an old chap wi' an old wig o' tow,
His name wor Tom Morris, and I'll tell ye how
He made a discourse on an old wooden plow.
Gee ho Dobbin, gee ho Dobbin,
Gee ho Dobbin, gee up and gee wo.

Twor the tenth of October, and the oats wor just ripe,
On the settle he sot, and he smoked his long pipe;
And he thought a long time about this thing and that,
And said, "Tommy, sit down, and I'll tell you what's what."
Gee ho Dobbin, &c.

"These are terrible times, lad: I prithee draw nigh,
And I'll give thee a wrinkle or two ere I die;
I can't stand it much longer, it shortens my breath,
These new-fangled notions will soon be my death.
Gee ho Dobbin, &c.

"They're going too fast, lad, I tell thee, a deal:
There's Lord Talbot, o' Ingestre, and Ralph Sneyd, o' Keele,
And Sandon, and Buller, and Mainwaring, and Bill—
Lord! the stuff they've been talking—it makes me quite ill.
Gee ho Dobbin, &c.

"Wi' their bones and their acids, their drills and guhanner,
Thy grandfather, Tom, never farmed i' that manner;
He'd ha' stared hard enough if he'd heard what they say
About boiling o' oil cakes and chopping o' hay.
Gee ho Dobbin, &c.

"Then soughings a thing as, in course, they must alter,
So they go a mon's depth for to get at th' top water,
And they scoop out the dirt wi' a thing like a spoon,
And for lules—they'd be using o' bacey-pipes soon.
Gee ho Dobbin, &c.

"Then they prate o' their carrots, and mangels, and sich—
(As if growin' o' carrots would mak' a mon rich)—
Of hoeing o' turmits and cleaning o' yallows—
Stuff and nonsense!—and growing of wheat without fallows.
Gee ho Dobbin, &c.

"Why, it makes me to laugh; without fallows, indeed!
I think they mun ha' a soft place in their yed.
And what can ye think they've been doing just now?
Why, they've got up a laugh at an old wooden plow!
Gee ho Dobbin, &c.

"Ay an old wooden plow; and they say, to be sure,
As the 'vide-awake farmers mun see 'em no more;
They mun all be of iron, and wood there's no trade for;
Why what do fools thinken an ash tree were made for?
Gee ho Dobbin, &c.

"Talk o' plows made o' iron! why th' next thing they 'll do
As sure as you live, they'll be painting them blue.
Then they've two tits abreast, as they call a gee ho,
They may call long enough, but it never can go.
Gee ho Dobbin, &c.

"No! gi'e me a good wooden plow as is strong,
And a good pair o' big wheels to help it along,
And four long-tailed tits, a mon, and a lad,
And a good steady pace, and it shanner, be dad.
Gee ho Dobbin, &c.

"Then Tommy, my lad, never heed what they say,
But get on still, I' thy feyther's owd way,
They bring all their hogs to fine markets, I know,
But stick, while thee lives, to th' owd wooden plow."
Gee ho Dobbin, &c.

The Story-Teller.

A MAN WHO LOST HIS NAME.

[Continued from page 350.]

V.

In Norway the ladies dress with the innocent purpose of protecting themselves against the weather. If this purpose is still remotely present in the toilets of American women of to-day, it is, at all events, sufficiently disguised to challenge detection, very much like a primitive Sanscrit root in its French and English derivatives. This was the reflection which was uppermost in Halfdan's mind as Edith, ravishing to behold in the airy grace of her fragrant morning toilet, at the appointed time took her seat at his side before the piano. Her presence seemed so intense, so all-absorbing, that it left no thought for the music. A woman, with all the spiritual mysteries which that name implies, had always appeared to him rather a composite phenomenon, even apart from those varied accessories of dress in which, as by an inevitable analogy, she sees fit to express the inner multiformity of her being. Nevertheless, this former conception of his, when compared to that wonderful complexity of ethereal lines, colors, tints and half-tints which go to make up the modern New York girl, seemed inexpressibly simple, almost what plain arithmetic must appear to a man who has mastered calculus.

Edith had opened one of those small red-covered volumes of Chopin where the rich, wondrous melodies lie peacefully folded up like strange flowers in a herbarium. She began to play the *fantasia impromptu*, which ought to be dashed off at a single "heat," whose passionate impulse hurries it on breathlessly toward its abrupt *finale*. But Edith toiled considerably with her fingering, and blurred the keen edges of each swift phrase by her indistinct articulation. And still there was a sufficiently ardent intention in her play to save it from being a failure. She made a gesture of disgust when she had finished, shut the book, and let her hands drop crosswise in her lap.

"I only wanted to give you a proof of my incapacity," she said, turning her large luminous gaze upon her instructor, "in order to make you duly appreciate what you have undertaken. Now, tell me truly and honestly, *are* you not discouraged?"

"Not by any means," replied he, while the rapture of her presence rippled through his nerves; "you have fire enough in you to make an admirable musician. But your fingers, as yet, refuse to carry out your fine intentions. They only need discipline."

"And do you suppose you can discipline them? They are a fearfully obstinate set and cause me infinite mortification."

"Would you allow me to look at your hand?"

She raised her right hand and, with a sort of impulsive heedlessness, let it drop into his. An exclamation of surprise escaped him.

"If you will pardon me," he said, "it is a superb hand—a hand capable of performing miracles—musical miracles, I mean. Only look here"—(and he drew the fore and second fingers apart)—"so firmly set in the joint and still so flexible. I doubt if Liszt himself can boast a finer row of fingers. Your hands surely will not prevent you from becoming a second Von Bulow which, to my mind, means a good deal more than a second Liszt."

"Thank you; that is quite enough!" she exclaimed, with an incredulous laugh; "you have done bravely. That, at all events, throws the whole burden of responsibility upon myself, if I do not become a second somebody. I shall be perfectly satisfied, however, if you can only make me as good a musician as you are yourself, so that I can render a not too difficult piece without feeling all the while that I am committing sacrilege in mutilating the fine thoughts of some great composer."

"You are too modest; you do not——"

"No, no, I am not modest," she interrupted him with an impetuosity which startled him. "I beg of you not to persist in paying me compliments. I get too much of that cheap article elsewhere. I hate to be told that I am better than I know I am. If you are to do me any good by your instruction, you must be perfectly sincere toward me, and tell me plainly of my shortcomings. I promise you beforehand that I shall never be offended. There is my hand. Now, is it a bargain?"

His fingers closed involuntarily over the soft beautiful hand, and once more the luxury of her touch sent a thrill of delight through him.

"I have not been insincere," he murmured; "but I shall be on my guard in future, even against the appearance of insincerity."

"And when I play detestably, you will say so, and not smooth it over with unmeaning flatteries?"

"I will try."

"Very well, then; we shall get on well enough together. Do not imagine that this is a mere feminine whim of mine. I never was more in earnest. Men—and I believe foreigners to a greater degree than Americans—have the idea that women must be treated with gentle forbearance; that their follies, if they are foolish, must be glossed over with some polite name. They exert themselves to the utmost to make us mere playthings and, as such, contemptible both in our own eyes and in theirs. No sincere respect can exist where the truth has to be avoided. But the majority of American women are made of too stern a stuff to be dealt with in that way. They feel the lurking insincerity even where politeness forbids them to show it, and it makes them disgusted both with themselves and with the flatterer. And now you must pardon me for having spoken so plainly to you on so short an acquaintance; but you are a foreigner, and it may be an act of friendship to initiate you as soon as possible into our ways and customs."

He hardly knew what to answer. Her vehemence was so sudden and the sentiments she had uttered so different from those which he had habitually ascribed to women, that he could only sit and gaze at her in mute astonishment. He could not but admit that in the main she had judged him rightly, and that his own attitude and that of other men toward her sex, were based upon an implied assumption of superiority.

"I am afraid I have shocked you," she resumed, noticing the startled expression of his countenance. "But really it was quite inevitable, if we were at all to understand each other. You will forgive me, won't you?"

"Forgive!" stammered he; "I have nothing to forgive. It was only your merciless truthfulness which startled me. I rather owe you thanks, if you will allow me to be grateful to you. It seems an enviable privilege."

"Now," interrupted Edith, raising her forefinger in playful threat, "remember your promise."

The lesson was now continued without further interruption. When it was finished, a little girl, with her hair done up in curl-papers and a very stiffly starched dress, which stood out on all sides almost horizontally, entered, accompanied by Mrs. Van Kirk. Halfdan immediately recognized his acquaintance from the park, and it appeared to him a good omen that this child, whose friendly interest in him had warmed his heart in a moment when his fortunes seemed so desperate, should continue to be associated with his life on this new continent. Clara was evidently greatly impressed by the change in his appearance and could, with difficulty, be restrained from commenting upon it.

She proved a very apt scholar in music and enjoyed the lessons the more for her cordial liking of her teacher.

It will be necessary henceforth to omit the less significant details in the career of our friend "Mr. Birch." Before a month was past, he had firmly established himself in the favor of the different members of the Van Kirk family. Mrs. Van Kirk spoke of him to her lady visitors as "a perfect jewel," frequently leaving them in doubt as to whether he was a cook or a coachman. Edith apostrophised him to her fashionable friends as "a real genius," leaving a dim impression upon their minds of flowing locks, a shiny velvet jacket, slouched hat, defiant necktie and a general air of disreputable pretentiousness. Geniuses of the foreign type were never, in the estimation of fashionable New York society, what you would call "exactly nice," and against prejudices of this order no amount of argument will ever prevail. Clara, who had by this time discovered that her teacher possessed an inexhaustible fund of fairy stories, assured her playmates across the street that he was "just splendid," and frequently invited them over to listen to his wonderful tales. Mr. Van Kirk himself, of course, was non-committal, but paid the bills unmurmuringly.

Halfdan in the meanwhile was vainly struggling against his growing passion for Edith; but the more he rebelled the more hopelessly he found himself entangled in its inextricable net. The fly, as long as it keeps quiet in the spider's web, may for a moment forget its situation; but the least effort to escape is apt to frustrate itself and again reveal the imminent peril. Thus he too "kicked against the pricks," hoped, feared, rebelled against his destiny, and again, from sheer weariness, relapsed into a dull, benumbed apathy. In spite of her friendly sympathy, he never felt so keenly his alienism as in her presence. She accepted the spontaneous homage he paid her, sometimes with impatience, as something that was really beneath her notice; at other times she frankly recognized it, bantered him with his "Old World chivalry," which would soon evaporate in the practical American atmosphere, and called him her Viking, her knight and her faithful squire. But it never occurred to her to regard his devotion in a serious light, and to look upon him as a possible lover had evidently never entered her head.

As their intercourse grew more intimate, he had volunteered to read his favorite poets with her, and had gradually succeeded in imparting to her something of his own passionate liking for Heine and Bjornson. She had in return called his attention to the works of American authors who had hitherto been little more than names to him, and they had thus managed to be of mutual benefit to each other and to spend many a pleasant hour during the long winter afternoons in each other's company. But Edith had a very keen sense of humor and could hardly restrain her secret amusement when she heard him reading Longfellow's "Psalm of Life" and Poe's "Raven" (which had been familiar to her from babyhood), often with false accent, but always with intense enthusiasm. The reflection that he had had no part of his life in common with her—that he did not love the things which she loved—could not share her prejudices (and women have a feeling akin to contempt for a man who does not respond to their prejudices)—removed him at times almost beyond the reach of her sympathy.

It was interesting enough as long as the experience was novel, to be thus unconsciously exploring another person's mind and finding so many strange objects there; but after a while the thing began to assume an uncomfortably serious aspect, and then there seemed to be something almost terrible about it. At such times a call from a gentleman of her own nation—even though he were one of the placidly stupid type—would be a positive relief; she could abandon herself to the secure sense of being at home; she need fear no surprises, and in the smooth shallows of their talk there were no unsuspected depths to excite and baffle her ingenuity. And again, reverting in her thought to Halfdan, his conversational brilliancy would almost repel her, as something odious and un-American, the cheap result of outlandish birth and unrepublican education. Not that she had ever valued republicanism very highly; she was one of those who associated politics with noisy vulgarity in speech and dress, and therefore thanked fortune that women were permitted to keep aloof from it. But in the presence of this alien she found herself growing patriotic; that much-discussed abstraction, which we call our country (and which is nothing but the aggregate of all the slow and invisible influences which go toward making up our own being), became by degrees a very palpable and intelligible fact to her.

Frequently while her American self was thus loudly asserting itself, Edith inflicted many a cruel wound upon her foreign adorer. Once—it was the fourth of July, more than a year after Halfdan's arrival—a number of young ladies and gentlemen, after having listened to a patriotic oration, were invited in to an informal luncheon. While waiting, they naturally enough spent their time in singing national songs, and Halfdan's clear tenor did good service in keeping the straggling voices together. When they had finished, Edith went up to him and was quite effusive in her expressions of gratitude.

"I am sure we ought all to be very grateful to you, Mr. Birch," she said, "and I, for my part, can assure you that I am."

"Grateful! Why?" demanded Halfdan, looking quite unhappy.

"For singing *our* national songs, of course. Now, won't you sing one of your own, please? We should all be so delighted to hear how a Swedish—or Norwegian, is it?—national song sounds!"

"Yes, Mr. Birch, *do* sing a Swedish song," echoed several voices.

They, of course, did not even remotely suspect their own cruelty. He had, in his enthusiasm for the day, allowed himself to forget that he was not made of the same clay as they were, that he was an exile and a stranger, and must ever remain so; that he had no right to share their joy in the blessing of liberty. Edith had taken pains to dispel the happy illusion and had sent him once more whirling toward his cold native Pole. His passion came near choking him and, to conceal his impetuous emotion, he flung himself down on the piano-stool and struck some introductory chords with perhaps a little superfluous emphasis. Suddenly his voice burst out into the Swedish national anthem, "Our Land, our Land, our Fatherland," and the air shook and palpitated with strong martial melody. His indignation, his love and his misery, imparted strength to his voice, and its occasional tremble in the *piano* passages was something more than an artistic intention. He was loudly applauded as he arose, and the young ladies thronged about him to ask if he "wouldn't please write out the music for them."

Thus month after month passed by and every day brought its own misery. Mrs. Van Kirk's patronizing manners and ostentatious kindness, often tested his patience to the utmost. If he was guilty of an innocent witticism or a little quaintness of expression, she always assumed it to be a mistake of terms and corrected him with an air of benign superiority. At times, of course, her corrections were legitimate—as, for instance, when he spoke of *wearing* a cane instead of *carrying* one; but in nine cases out of ten the fault lay in her own lack of imagination and not in his ignorance of English.

On such occasions Edith often took pity on him, defended him against her mother's criticism and insisted that if this or that expression was not in common vogue, that was no reason why it should not be used, as it was perfectly grammatical and, moreover, in keeping with the spirit of the language. And he, listening passively in admiring silence to her argument, thanked her even for the momentary pain because it was followed by so great a happiness. For it was so sweet to be defended by Edith, to feel that he and she were standing together side by side against the outer world. Could he only show her in the old heroic manner how much he loved her! Would only some one that was dear to her die, so that he, in that breaking down of social barriers which follows a great calamity, might comfort her in her sorrow. Would she then, perhaps weeping, lean her wonderful head upon his breast, feeling but that he was a fellow mortal, who had a heart that was loyal and true, and forgetting, for one brief instant, that he was a foreigner? Then, to touch that delicate Elizabethan frill which wound itself so daintily about Edith's neck—what inconceivable rapture! But it was quite impossible. It could never be. These were selfish thoughts, no doubt; but they were a lover's selfishness and, as such, bore a close kinship to all that is purest and best in human nature.

It is one of the tragic facts of this life, that a relation so unequal as that which existed between Halfdan and Edith, is at all possible. As for Edith, I must admit that she was well aware that her teacher was in love with her. Women have wonderfully keen senses for phenomena of that kind, and it is no illusion if any one imagines, as our Norseman did, that he had locked his secret securely in the hidden chamber of his heart. In fleeting intonations, unconscious glances and attitudes, and through a hundred other channels, it will make its way out and the bereaved jailor may still clasp his key in fierce triumph, never knowing that he has been robbed.

It was of course no fault of Edith's that she had become possessed of Halfdan's heart-secret. She regarded it as on the whole rather an absurd affair and prized it very lightly. That a love so strong and yet so humble, so destitute of hope and still so unchanging, reverent and faithful, had something grand and touching in it, had never occurred to her. It is a truism to say that in our social code the value of a man's character is determined by his position; and fine traits in a foreigner (unless he should happen to be something very great) strike us rather as part of a supposed mental alienism and, as such, naturally suspicious. It is rather disgraceful than otherwise to have your music teacher in love with you, and critical friends will never quite banish the suspicion that you have encouraged him.

Edith had, in her first delight at the discovery of Halfdan's talent, frankly admitted him to a relation of apparent equality. He was a man of culture, had the manners and bearing of a gentleman, and had none of those theatrical airs which so often raise a sort of invisible wall between foreigners and Americans. Her mother, who loved to play the patron, especially to young men, had invited him to dinner parties and introduced him to their friends, until almost every one looked upon him as a *protege* of the family. He appeared so well in a parlor and had really such a distinguished presence, that it was a pleasure to look at him. He was remarkably free from those obnoxious traits which generalizing American travelers have led us to believe were inseparable from foreign birth; his finger-nails were in no way conspicuous; he did not—as a French count, a former adorer of Edith had done—indulge an unmasculine taste for diamond rings (possibly because he had none); his politeness was unobtrusive and subdued, and of his accent there was just enough left to give an agreeable color of individuality to his speech. But for all that, Edith could never quite rid herself of the impression that he was intensely un-American. There was a certain idyllic quiescence about him, a child-like directness and simplicity, and a total absence of "push," which were startlingly at variance with the spirit of American life.

An American could never have been content to remain in an inferior position without trying, in some way, to better his fortunes. But Halfdan could stand still and see, without the faintest stirring of envy, his plebeian friend Olson, whose education and talents could bear no comparison with his own, rise rapidly above him and apparently have no desire to emulate him. He could

sit on a cricket in a corner, with Clara on his lap, and two or three other little girls nestling about him, and tell them fairy stories by the hour, while his kindly face beamed with innocent happiness. And if Clara, to coax him into continuing the entertainment, offered to kiss him, his measure of joy was full. This fair child, with her affectionate ways and her confiding prattle, wound herself ever more closely about his homeless heart and he clung to her with a touching devotion. For she was the only one who seemed to be unconscious of the difference of blood, who had not yet learned that she was an American and he —a foreigner.—[To be continued.

THE EMPLOYMENT OF TIME.

The foundation of all economy is a wise disposition of time. Let that be acquired and true economy in everything else will infallibly and speedily follow; and the most difficult step toward acquiring it is real and wise economy of time. Economy has, in fact, got a very bad character with the great majority of people because it is confounded with stinginess; though, in fact, they are so far from being connected that stinginess is a very deadly enemy to real economy, while liberality and generosity must be confined to words and wishes where economy is not served.

Still some persons imagine that if they play the niggard with every cent and every article of which they can once obtain possession they are good economists. A more wretched and complete mistake cannot be made. Economy is the right employment of money and means, not the hoarding or burying of them. To save is very laudable and desirable, but it is no saving to lay up certain pieces of coin while we shiver for want of fuel or faint for want of the food which those pieces of coin would purchase; to do so is to save the coin, indeed, but it is to save it at the expense of that health and that duration of life which no amount of money can purchase or compensate for.

LOVE IN CALIFORNIA.

The evidence in the Edwards-Keating breach of promise suit, which has been stimulating the prurient curiosity of San Francisco, included a great many love-letters. On one occasion the defendant was so unreasonably amiable as to write:—"My Darling Emily: I would give all I have on earth and all of my future to be with you one-half hour." Although he seemed to be in a mood to mortgage time and eternity in consideration of a half-hour, she read the letter, seized a pen, and scolded him for being an "inconstant lunar"—whatever that may be. When the defendant received this missive he was watching the stock-market with anxious interest, and he had no time for romance. In other words, he was long of stock and short of sentiment. So he instructed his cashier to answer the letter. It was done in this wise:—"Mr. Keating directs me to say that they sin who tell us love can die; love is indestructible, but with life all other passions fly. Love's holy flame forever burneth; from heaven it came, to heaven it returneth. K. hopes to see you after the Spring rise." The Spring rise in stocks was what the buoyant proxy meant.

A GOOD HIT.

Prof. Ellicott Evans of Hamilton College, tells this story concerning his grand-uncle, Joseph Ellicott and the Chief Red Jacket:—The two having met at Tonawanda Swamp, they sat down on a log which happened to be convenient, both being near the middle. Presently Red Jacket said, in his almost unintelligible English, "Move along, Jo." Elliott did so, and the sachem moved up to him. In a few minutes came another request, "Move along, Jo," and again the agent complied and the chief followed. Scarcely had this been done when Red Jacket again said, "Move along, Jo." Much annoyed, but willing to humor him, and not seeing what he meant, Elliott complied, this time reaching the end of the log. But that was not sufficient, and presently the request was repeated for the fourth time, "Move along, Jo." "Why, man," angrily replied the agent, "I can't move any further without getting off from the log into the mud." "Ugh! Just so, white man. Want Indian move along—move along. Can't go no farther, but he say, 'move along.'"

SLUMBERING PLANTS.

It is well known that plants sleep at night; but their hours of sleeping are a matter of habit and may be disturbed artificially, just as a cock may be waked up to crow at untimely hours by the light of a lantern. A French chemist subjected a sensitive plant to an exceedingly trying course of discipline by completely changing its hours—exposing it to a bright light at night, so as to prevent sleep and put it into a dark room during the day. The plant appeared to be much puzzled and disturbed at first. It opened and closed its leaves irregularly, sometimes nodding, in spite of the artificial sun that shed its beams at midnight and sometimes waking up, from the force of habit, to find the chamber dark in spite of the time of day. Such are the trammels of use and wont. But after an obvious struggle the plant submitted to the change, and turned day into night without any apparent ill effects.

The Bible itself is like an old cremona; it has been played upon by the devotion of thousands of years, until every word and particle is public and tunable.—*Emerson.*

The Literary World.

RECENT LITERATURE.

Books for Holliday Presents.

How to Sing; Or, The Voice and How to Use It. By W. H. Daniell. New York: S. R. Wells & Co. (Paper—12mo. Price 50 cts.)

It may be necessary to convey information to the average reader upon scientific and practical subjects through the medium of a dialogue such as is here published. To waste the time necessary to acquire the knowledge upon the subject of the voice by swallowing whole this sugar-coated pill of science, seems like an acknowledgement of the bitterness of the medicine in this fast generation. The habit of dressing up subjects uninteresting to children in a childish way, is too prevalent. Those who are sufficiently advanced in years and desirous of information to seek the teachings contained in this work, should blush at the estimate put upon their common sense by its author and in most cases would vastly prefer a simple treatise upon the subject without the necessity of wading through one hundred and ten pages of dialogue to acquire a few pages of knowledge. This tendency to sugar-coating should be relegated to the Kinder-gartens and manufacturers of patent medicines and not have its application to scientific and practical subjects designed for the mature mind. That the book contains much valuable information upon the subject of the voice cannot be doubted; but it also contains much that is valueless and tiresome to the average mature reader.

Daisy Travers. By Adelaide F. Samuels. Boston: Lee & Shepard.

Among the many stories of young folks and their queer doings, few are more pleasing than Daisy Travers. Daisy is an orphan girl, whose good fortune caused her to be adopted by a wealthy gentleman who allowed her to do very much as she pleased and supplied her with the necessary funds for that end. Mindful of her own youthful poverty, she Quixotically established a boarding school called Hive Hall, into which she brought, for scholars, twenty-five children of both sexes, taken from miserably-conducted country poor-houses. The process of amelioration and the gradual development of their hitherto latent talents is brightly pictured, while the interest of the story centers around the civilization by kindly means of the veriest savage of them all, Dora Wentworth. The work is neatly printed, handsomely bound and illustrated with wood cuts. It will be a beautiful Christmas present for either the school-girl or boy, and one from which a good moral can be drawn with delight by the most mischievous of his or her race.

Elementary Hand-Book of Theoretical Mechanics. By William Rossiter. New York: G. P. Putnam's Sons. (16mo.—pp. 148. Price, 75 cts.

The word "elementary," refixed to the title of this work, is eminently a proper one, so simply and perspicuously are the rudiments or elementary principles of mechanics set forth. Accompanied by (143) illustrative diagrams, the book could hardly be other than useful to anyone who seeks knowledge on the subject of which it treats. Thousands of mechanics throughout the country to-day would be greatly benefited by a reference to its pages for a complete understanding of the reasons of results which they know to be produced but do not know why.

Flaxie Frizzle. By Sophie May. Boston: Lee & Shepard. New York: Charles T. Dillingham.

Another of those sweet, natural child-stories in which the heroine does and says just such things as actual, live, flesh children do, is the one before us. And what is still better, each incident points a moral. The illustrations are a great addition to the delight of the youthful reader. It is just such beautiful books as this which bring to our minds, in severe contrast, the youth's literature of our early days—the good little boy who died young and the bad little boy who went fishing on Sunday and died in prison, etc., etc., to the end of the threadbare, improbable chapter.

Choke-Bore Guns. By W. W. Greener. London, Paris and New York: Cassell, Petter & Galpin.

Mr. Greener is a manufacturer of guns at Birmingham, England, and has written a book entitled as above. If anyone thinks this British Cousin is Greener than most Yankees at advertising, let him peruse the 215 closely-printed pages, of which perhaps five or six are devoted to Chokebores in general and the balance to Greener's own gun. Anyone who desires to know all about this shooting-iron can here get over 200 pages of puffs, both original and copied from the London sporting papers.

Catalogue of Centennial Exposition. Philadelphia: J. R. Nagle & Co. for Centennial Catalogue Co.

A large, closely-printed work of over 1250 pages is in this instance made to comprise more extended and varied information than any which has come under our notice for a long time. Every exhibitor should possess himself of one and every one who has visited the Exhibition should, by this book, keep a constant reminder, as a prompter in case of conversation on so vast a subject. Two dollars will buy it, and it is certainly worth the money.

The Echo Club. By Bayard Taylor. Boston: James R. Osgood & Co.

The general character of this little work is described in the introduction:—"Three or four young authors found not only amusement but an agreeable relaxation from their graver tasks, in drawing names and also subjects as from a lottery-wheel, and improvising imitations of older and more renowned poets." Some of these parodies are comical, while others are exceeding dull. It is, nevertheless, a bright little pocket companion with which to while away odd leisure moments.

Elementary Hand-Book of Applied Mechanics. By William Rossiter. New York: G. P. Putnam's Sons. (16mo.—pp. 149. Price 75 cts.)

Divided into nine chapters, of which the first six treat of materials, the seventh of mechanical powers, the eighth of the application of force and the ninth of machinery, the work covers much ground in a condensed form. Supplemented to all this is a series of Problems and Solutions which must be valuable, especially to the inventor. Like all of the author's writings, simplicity and perspicuity are the prominent attributes of this work.

Liver Complaint, Nervous Dyspepsia and Headache. By M. L. Holbrook, M. D. New York: Wood & Holbrook.

Behold, here is a pathological work upon the reading of which the ordinary mortal can throw up his hat, for it is not filled with those horrid technical terms with which doctors delight to mystify outside barbarians. It contains an abundance of good sense and some good advice, that everybody can profit by. The doctor is the editor of the Herald of Health, and knows how to write as well as to prescribe.

Winwood Cliff. By Daniel Wise, D. D. Boston: Lee & Shepard. New York: Chas. T. Dillingham.

Among the various lists of holiday books none are more attractive for the youth of this country than that of the above publishers. Dr. Wise ("Francis Forrester") has in this work reduced a number of incidents of real life to a complete and pleasant story, the moral tone of which is maintained equally with its interest throughout. It is intended for the young and will please the adult also.

Elementary Book-Keeping. By J. C. Bryant, M. D. Published by the author at Buffalo, N. Y. (Pp. 96. Price 80 cts.)

The position of President of the Bryant & Stratton Business College, so long occupied by the author, is a sufficient guaranty of the value of this text-book. Appended to the system of book-keeping is a set of business forms applicable to those contingencies generally experienced by merchants. Every business man should keep this book in his store for reference.

Every-Day Topics. By J. G. Holland. New York: Scribner, Armstrong & Co

To the constant reader of Scribner's Monthly many of these "Briefs," as their author calls them, would be familiar. To those to whom they are new however, their freshness would amply repay perusal. Dr. Holland always writes well and his productions are carefully prepared and invariably contain ideas of value well expressed. Even these little "Briefs" are, many of them, prose-poems in themselves.

Lady Ernestine; Or, The Absent Lord of Rochefort. By Mrs. Catherine A. Warfield. Philadelphia: T. B. Peterson & Brothers.

For a book filled with unnatural situations, incomprehensible human conduct and execrable French, commend this one. But withal, it is interesting, and what plot there is in it is well worked out. To those who are pleased with sensational novels of the French Revolution, this would be good reading.

Manual of Geometry. By William G. Peck, LL.D. New York: A. S. Barnes & Co.

This is the last volume of Peck's "Mathematical Series" (condensed course). Beginning with "First Lessons in Numbers," he conducts the student through natural gradations to this work, in which the propositions are both complete and solved in a simple, clear way. An excellent text-book for advanced scholars.

Peter and Polly. By Marian Douglas. Boston: Jas. R. Osgood & Co.

The author has produced one of those pleasant tales of New England life during the Revolutionary War, which cannot fail to reach the true American heart. Though the central characters are children, the story is quite readable for older folks.

Popping the Question. Philadelphia: T. B. Peterson & Bro.

This is one of the usual novels of the day. Those whose tastes incline to love, intrigue and eventual happiness, will find this book extremely interesting.

BOOKS RECEIVED.

From Scribner, Armstrong & Co., New York:

Philip Nolan's Friends, by Edward E. Hall. (Cloth—pp. 395. Price $1.75.) Sans-Souci Series. Anecdote Biography of Shelley. Edited by R. H. Stoddard. (Cloth; 12mo—pp. 290. Price $1.50.)

A. S. Barnes & Co., New York:

Battles of the American Revolution—1775-1781, &c., by H. B. Carrington, M. A., LL.D., Col. U. S. Army. (Boards; pp. 712. Price $6.)

T. B. Peterson & Brothers, Phila., Pa.:

Popping the Question, by the author of The Jilt. (Paper—pp. 176. Price 75 cts.)

Magazines for December:

Wide Awake, St. Nicholas, Galaxy, Phrenological Journal, Journal of Materia Medica.

Sabbath Reading.

FROM MY WINDOW.

BY ALIQUA.

I look from my window with dreaming eyes
At the landscape fair and o'er-arching skies,
At the busy streets of the pleasant town,
And the noisy trains that go up and down,
At the birds that circle and wheel and fly
And vanish into the blue of the sky,
And I win from the days of storm and shine
Some fair fancies and thoughts to weave with mine.

I look from my window at early day
When mists of morning curl up and away
From the river course, where the hills in line
Like a row of happiest faces shine;
When out-going trains rumble loud and long,
And the traveler's heart beats high and strong,
For the farewells said in the morning air
Hold a hopeful promise, with hint of prayer.

I glance at the silent city between
My quiet street and the busier scene,
And in light of the morning strong and clear
Dark Death seems a shadow that comes not near.
I turn from the graves to the joy that lies
In the laughing depth of the baby's eyes,
And to lightsome tasks that the day begin
With a joyful heart to work and win.

I look from my window at eventide
When slow, dusky forms from the meadows glide
And circle the town with their pinions dun,
While the hills still catch the gleam of the sun,
And whistle of trains echoes long and far,
And there hangs in blue heaven the evening star,
While I fancy angels in blessing keep
A watch by the baby's peaceful sleep.

I look from my window at still night hour
When sweet sleep has vanished with magic power,
And only the gleaming marble I see
Of the silent city that waits for me,
And its solemn rest seems calm and sweet,
While the old petition my thoughts repeat:
"Bless us, and guide us, O Father afar!
By the light of thy Bright and Morning Star."

MAHOMMEDANISM vs. CHRISTIANITY.

The following, from the London Spectator, aptly describes a species with which we are all familiar:—"A kindred cause of English Mahommedanism comes from deep-seated, subtle, vehement, half-confessed and often only half-conscious hatred of Christianity. We all know the kind of educated man who, without openly attacking Christianity, never lets slip a chance of sneering at it; who goes out of his way to recount the atrocities that have been committed in its name; who lumps priests and parsons of all sects under the heading of some contemptuous epithet, and who habitually attacks Christianity by praising all other religions. Such men pay tributes of respect to Mahommed not because they like him, but because they hate the dominion of the Christian Church. They praise Mahommedanism and admire the morality of the Koran, for the most transparent of controversial purposes. In the present case, it is enough for them that much has been said about the Christianity of the Bulgarians; their dislike to the religions classes at home makes them instantly find in that Christianity a ground of contempt, and they go out of their way to show that the religious beliefs of the Bulgarians are pitiably corrupt. They forget to ask whether history has not shown that even the most corrupt Christianity, when connected with the stream of European progress, has proved to be a better civilizing agent than the most refined Mahommedanism."

FORCE.

God works through men. The gospel was first wrought into chosen men, and thus became a power to save other men. Christ was the life, the gospel, in his own person, and incarnated that gospel in apostles and repeats the incarnation in succession. No one can preach the gospel unless he has made it a personal life in his own soul. Doctrine is the mere anatomy of the gospel; life is the real power that renders all mental power, knowledge and truth, effective. Lack of life is the great weakness of pulpits and pews. There is an immense amount of knowledge, sincerity, generous intent and patient drudgery, but the fire is low, inspiration feeble. There is a desire to do "mighty works," but few get hold of the power. The way seems obscure; prayer and longings bring no enlightenment, and faintness stifles many souls. What can they do? When the "power of Christ" is dearer to them than everything else and they seek it with a great desire and strong faith, it will come.

THE ROMAN PONTIFFS.

The whole number of Popes from St. Peter to Pius IX. is 257. Of those 82 are venerated as saints, 33 having been martyred; 104 have been Romans and 103 natives of other parts of Italy; 15 Frenchmen, 9 Greeks, 7 Germans, 5 Asiatics, 3 Africans, 3 Spaniards, 2 Dalmatians, 1 Hebrew, 1 Thracian, 1 Dutchman, 1 Portugese, 1 Candiot and 1 Englishman. The name most commonly borne has been John; the 23d and last was a Neapolitan, raised to the chair in 1410. Nine Pontiffs have reigned less than one month, 30 less than one year, and 11 more than 20 years. Only 5 have occupied the Pontifical chair over 23 years. These are St. Peter, who was Supreme Pastor 25 years, 2 months, 7 days; Sylvester I., 23 years, 10 months, 27 days; Adrian I., 23 years, 10 months, 14 days; Pius IX., who celebrated his 30th year in the Pontifical chair June 16th, 1876.

Ladies' Portfolio.

MY SHIP COMES IN.

My ship comes sailing in from sea,
And I am glad as glad can be.
Oh! I have kissed my love to-night,
And all life seems one calm delight.
My ship comes in, my ship comes in,
My ship comes sailing up the sea,
And life is like a dream to me.

The stars look larger than before,
The moon is silver now. The door
Of Paradise seems opened wide
As you church door for my fair bride.
My ship comes in, my ship comes in,
My ship comes climbing up the sea,
And land and sea are fair to me.

I know full well in my ship's hold
Lie neither gorgeous silks nor gold;
But oh! I know my love loves me,
And ask no more of land or sea.
My ship comes in, my ship comes in,
My ship has crossed the lonesome sea,
And I am glad as glad can be.

[*Joaquin Miller.*

HARD TIMES.

This is the complaint we hear from nearly every one, and a great many are trying to economize. But how many men will think of giving up their cigars, their accustomed daily drinks, their dinners at clubs, and treating of friends and other useless and expensive habits? And how many women will dispense with dresses, so loaded with trimmings that the foundation of the dress is scarcely visible, and wear something plainer, more sensible and becoming?

Much sooner will many think of discontinuing the weekly papers, not buying the magazine they usually have, neglecting to bring home a new book to the family, and occasionally taking the boys from school, just as they are beginning the higher branches, to have them work for a pittance, perhaps, at this day too when education is thought so necessary, and skillful workers are wanted in every field of labor. The girls, too, must do without their music lessons. All these things must be given up, that are so really needed, instead of those that we would be better off without.

Economy might also be practiced in regard to our food, with great benefit to ourselves. Soup is as cheap, healthy, and nourishing as any thing; oatmeal, Graham flour, rice, and all coarse grains, are some of the best materials for bone and muscle; and with plenty of good, light bread, rolls and muffins, vegetables in abundance, eggs, beef, fowls and fish, what more can any one ask, except that which is so bountifully provided—fresh, ripe fruit. And if you have more than you can eat or preserve for winter's use of those cells of honied sweetness—grapes—or those garden rubies—called currants—or any fruit used for making wine—give them away—throw them away, do anything rather than make wine of them, thinking, because it is home-made, it can do no harm.

And do anything under the sun but make "brandy peaches." If you possess any of that delicious, velvety fruit. *Then*, if your sons learn to like ardent spirits, when they go out into the world—as they surely must one day, if they live—you can feel that you have been wholly blameless. Oh! mothers in this nation! you cannot keep your darling boys with you always, but now, while they are young, you can do almost everything in teaching them to hate evil and love the right. You can do it if you *will*; you can carefully educate them to a high moral standard, and then, if in after years they do learn to drink—although it will be dreadful—you will not have the fearful thought *forever haunting* you, that it was at home that they first learned to like the taste of intoxicating drink, and that it was a mother's hand that gave it to them.

The more plainly and sensibly we dress, the better it will be for us, both in mind and body. The less time we spend upon it, the more we shall have for something better; the less we think about it, the more our minds can be occupied with better thoughts, nobler feelings, and higher aspirations.

The books we read, the lessons we learn, the education we receive, all these we make our own. But the luxuries we have, the fine furniture, the expensive clothing, these last only for a time, are the least satisfying of all earthly blessings. But the self-sacrifice we make, the education we obtain *here*, make us better and happier in the life which now is and in that which is to come.

So do not let us give up our reading, music, pictures and lectures, our schools, and all the elevating influences of life. These are worth far more than mere outside show; the things that perish with the using.

Books and papers we cannot do without; music is one of our greatest blessings. Pictures of the right kind are refining and ennobling. It is not the promiscuous giving to street-beggars and tramps, but the true charity which helps the needy, worthy ones who try to help themselves, that is admirable.

What we want and actually need to-day is to educate the "coming army of voters" to *form* temperance PRINCIPLES. It is not enough to say: "I am in favor of temperance—I don't believe in men getting drunk: but such gentlemen as *we* are, certainly know when we have enough, we can be 'moderate drinkers.'" Ah! you don't know the influence you may possess over the younger boys of your community. Nearly every boy has some friend whom he thinks about right. If he sees his friend smoking, the first chance he gets he will try to learn to smoke, *to be manly*. A little boy joins a temperance society, signs the pledge, or becomes a member of a Cold Water Temple, and some young man—who may be a hero in his eyes—meets him and says: "I hear you've joined a *Cold Water Temple*. What kind of a concern is it? please tell me. And can't you drink anything but water this cold weather? Really, I thought better of you than *that*; I did not think a smart chap like *you* would sign away your liberty. Such simple societies are well enough for *girls*, but 'Young America' wants and must have '*independence!*'" You will have a remarkable kind of independence, one of these days, if you keep on at this rate, when your appetite controls you, instead of you controlling it, as you once boasted you could.

But I'm not writing a temperance article, and yet I am writing just that very thing, after all—temperance in all things producing a wise economy in those things we can best do without. There's one thing when you are trying to reduce expenses—to meet your income—that I beg you not to forget. While you are thinking of providing less reading matter for yourself and family, there's one class of papers, that, if you've been in the habit of taking, you had better have stopped at once, and *never* again send your subscription. It is those sensational, trashy Ledgers and Weeklies that are so largely circulated in the land today. They do more harm than good—in fact they do no one any good whatever. All the influence they do possess—and I hope it is not much, but fear it is—is for evil. I used to read them when I did not know any better, but soon became disgusted with them, and before finishing a thrilling (?) story I had commenced, carried them back to the neighbor that had offered them to me. I resolved I never would read that class of paper again, and I never have. If I could, at this moment, with one dash of my pen, blot them entirely at once and forever from our country, it should be done instantaneously.

Let us be economical in every right and proper way—stopping to think of the consequences, instead of practicing the glittering display that is worth so little, and will never benefit us in any respect. This is true economy, and the best cure for these "Hard Times." EUDOM.

Royalton, Niagara Co., N. Y.

FOR AND ABOUT WOMEN.

"How dairy!" exclaimed the milkmaid when the hired man kissed her.

QUEEN VICTORIA has received from the Empress of Brazil that dress woven from the webs of spiders.

YOUNG ladies, the new shade is "antique purple." It is about the tint of an election eye two days old.

THE Italian universities have never excluded women. Centuries ago they even elected them professors.

Two negro women met in Louisville by appointment, and fought with knives until both were painfully wounded.

THERE lives near Oakland, Cal., a real old-fashioned witch, who lives in a little hut, cooks and eats her meals in the public highway, and has three dogs for her only companions.

THE woman-women claim that at the recent election in Massachusetts 15,000 votes were recorded for woman suffrage and prohibition—an increase of 50 per cent. over last year.

THE local editor of the Burlington Hawkeye reports that "the false alarm of fire on Columbia street yesterday afternoon was caused by a young lady with cardinal-red stockings falling out of the back seat of an open wagon."

A LONDON woman gave her child a bottle of carbolic acid to play with so as to pacify it. The child got the cork out of the bottle, and as the little angels in heaven are supposed to enjoy the highest state of pacification, that mother's experiment was eminently successful.

THE characteristic of a coquette is affectation governed by whim; for as beauty, wit, good nature, politeness and health are sometimes affected by this creature, so are ugliness, folly, nonsense, ill nature, ill breeding and sickness put on by it in their turn. Its life is one constant lie, and the only rule by which you can form any judgment of them is that they are never what they seem to be.—*Fielding.*

CORRESPONDENTS are loud in praise of the Italian women just now. They have been prominent in the agitation throughout the country with reference to the Bulgarian outrages. The Countess Chiocci presented an address at a public meeting in Rome, on the 3d inst., and Miss Matilda Caselli addressed an enormous meeting at Naples a week afterward. The spirit and eloquence of the latter moved the vast audience to uncontrollable enthusiasm.

THE New York correspondent of the St. Louis Republican writes: "A pretty, wealthy girl, of good family, of this city, while recently in Philadelphia, struck the fancy of a Chinese merchant who was in charge of the Chinese exhibit at the Centennial. He openly expressed his admiration, said, 'I like you muchee, come see me muchee,' &c., and presented her with many novelties of Chinese manufacture, among them some beautiful scarfs of Canton crape. One of them is of dark crimson, peculiarly becoming to this pretty brunette. So she wears it in coquettish fashion about her throat, and tied in a long loop, which reaches below her waist. Suddenly all her female friends are in quest of these long Canton crape scarfs of crimson hue."

Reading for the Young.

LITTLE MAYSIE.

BY ANNIE L. JACK.

SHE is waiting—little MAYSIE;
I can see each shining curl,
And with joy her eyes are beaming—
Mother's sweet, old-fashioned girl.
For she kissed me when we parted,
With a tremor at her throat;
But her words were bright and happy—
"I will meet you at the boat."
Little MAYSIE, busy MAYSIE,
She has met me at the boat.

I have been in halls of learning
And the mansions of the proud,
But I wearied of their wisdom
And was lonely in a crowd.
Still in fancy I have listened
To our wildwood robin's note,
And to MAYSIE'S hopeful promise—
I will meet you at the boat.
Little MAYSIE, busy MAYSIE,
She has met me at the boat.

Now I see the low-browed cottage
Nestling 'mong the maple trees,
And the perfume of the roses
Mingles with the evening breeze.
Ne'er again my feet shall wander
To those stranger lands remote,
Nor will MAYSIE need to promise,
"I will meet you at the boat."
Little MAYSIE, busy MAYSIE,
She has met me at the boat.

A TRUE STORY;

Or, A BRAVE YOUNG LAD.

BY "GRETCHEN."

My grandfather was born among the hills of New Hampshire, where he spent the first eighteen years of his life. And many interesting and amusing incidents were crowded into these years, one of which, my dear young readers, I shall relate for your diversion.

From his cradle he had learned to believe that prowling wolves and prowling bears lived somewhere among those hills, and yet up to the age of fourteen he had seen nothing but the picture of a wild animal. He lived in hopes, however, of some day exercising that boldness and bravery which were among his characteristics. For with this shadow ever hanging over him, he had educated himself to the highest standard of courage and intrepidity, also studying the habits and natures of various animals.

There was none he dreaded so much as the catamount. When I say dreaded, I do not wish it to be inferred that he would try to avoid them; on the contrary, he was ever on the alert to find them. It was their cat-like, stealthy, treacherous nature that he despised. He would much rather have a paw-to-paw tussle (as he termed it) with a bear. "But beggars must not be choosers." Although giving little credence to the exaggerated stories of the neighborhood, there was a shadow of a reason for believing that catamounts or panthers inhabited those regions. Once or twice, while engaged in doing his evening chores at the barn, he had heard a yell or squall in the distance, which he well knew was foreign to the barn-yards of that locality, and which at once suggested these animals. The nearest settlement to his father's home was some six miles distant, reached only by two roads,—the main road winding along the base of the mountain; the other a narrow one which cut through it, making the distance shorter. It was seldom patronized, however, on account of its wildness, the steep ascents on either side looking very suspicious and forbidding.

Returning from mill late one afternoon, with his two bags of grist in front of him on his horse, he ventured to turn into this short cut, cherishing the hope at the same time that his suspicions might be verified, and that he might go home with a true story. He had gone about a mile when suddenly Dolly's ears flew back, and then as quickly straightened themselves out like flags of distress. He remembered hearing his father say that the pricking of Dolly's ears was enough warning when danger was at hand. He had watched and waited so long for that sign, and now that it had come it sent a thrill of terrible joy through him; and then for the first time he bethought himself of his recklessness, for he had not a thing with which to defend himself. Still he did not, coward like, put heels to his horse; he just straightened himself in his saddle, letting Dolly take her own gait, while he scanned either side of him. At first his ear caught sound of a cautious rustling; his eyes instantly turned in the direction from which it came. As I have said before, he was acquainted with the habits of wild animals only theoretically. The quietness and silence which prevailed convinced him at once that a catamount or panther (I believe they are one and the same—grandfather always called them catamounts) was near, and might at any moment pounce upon him. Keeping his eyes upon the spot whence the rustling issued, he saw a sleek gray creature steal slyly from a thick clump of wood and underbrush. It turned as if to spring.

Quick as thought he off with his cap, whirled it, then tossed it high in the air, feeling sure that the movement would distract its plans. You will say that you see no bravery in this. Yes, but was there not cunning and forethought? Does it not show that in any emergency he would be cool, and not cowardly? He admitted, however, that in this instance he was foolhardy, for he had rushed right into danger unguarded, and had it not been for his cap, he would have had nothing to aid him in his strategy. After riding a safe distance, he ventured to look back, and sure enough, there in the dim light and distance, he saw something in the middle of the road, being pretty roughly handled (by a lively-looking beast), which he had no reason to doubt was his cap.

This was enough. He put heels to Dolly, who seemed to take in her young master's feelings, for there was no let up to her, until she brought him safely around to the back door.

"Take the bags quick!" said he to his father, who came out to assist him. "I've a story *now* to tell, that you'll all believe, I guess."

"But where's your cap?" queried his father.

"Ah, 'there by hangs a tale.' Come in, while I call mother and the boys, and we will have it out." And so he recounted his adventure in a very few words, and the absence of his cap proved that something had happened.

This little incident stimulated him to action. The next morning, as soon as possible, he, together with his father and neighbors, went to the scene of action. And there was found proof enough, in the shape of shreds of a once very nice cap, to convince the most incredulous. Having provided themselves with more formidable weapons this time, they all took a holiday, saw signs and many tracks of wild beasts; and from that day grandfather says his fame began.

Being "doubly sure" now, that there must be lively times up in those mountains, off and on, he did not rest until he had had an encounter, not with a catamount, but a great she bear, of which I should like to tell you another time.

We always liked this story, though, because we thought it so cute in grandpa to think of throwing his cap up.

DISCOVERIES MADE BY ACCIDENT.

NOT a few discoveries in the arts and sciences have been made or suggested by accident. The use of the pendulum, suggested by the vibrating of a chandelier in a cathedral; the power of steam, intimated by the oscillating of the lid of a tea-kettle; the utility of coal-gas for light, experimented upon by an ordinary tobacco-pipe of white clay; the magnifying property of the lens, stumbled upon by an optician's apprentice while holding spectacle-glasses between his thumb and finger—are well-known instances in proof of the fact.

Galvanism was discovered by accident. Prof. Galvani of Bologna, in Italy, gave his name to the operation, but his wife is considered as actually entitled to the credit of the discovery. She being in bad health, some frogs were ordered for her. As they lay upon the table, skinned, she noticed that their limbs became strongly convulsed when near an electrical conductor. She called her husband's attention to the fact; he instituted a series of experiments, and in 1789 the galvanic battery was invented.

Eleven years later, with that discovery for his basis, Prof. Alessandro Volta, also an Italian, announced his discovery of the "voltaic pile."

The discovery of glass-making was effected by seeing the sand vitrified upon which a fire had been kindled.

Blancourt says that the making of plate-glass was suggested by the fact of a workman happening to break a crucible filled with melted glass. The fluid ran under one of the large flag-stones with which the floor was paved. On raising the stone to recover the glass, it was found in the form of a plate, such as could not be produced by the ordinary process of blowing.

Glass pearls, though among the most beautiful, inexpensive and common ornaments worn by the ladies, are produced by a very singular process. In 1656 a Venetian named Jaquin discovered that the scales of a fish called bleak-fish possessed the property of communicating a pearly hue to the water. He found by experimenting that beads dipped into this water assumed, when dried, the appearance of pearls. It proved, however, that the pearly coat, when placed outside, was easily rubbed off; and the next improvement was to make the beads hollow. The making of these beads is carried on to this day in Venice. The beads are all blown separately. By means of a small tube, the insides are delicately coated with the pearly liquid, and a waxed coating is placed over that. It requires the scales of four thousand fish to produce half a pint of the liquid, to which a small quantity of sal-ammoniac and isinglass are afterward added.

Lundy Foot, the celebrated snuff manufacturer, originally kept a small tobacconist shop at Limerick. One night his house, which was uninsured, was burned to the ground. As he contemplated the smoking ruins on the following morning in a state bordering on despair, some of the poorer neighbors, groping among the embers for what they could find, stumbled upon several canisters of unconsumed but half-baked snuff, which they tried, and found so pleasant to their noses that they soon loaded their waistcoat pockets with it. Lundy Foot, aroused from his stupor, imitated their example and took a pinch of his own properly, when he was struck by the superior pungency and flavor it had acquired from the great heat to which it had been exposed. Acting upon the hint, he took another house in a place called Black Yard, erected ovens and set about the manufacture of that high-dried commodity which soon became widely known as Black-Yard Snuff. Eventually he took a larger house in Dublin, and making his customers pay literally through the nose, amassed a great fortune by having been ruined.—*Oliver Optic.*

LETTERS FROM BOYS AND GIRLS.

My Pet Cat.

DEAR RURAL COUSINS:—I am too old to be admitted into your ranks and play marbles, jump a rope or roll a hoop, but I can enjoy your frolics as a spectator, if not joining in them personally. But I took up my pencil to tell you about my great pet cat, which is now lying fast asleep on the table before me. He is a noble fellow, six years old, and weighs sixteen pounds. He measures thirty-eight inches from the tip of his nose to the end of his tail, and around the body twenty-one inches. His color is Maltese and white, and very handsomely marked. I call him Schneider, after RIP VAN WINKLE'S dog, for we obtained him, when a little kitten, at Sleepy Hollow, on the Hudson. Now if any of the RURAL Cousins can show a bigger or better cat than my Schneider, I will tell them some true stories of his smart tricks. —ZACATUS.

Terrible!

MR. EDITOR:—For the first time I write. It is hard for me to start, but I will make an effort. I have had a very rough time this week. I fell off of the fence, hurt my arm and got a general bumping. About pets. Some one of the Cousins said he, she or it had a pet cat. I think a lamb would suit me. There was one of the RURAL Cousins who said something about the Centennial. Tell him to go on.—F. F. F.

The Puzzler.

ILLUSTRATED REBUS.

☞ Answer in two weeks.

ROMAN LETTER PUZZLES.

ROMAN letter puzzles consist of the Roman characters O, I, V, X, L, C, D, M. No other letters can be used. Please study the following puzzle, and it will seem quite easy:

What musical instrument is represented by 56? Answer, Viol.

V= 5
I= 1
O= 0
L=50
—
56

1.—What large bird (now extinct), an inhabitant of the island of Mauritius, is represented by 1,000?

2.—What state of the weather is represented by 650?

3.—What girl's plaything is represented by 600?

☞ Answer in two weeks. ALEX. BROWN, JR.

MISCELLANEOUS ENIGMA.

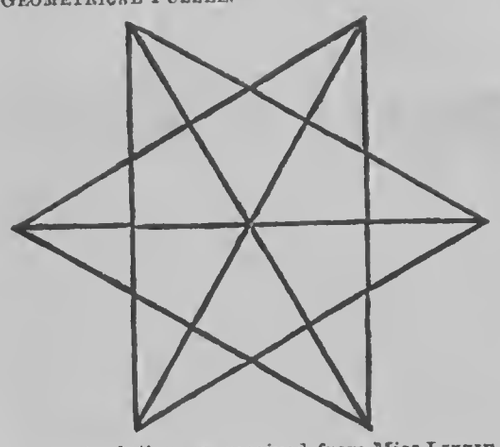
I AM composed of 21 letters:
My 3, 10, 7, 4, 9 a department of Government.
My 16, 14, 17 a Spanish title.
My 20, 6, 8 a verb denoting motion.
My 12, 15, 21 a character in one of Dickens' novels.
My 2, 10, 9, 8 the name of a college.
My 9, 2, 5, 21, 15, 11 the name of a noted author.
My 12, 14, 13, 1, 10 the platform of every sect.
My 19, 14, 12 is that in which we live and without which we can do nothing.
My whole are the last words of a song.

☞ Answer in two weeks. S.

PUZZLER ANSWERS.—Nov. 18.

MYTHOLOGICAL ENIGMA.—Poisoned arrows, without which Troy could not be taken.

GEOMETRICAL PUZZLE.—



A correct solution was received from Miss LIZZIE S. HUME, N. Y. City.

PUBLISHER'S NOTICES.

TO THE LADY READERS OF THE RURAL.

SPECIAL OFFER OF RARE PLANTS AND SEEDS

HAVING a few choice plants now growing in the RURAL'S EXPERIMENTAL GROUNDS, which we think would be desirable to some of the lady readers of the RURAL NEW-YORKER, we make the following offer:

Those who, in renewing their own subscription, send us an additional name (not already on our list) with the sum of $4.90 for the two, may select any two of the following-named plants and a paper of the seed of the Molucca Balm. Those who receive these premiums can divide with their friends, or keep them all, as they may agree among themselves, as our object in making the offer is to induce old subscribers to send us new ones, thereby increasing our list. The plants and seeds offered are very choice, as will be seen in description given below. The plants will be sent by mail free, and carefully packed and forwarded immediately on receipt of subscriptions.

Abutilon Boule de Neige.—The best of the *Abutilons*. Its flowers are large and white. It blooms throughout the whole year and therefore is alike desirable for the conservatory or garden. Its growth is rapid—small plants attaining the hight of five feet during the summer months. In the fall it may be cut back to any desirable size and potted for the winter, when it will quickly recover its symmetry and resume its ever-blooming habit. Its quick and exceeding popularity is a sufficient guarantee of its merits.

Marie Lemoine.—Among a hundred or more varieties of double-flowered *Pelargoniums*, new and old, this is as yet unrivaled. The individual flower, of a delicate rose color, as well as the truss, are the largest of their class. It is difficult to select a more attractive plant than Marie Lemoine when freely blooming. Every truss is in itself a bouquet. The leaves are large, zoneless, vigorous. The plant is compact and, like *Abutilon Boule de Neige*, is invaluable, either for the conservatory, window or garden.

Hydrangea paniculata grandiflora.—So much has been said of this new Japanese shrub during the past year that little need be added now. It has stood 26° below zero unharmed. It begins blooming in early August, continuing until after hard frosts. The thyrses of flowers, first greenish-white, then white, then rose, often measure a foot in length and twenty inches in circumference. Every stem being thus terminated, the striking appearance of an entire plant may be conceived. There can be no doubt that this is one of the most valuable of all perfectly hardy shrubs.

Variegated Ampelopsis or *Vitis heterophylla variegata*.—We do not hesitate to pronounce this one of the most attractive vines in cultivation. The leaves are deeply-lobed and variegated with white and green, much as *Abutilon Thomsoni* is variegated with green and yellow. From its racemes of flowers are formed fruit as large as currants, each one of which is a different color in shades of claret, azure-blue and green. These berries, which are first as soft as a currant, become finally as hard as bullets.

The pretty stems are also variegated, green, whitish and rose. The roots are perfectly hardy, and the vine's growth so rapid that it will cover twenty-five feet square in a season. For conservatory walls or pillars, for trellises or rockeries, it cannot fail to please. It has been growing in the RURAL EXPERIMENTAL GROUNDS for several years without the least protection.

Jerusalem Artichoke.—Believing that the Jerusalem artichokes are exceedingly valuable as food for nearly all kinds of farm stock, we place them among our valuable premium plants. They will yield more bushels of tubers per acre than the common potato and we believe them more valuable for feeding purposes, besides the artichoke will grow vigorously where the potato would fail entirely. We will send one-half pound of each of the Long Purple, and Round White, for each new subscriber as above, or one pound of the tubers of either variety. We shall store a quantity of the tubers in the cellar for sending out this winter; but those of our subscribers who reside north of the latitude of New York City, had better leave their plant premiums in our hands after the first of January until early spring. We will, however, "book" all orders received during the winter, to be sent at the earliest possible moment.

Achania malvaviscus or Malvaviscus arboreus.—The flowers are bright red of a turban shape two inches long. It blooms incessantly whether indoors or out. In the conservatory it may be trained so as to cover wood-work as readily as a vine. Its growth is so rapid that small plants set out in the spring will cover a space four feet in diameter by fall. As a plant for the sitting-room, the little care it needs, its perpetual scarlet flowers, contrasting elegantly with its golden-green, plush-like leaves—its endurance of dry heat and dust render it most pleasing and satisfactory. We commend this plant with confidence.

Moluccella laevis.—We will send, also, to ALL who are entitled to a choice of any two of the above plants, a package of the seeds of the singular Shell Flower, an account of which and an engraving were given in the RURAL of Aug. 17, p. 117.

TERMS FOR 1877, IN ADVANCE,

INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.50 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $11.25; Seven Copies, and one free, for $16.66; Ten Copies, and one free, $20—only $2 per copy. The above rates *include postage* (under the new law) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 25 cents extra for each subscription. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

News of the Week.

HOME NEWS PARAGRAPHS.

THE Trunk Lines are still at war.

Troops are being concentrated at Washington.

Tilden's official majority in Connecticut is 1,748.

A naturalized Chinaman voted in the Fourth Ward, San Francisco, on election day. When challenged by the inspector he took off his hat and swore in his vote like a Christian. The spectators were very anxious to know how he had voted, but he evidently regarded it as an important State secret and answered no questions.

American oysters, beef, apples, and cheese are luxuries at the leading hotels and restaurants in London.

The Presidential situation is already the monumental muddle of the century. Every day increases its ramifications.

A seminary for the religious education of natives of Norway has been opened at Madison, Wis.

A Mississippi woman left the cow that she was milking, and went right into the house, just because a bear rubbed against her.

Williams College will not be represented at the next meeting of the Inter-Collegiate Literary Association, owing to a lack of funds.

Union, Ky., has a child with a perfectly formed foot where a hand ought to be.

Mr. and Mrs. Yarborough were married in Hickman, Tenn., eight years ago. They were very young, and their engagement and wedding, managed by their parents, was devoid of sentiment. They were divorced a year afterward. This fall they met in Nashville. Mrs. Yarborough was yet only twenty-four years old, and had grown handsome. Mr. Yarborough had also improved in appearance. They fell in love; but this time her parents forbade the intimacy, and locked her in her room. He got her out through a window, they eloped, were chased by her angry father, were remarried, and now seem much better satisfied than when they were united without any row.

They are legally fighting for an elector in Oregon.

The official returns for Minnesota show the majority for Hayes to be 24,008. The three Republican Congressmen are elected by the following majorities: Dunnell, 8,945; Strait, 4,730; Stewart, 2,040.

The official returns for Oregon give Hayes 41,522 votes; Tilden, 38,449, and scattering, 74 Hayes's majority over Tilden, 3,073.

Gen. Crook's command reached Fort Reno on the 18th inst. in good condition and was paid off by Major Stanton. The weather is severe, but the troops are well prepared for a Winter campaign. One hundred Snake and Shoshone Indians joined the command at Fort Reno, making nearly 400 Indian allies in all, and the total strength of the command 2,000.

The Louisiana Returning Board is working slowly.

Cheese for export is lively.

Seven hundred and fifty thousand dollars in specie were withdrawn from the Bank of England, Nov. 24, for shipment to the United States.

A revolution has broken out in Lower California. Jose Moreno has collected a force and issued pronunciamentos declaring himself Governor. He has imprisoned Gov. Villagrana and his Secretary. Rodriques, seized the Custom House at Rio Juana, deposed Villagrana's Collector, and restored Caballar, who was removed some months ago. Many Mexicans have entered Lower California from California and joined Moreno.

The Canadians evidently fear that the Fenians meditate an invasion. The Canadian Government has sent Peter Smith of St. Armand, P. Q., Quartermaster of the Sixtieth Battalion of Canadian Volunteers, 10,000 rounds of musket cartridges so that he may be in readiness to distribute them to the battalion should it become necessary.

There are 90,000 tons of ice yet unsold on the Kennebec.

Now that Tweed and Woodward are among us, tremendous disclosures are impending.

Additional particulars of the attack on the James' boys, participants with the Younger brothers in the Northfield Bank robbery, have been received. The attack was made on Wednesday night by Sheriff Groom, of Clay county, and four men. It was very dark and rainy. The posse went to the home of the boys, four miles from Kearney, knowing they were there. Frank was seen, and as he saw the posse about the same time, he fired a shot in the air as a signal for Jesse. The Sheriff and one man fired at Frank without effect, when he returned the fire hitting the tree behind which the Sheriff was concealed. The boys then mounted their horses and got away shouting, "Come on, you sons of——." The Sheriff pursued, and on Thursday saw them at Cummings place, fourteen miles from Liberty, but could not overtake them. Nothing has been seen of them since, though men are scouring the country. Ed. Miller, a brother of Clel, who was killed at Northfield, and a man named Hoffman are supposed to have acted as spies for the James' boys, who are known to be working their way north.

FOREIGN NOTES.

THERE is more trouble in Mexico. Nothing whatever is known about the plans of General-in-Chief Martinez-Campos regarding the campaign. It appears that the Government purposes to keep his movements and plans as secret as possible, and some people even assert that the General has warned the newspapers not to publish anything without his special permission. He has thus far established no headquarters, but is paying flying visits in the towns called Cinco Villas, where it is reported that he is dealing summarily with suspected and convicted insurgents. Report says he has ordered a large number to be shot in Cienfuegos. He expects to clear the Cinco Villas of rebels in two months and will then pursue them beyond La Trocha. Recently, while Gen Martinez-Campos was on a railway train running between Sagua and Las Cruces the car containing his whole equipage was totally destroyed by fire. The cause of the fire is not given. The car also contained ammunition, which exploded, but it is said no damage was done. The arrest and imprisonment of suspected Cubans continue. Some of the arrested persons are lawyers; the greater part, however, are workmen.

The English in India are complaining bitterly that at a time when the public works are stopped for want of money, and the Government fears the loss of a tenth of its revenue from the decline in silver, two and a-half million dollars are to be spent in the ceremonial at Delhi in honor of Queen Victoria's assuming the title of Empress.

China has its big trees as well as California. About thirty miles from Nikko begins the longest avenue of shade trees in the world. These trees are sugi, or cedar, and are from five to seven feet in diameter at the base, and tower without a branch for fifty or eighty feet, and then lift their heads forty or fifty feet higher. They number thirty thousand, and were planted after the foundation of a shrine two hundred and fifty years ago.

Some French geographers are agitating the establishment of an observatory on the top of Mont Pio IX. in the Apennines to serve as the center of European meteorology. They propose to build a metallic chapel on the summit to which visitors will be conveyed from the foot of the rock in a captive balloon.

An idea of the prodigious zeal with which the fine arts are followed in France may be gained from the fact that the roll of students in the Paris Ecole des Beaux Arts for the present season comprises over 1,300 names—550 painters, 300 sculptors, and 480 architects.

It is stated that Russia has contracted with a German firm for the construction of 3,500 torpedoes.

The Czar has renewed his peaceful assurances to the Austrian Embassador.

A Cossack army of 30,000 men is expected to enter Servia.

The Sultan has abolished slave trade through out the Ottoman Empire.

The Duke di Galliera, the benefactor of Genoa, is dead.

The correspondent of The Daily News at Pesth says a telegram from Lemberg reports that even ordinary passenger traffic on the railway between Kiew and Odessa has been stopped. Russian troops are being removed from the Austrian frontier.

The departure of the Grand Duke Nicholas to assume command of the army in Southern Russia has been postponed.

The Times says:—A private telegram states that war fears are increasing all over the frontier of Cape Colony. Native affairs on both sides of the British borders are very unsatisfactory and are becoming critical.

The Erie is about to sue the Lake Shore for discriminating in rates against it in favor of the Central.

The Empire State has justified its name. It polled for President more than one million votes

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 25, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls.	108,892	Molasses	8,828
Whisky	3,761	Rice, bbls	419
Corn meal, bbls	3,092	Cut meats, pkgs	30,441
Corn meal, bags	483	Lard, pkgs	13,758
Wheat, bush	1,159,285	Tobacco, hhds	358
Corn, bush	585,342	do. pkgs	3,452
Oats, bush	357,871	Butter, pkgs	31,059
Rye, bush	68,944	Cheese, bxs	95,263
Malt, bush	24,317	Cotton, bales	44,446
Barley, bush	737,576	Rosin	5,780
Beans, bush	11,792	Spts. turp., bbls	921
Grass seed, bush	19,528	Dried Fruits, pkgs	3,827
Beef, pkgs	3,329	Eggs, bbls	7,741
Wool, bales	2,203	Peanuts, bags	377
Hops, bales	1,458	Leather, sides	71,188
Pork, bbls	6,503	Sugar, hhds	200
Tallow	2,860	Oil cake	8,032

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent properly from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival here of summer items on Saturday.

BEANS AND PEAS.—Exports beans past week, 1,273 bbls.; since Jan. 1, 52,560 do.; same time last year, 31,822 do.

Mediums remain strong and the fancy markets of new are higher. Strong prices have turned some attention to old stock, some pretty good of which are included in the receipts. Marrows have a better export demand and prices are somewhat favoring sellers. Other varieties of beans, including pea, are steady at full prices. California beans are on the way here. Canadian peas unchanged. Green peas easy. The better grades of B. E. peas are firm.

Beans—New medium, $2@2.05; do. marrow, $2.25@2.30; do. pea, $2.35@2.40; white kidney, $2.30@2.35; red do., $2.30@2.35; Old Beans—Medium, prime, $1.80@1.90; other, $1.60@1.75; marrow, $1.80@2.20; pea, prime, $1.90@2.20; white kidney, prime, $1.80@2.10; red do., prime, $1.90@2.10; black, $2.50@2.65; Canadian peas, new, ₱ bbl., tree, $1.12@1.14; do. bulk, 92@93c.; green do., new, $1.40@1.45; do., S. B. E. peas (2-bush. bag), $2.10@2.15.

BEESWAX.—Small sales are making at 30@31c. for Western and 30½@32c. for Southern.

Exports past week, 6,344 lbs., since Jan. 1st, 71,590 do.; same time last year, 88,860 do.

BROOM CORN—Is still hard to sell and prices unsettled.

Quoted at 7@8c. for short green brush, 6½@7½c. for green hurl, 5@6c. for medium green, and 3@4c. for red and red-tipped.

BUTTER.—State butter has not moved as readily as the second fall month should show, and without a real decline prices have a weak tone. Business for all grades of State is mainly at the inside range. For the fine grades of State, dealers think that a short period of steady business will allow the market to regain former extremes. The under are not spoken of so confidently. The accumulation in store and abundance yet to come, point to easy quotations when wholesale buyers can be induced to operate. Large quantities of butter in dairy lots are here in the hands of owners. The delay which occurs to sale when butter is so offered, also tends to temporarily depress the market. Best Western has as before met with a ready sale, common half tubs and rolls are dull. Exporters have added something to late business. Low grades of butter drag. Packers seem to want a better style than formerly.

Exports past week 3,500 pkgs.

We quote:—Choice pails, 33@34c.; prime, 32@33c.; poor to good, 24@29c.; creamery pails, choice, 35@36c.; good, 33@34c.; sweet cream pails, 30@35c. State firkins, choice, 29@30c.; fair to good, 25@28c.; do. half firkin tubs, choice, 32@33c.; fair to prime, 26@30c.; do. Welsh tubs, choice, 30@31c.; other, 24@28c.; inferior State, 15@19c.; Western creamery, choice, 34@35c.; other, 31@33c.; do. firkins, best, 29@32c.; other, 15@18c.; dairy tubs, choice, 24@26c.; other, 15@18c.; factory choice, 22@24c.; other, 14@18c.

State dairies quotable at 30@31c. with fall tubs Welsh tubs, dairies, 26@29c.

State firkins dairies 25@30c. Roll butter, fair to prime, 21@23c.; do., poor, 18@20c.

CHEESE.—This has been the most satisfactory week's business in some little time. The Liverpool market has been creeping up day by day, and supplies have been encouraging to full dealings. They have wanted chiefly the choicest colored factories, but have been forced by the received offerings of this grade to fill out their orders on other parcels of fancy. Sales are quite general at 13½@14½c. for the choicest colored, and on some special lots to 15c., with the best fancy white going at 14½@14⅝c. These figures showing a marked advance on the rates current last week, other grades have worked up in sympathy, but are not active. Towards the close the whole market is affected by the trouble in getting ocean freight accommodation, as relating to the extent of business.

Exports past week, 37,897 boxes, Cable quotation, 65s.

Fancy factory at 14¼@14¾c. for fancy white and colored; do., job lots, 15¼c.; good and prime, 13¾@14c.; fair, 11@12¾c. State farm dairy, fancy, 13¼@13¾c.; good to prime, 12@13c.; fair and good, 11@12c. Western factory, fancy, 13¾@14c.; good and prime, 12@13c.; fair lots, 10@11c.

COTTON. Prices have fluctuated sharply and closed weak on the heavy past arrivals and limited export demand.

The latest quotations are:—November, 12c.; December, 12 1-32c.; January, 12 3-16@12 7-32c.; February, 12⅝c.; March, 12 17-32@12 9-16c.; April, 12 23-32@12¾c.; May, 12¾@12 29-32c.; June, 13 1-32@13 1-16c.; July, 13 3-16c.; August, 13¼@13 9-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	10¾	10¾	10¾	10¾

DRIED FRUITS.—For apples trade was never in worse shape than now; supplies continue to pour in, adding to our already large stock, while requirements are light, the exceptionally low prices failing to induce very material life to the export trade—Peaches are still very scarce and favor the seller, as also small fruits generally.

Apples—State, sliced, 5¾ @ 6¼c.; do., quarters, 6 @6¼c.; Southern sliced, new, fair, 5@5½c.; choice do. 6¾c.; fancy, nominal; do., new quarters, in bags, 4@ 4½c.; do. repacked, 5@5½c.; Western quarters 5½c. Blackberries at 8¾@8½c. Peeled peaches, new, at 18@19c.; unpeeled peaches, halves, 9@10c.; do. quarters, 8½@9c. Raspberries, 28@29c. Cherries, 17½c.

Exports past week 5,165 bbls. apples; since Jan. 1st, 26,297 do., same time last year, 10,622 do.

EGGS.—Trade has been moderate, but a good start is expected for Thanksgiving and sellers adhere to former prices. Western are quite as good as State. Limed are dull but cooler weather will help to put them in use. We quote:

Near points, 33 @ 34c.; State and Penn., 28 @ 29c.; Western, prime, 28@28½c.; do. other, 27½c.; Canadian, 27½@28c.

State limed, 21@22c.; Western, do., 18@21c.

ESSENTIAL OILS.—We learn of no change.

Peppermint, $2.50 ₱ lb. in tin, $3.25@3.50 in glass—tone firm. Sassafras scarce and firm at 50c. ₱ lb. Wintergreen, large supply, weak at $2.50. Spearmint, nominally $2.30 ₱ lb.; no demand.

FLOUR.—There has been a liberal demand for the low grades suited to wants of shippers, and a good business in winter wheat product, Minnesota extras, Superfine and No. 2, with the whole market higher and very strong.

The latest sales are $4.60@5.25 for poor to very choice superfine State; $5.40@5.50 for very common to fair extra do.; $5.55@5.85 for good extra do $5.70@5.75 for fancy do., and $5.80@7 for fancy to very choice extra; $4.60@5.25 for superfine Michigan, Indiana, Iowa, &c.; $5.40@5.65 for shipping extra do., the inside price for inferior, and $5.80@5.70 for choice to very fancy extra do.; common to choice white wheat extras, $5.75@6.90; fancy do. $6.95@8; winter wheat, good to choice family, $6.25@8.25; round-hoop Ohio, $5.60@5.50, and trade brands of do. at $5.55@7; St. Louis, $5.40@6.30 for common to fair extra, and $6.55@8.25 for good to very choice; Minnesota "straight" at $6.35@7.35, and patent at $7.50@9.50; unsound stock at from $3.75@5.50; city mill extra for West Indies at $6.25@6.50; do. English brands, $5.35@—; do. trade and family, $7.00@8.50; No. 2 at $3.65@4.40.

FRESH FRUITS.—Exports of apples past week, 17,700 bbls. There is less local activity in apples, but exporters have moved a good many. For the fancy red table sorts there is an upward tone, but there is an abundance of good cheap stock. A few Boston pears are quotable at $2¼4.50 ₱ box; California range at $3@3.50 for the winter sorts. Cranberries begin to sell, and after the 30th we may look for a steady demand. Catawba grapes sell well; Isabella not wanted. Florida oranges turn out well this season. Chestnuts are mostly spoiled. Peanuts firm. Coarse hickory nuts, 75c.@$1; prime shellbark, $2@2.25.

Apples, State, ₱ bbl., prime red, $1.40@1.75; winter, $1.37@1.50; mixed, $1.12@1.25; good to fair, 50c@$1. Quinces, ₱ bbl., $8@12. California Quinces, $4@6 ₱ box; Cranberries, crates, $2.50@3.00; Eastern, good to prime, $7.50@10; N. J. $7.50@8.50, for good to prime. Grapes—Catawba, ₱ lb., 9@10c.; Isabella, 16@c. Peanuts—Va., fancy, $1.30@1.35; other, 90c.@$1.20. Oranges—Louisiana, $4 bbl., $6; Florida, box, $5.

FURS AND SKINS.—Several lists of quotations have appeared, but there are no definite rates to give thus early. We will publish our valuable table when the time serves.

GRAIN.—For wheat there has been a liberal demand from shippers, and prices are higher and very strong. Latest sales are of ungraded spring at $1.32; rejected spring at $1.05; No. 3 Milwaukee spring at $1.23; No. 2 Milwaukee spring at $1.32; No. 2 Minnesota spring at $1.33; Canada spring at $1.32; New York No. 1 spring at $1.30; No. 1 Chicago spring at $1.35; No. 2 Sheboygan spring at $1.32; No. 3 Chicago spring at $1.21@1.22; winter and red Western at $1.29@130, and white Michigan at $1.40. Rye is wanted by shippers at the higher prices quoted. Sales at 82@86c. for State and 92@96c. for Western, Canada and Jersey. Barley is weak and dull; choice ungraded Canada at $1.17. Corn is little lower and dull. Sales at 54@54¾c. for new New York "no grade" do.; 56@56½c. for new steamer mixed; 58@58½c. for old do.; 58¾@59c. for old New York mixed; 58¼59c. for New York low mixed; 60c. for New York No. 2; 50@60¼c. for New York No. 1. Oats are fairly active at 33@48c. for mixed, Western and State, and 38@50c. for white do.

HAY AND STRAW.—The receipts have been larger while demand has not increased materially; still prices are not disturbed.

Bale hay 80c. for shipping; 70@90c. for retail qualities; clover, 55@65c.; salt, do., 35@60c. Straw quoted at 70@75c. for long rye; 55@60c. for short rye, and 45@55c. for oat. Exports past week 515 bales; since Jan. 1st, 38,750 do.; same time last year, 37,825 do.

HIGHWINES.—Bring $1.09¼ ₱ gallon.

HOPS.—Receipts for the week have exceeded exports materially, the latter reaching only 1,000 bales. With a dull condition of trade as respects both shipping and brewers' requirements, prices have been very much unsettled and lower—for most descriptions 2 to 5c. off the rates of last week, the most serious decline being on the low grades of Western. We quote:

New Yorks, good to choice, new	31 to 73
New Yorks, low to fair, new	20 to 25
Eastern, new	27 to 30
Wisconsin, new	20 to 25
Yearlings	10 to 15
Olds, all growths	4 to 8
California, new	30 to 36

HONEY.—Prices keep low. The experience of the previous dull season checks holders from advancing prices even when activity warrants it. We quote: W. clover, comb, 15@20c.; B. W., do., 10@14c.; dark strained, 9@11c.; light do., 13@15c.

OIL CAKE.—Small lots of Western have been sold at $38.50.

POULTRY AND GAME.—Live poultry dull, and not wanted, even at the low figures.

New Jersey turkeys, 10@11c. ₱ lb.; Western, 9@10c. N. J. fowls and chicks, 10@—c.; State and Penn., 10@11c.; Western, 9@—c., roosters, 6@7c. Geese, N. J., ₱ pair, $1.75@2; Western, $1.37@1.62. Ducks, N. J., ₱ pair, 62@87c.; Western, 50@65c. Live pigeons, ₱ pair, 25c.

Dressed poultry has arrived moderately, but former receipts have kept the market overstocked with low qualities. The market can hardly settle until the rough, stale lots are disposed of.

Turkeys, N. J., 11@15c.; State, 10@14c.; Western, 10@13c. Chickens, dry-picked, 12@15c. N. J. chicks, 11@14c.; State, 10@13c.; Western, 10@13c. Ducks, N. J., 11@14c.; State, 10@11c.; Western, 9@12c. Geese, 5@10c. for common; 11@13c. for good to best. Inferior poultry, 4@7c.

Game has generally suffered from a warm journey, and prices for all items are easy. Wild ducks slightly improved. Drawn grouse, 50@60c.

We quote.—Canvas-back ducks $1@1.25; Red Head 60@65c.; Mallard 55@60c.; Teal 50c.; Widgeon, 30@35c.; common 30@40c.

English Snipe, ₱ doz. $1@—. Quail, ₱ doz., prime, $1.12½1.37. Partridge, State, 70@80; Eastern, 90@50c.; Western, 65@75c.; Prairie Hens, 80@85c.; Hares, 40@50c.; Rabbits, 20@30c. Venison, whole, 10@11c.; long saddle, 13@14c.; short do., 15@16c.

PROVISIONS.—Export demand has been moderate and the larger arrivals of hogs at the west have weakened prices. Mess pork quoted at $17 for spot and $16.30 for December and January deliveries. Bacon at 9c. for long clear and 9¼c. for short clear; with long and short clear together for December delivery quoted at 8¾c. Western steam lard at $10.50 on spot; $10@17¼c. for December and January. Stearine at 10½c. for prime. Tallow at 8½c. for prime. Beef hams at $20 for choice Western.

Beef, barreled lots, new, quoted at $10.50@11.50 for plain mess, $12@12.50 for extra mess, $13.50@14 for packet. Tierced quoted nominally at $19@21 for new prime mess and $21@25 for new India mess. City extra India mess at $27.

SEEDS.—Grass have been in large supply and have yielded a little as to price with, at the concessions, a fair export demand. Clover quoted at 15¾@15¾c. ₱ lb., and timothy at $1.30@1.35 ₱ bushel.

SUNDRIES.—Western live geese feathers prime white Western, 55@58c; mixed, 40@50c.; hen and turkey feather not wanted. Cider unchanged; 8@12c.; quality better. Ginseng, $1@1.20.

TOBACCO.—There have been very light export requirements, but supplies are not urgently offered, and prices are as before.

VEGETABLES.—Exports of potatoes past week, 3,400 bbls.; of onions, 509 do. Potatoes show a moderate advance; market firm at the new figures. A load of Nova Scotia sold at $2.62. Squash are in demand with Hubbard added to the best. Prime white and red onions are steady; yellow without demand.

Potatoes—Peach Blows ₱ bbl. $3.12@3.87. Early Rose, prime, $3.12@3.27; Peerless and Jackson white, 2.50@2.75 sweet, Del. $3.00@4; Va. $2.75@3. Cabbages, ₱ 100, $4@7. Marrow squash, ₱ bbl., $1@1.25. Hubbard Squash $1.50@1.75. New Russian turnips, ₱ bush., 75c.@—. Onions—Yellow, ₱ bbl., $1.75@2.00; white, $2.50@2.75; red, $1.50@1.75. Cauliflower, ₱ bbl.; $1@1.50.

WOOL.—The fall clips of California and Texas have been in very fair receipt, and those offering the most liberal assortments have had most attention. Western fleeces, however, have a very fairly inquiry. The whole market is very strong and is fairly active, well distributed on manufacturing account and, to a light extent, a demand on speculative account. The quotations are for—

Mill feed strong at $14 for shorts, $16 for middlings, and $20 for mixed. Railroad Freights—Flour to Boston, 35c. ₱ bbl.; to New York, 25c.; to Albany, 20c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Nov. 25, 1876.

THERE has been an active market this week and prices are better. Between 400 and 500 boxes of farm dairy cheese were on delivery and sales were made at 11@13c., according to quality. Factories were well represented, the offerings aggregating about 8,000 boxes, of which from 4,000 to 5,000 changed hands. Sales went up from 13 to 13¼@13½c., and one lot of 400 touched 14c. Nearly all the cheese on delivery was of October make and most of it very fine.

Butter is coming forward freely and sales have been made at 21@28c. for fair to good lots, while fancy went at 29@30c.

The weather is extremely mild;—no snow and but little frost. We have had some heavy showers of rain during the week, but the springs and streams are still low, and we are needing much more rain before winter sets in.

We have advices from abroad to the 6th of November. Our London correspondent says that there is a good demand for English, Dutch and faultless American cheese. Secondary sorts are slow of sale and extra fine is ver scarce. We give quotations as follows:

American, extra fine, 63@79s.; fine, 65@67s.; good, 50@56s.; secondary and low grades, 30@48s. English cheddar brings from 76@90s.; Wiltshire double, 66@74s.; Cheshire medium, 56@66s.; fine, 76@86s.; Scotch, 66@76s.

The demand for butter is limited to the finest Continental, Canadian and Carlows, the latter now taken by town houses. The sale of oleomargarine increases and is taken at 104s. in preference to secondary and inferior sorts. The prices are as follows: Clonmels, 146@160s.; Corks, 144@158s.; Doraets, 174s.; Jersey, 136s.; Swedish, 164s.; Normandy, 120@164s.; American and Canadian, 100@130s. Oleomargarine sells at 90@104s. ₱ cwt.

LIVE STOCK MARKETS.

" last week	10,239	55	1,319	17,947	22,949

BEEVES.—Trade on last Monday opened moderately easy at one-half cent ₱ lb. reduction on steers, ranging from fair to good, and three-quarter cent. strong, on inferior quality beeves. Prices were 7¾@10¾c. ₱ lb.; weights, 5¾@9¾ cwt. The quality of the herds to hand was rather rough. Wednesday, trade was slightly improved in feeling, owing to there being a light run; prices did not advance; sales ranged from 8@10¾c. ₱ lb.; weights, 5@10 cwt. Thursday, trade fair, at 7½@10¾c.; weights, 5@9¾ cwt. Friday, the markets closed fair at 8@10¾c.; weights, 6@8¾ cwt. Spanish herds, direct from the Plains, sold at 7¾@8¾c. Native steers, 7½@9¾c., with a few corn-fed at 9¾@10c.; grade do., 10@10¾c., with two car loads at 11c. ₱ lb. Mixed herds, 7¾@9¾c. ₱ lb. Oxen at 7¾@9¾c. Bulls, live weight, $4.50@4.80 ₱ cwt. Yearling bulls, 3¾@5c. ₱ lb. Dry cows, 8@9¾c.

MILCH COWS.—Trade fair in fresh cows of fair quality, which continue scarce. Poor quality cows held on sale. Nine cows sold at $42@55 ₱ head; 7 cows at $60@60; 10 cows at $57.50@75; 3 cows at $65; 1 cow for $30—calves always included.

VEALS AND CALVES.—Smooth quality veals scarce and in moderate demand. Coarse quality veals in over supply and slow of sale. State veals, 8@10¾c.; Jersey do., 8¾@10c.; Pennsylvania do., 9@10c.; Canada do., 7@9¾c.; Western do., 7@8¾c. State calves, grass-fed, 3¾@5c., also at $6.50@11.25 ₱ head. One calf from Canada, $17.

SHEEP AND LAMBS.—Trade moderate; quality, from coarse to choice. Monday, sheep sold at 4¾@6¾c. ₱ lb.; lambs at 5¾@6¾c. Wednesday, sheep, 4@6¾c.; lambs, 5@@7c. Thursday, sheep, 4@6c.; lambs, 5@6¾c. Friday, sheep, 3¾@5¾c.; lambs, 5¾@6¾c. The markets closed dull. Michigan sheep sold at 5@6¾c.; Illinois do., 4¾@5c.; Ohio do., 4@6¾c.; Canada do., 5¾@6¾c.; State do., 4¾@6¾c. Jersey ewes, 4@4¾c. Michigan lambs, 5¾c.; State do., 5@6¾c.; Canada do., 6@6¾c. Mixed flocks, 5@6¾c.

HOGS.—One single deck of State hogs, live weight, 185 lbs., ₱ head, sold at 6¾c. ₱ lb. Five car loads of Ohio hogs, live weight, 230@212@197 lbs. ₱ head sold at 6c. ₱ lb. One car load and one single deck of Ohio hogs, live weights, 283@219 lbs. ₱ head, $.90 ₱ cwt. City dressed in moderate demand. Extreme range, 6¾@7¾c. ₱ lb., with selected light weight pigs at 8c.

HORSE MARKET.—City trade has increased in volume, but not improved in rates. Sixty head, poor quality, light harness horses sold at $38@92 ₱ head; 50 do., $55@100; 45 do. ordinary quality, $110@175; 14 roadsters, with fair trotting action, not warranted sound, sold at $250@400 ₱ head; 9 broughams horses, course quality, $285@301 ₱ head; 9 pairs family carriage horses, $325@515 ₱ pair; 3 pairs stylish carriage horses, $500@750 ₱ pair, all aged; 3 pairs do., warranted sound, 6 years old, $1,200 ₱ pair; 5 saddle horses, poor quality, 90@200 ₱ head; 1 do., choice quality, $700; Staten Island horses sold at $125@210 ₱ head; street railway horses at $80@150 ₱ head; 16 horses arrived ₱ Erie Railway via Oak Cliff Station.

CARLYLE calls Darwin an atheist with very little intellect.

THE Danbury News calls Bob Ingersoll the Victor Hugo of American politics.

AND now they say that President Chadbourne of Williams will not resign his post.

STEVE KIRKSEY of Mayfield, Ky., put a package of gunpowder on a hot anvil. He is bald-headed now.

MR. PIERREPONT, Minister, etc., has been made an honorary member of the Reform Club in London.

A BAPTIST minister has sued a church committee at Oakland, Cal., for libel. Damages, $100,000.

PETER COOPER has about 16,000 votes in Illinois. Thus it would appear Illinois is the banner greenback State.

DR. LE MOYNE of the Pennsylvania cremation furnace was once a candidate for the Vice-Presidency on the Abolition ticket.

COUNT ARNIM, on the eve of his recent condemnation, sold to his son his last remaining great estate in Prussia for $600,000.

IN Newburyport, Mass., a sovereign voted for the first time in fifty-five years. He was a sailor, and his business had kept him from the polls.

THE only way to distinguish a mushroom from a toadstool is by eating the specimen. If you live it is a mushroom; if you die it is a toadstool.

THERE are no Smiths in the British peerage now. Lord Carrington's family have become Carringtons, and the Smiths, Viscounts Strangford, are extinct.

WASH WARREN of Griffin, Ga., is 70 years old. He has a young third wife and a new baby—a girl, whom he has named Lucinda Nancy Matilda, after the three wives.

MRS. F. WORCESTER of Grafton, Mass., has been awarded the first premium for the best committee report at the fair of the Worcester South-East Agricultural Society.

MR. CALEB CUSHING, say the admiring people of Newburyport, can hardly return to Spain, because his professional services are so frantically demanded by the litigious.

MR. WILLIAM BLACK came over here in quest of local color for a new novel, the stately Athenæum says:—A visit of a few weeks for the acquisition of local color!

THE good people who borrowed trouble because the campaign opened so late and languidly are now in distress because it refuses quietly and suddenly to come to an end.

MR. STEPHENS has been journeying to Washington by easy stages. He has rheumatism in his feet and legs, but his mind is as bright as ever, and he is cheerful and hopeful.

MRS. ROSE HAWTHORNE LATHROP, Hawthorne's small, fair-haired daughter, has taken to the unprofitable work of verse-writing. She has some musical ones in The Independent.

SOUND the loud timbrel
O'er Egypt's dark sea,
If ——'s elected—
There's an office for me.

PROF. SWING, who, if he were an Indian, would probably be called The-man-with-a-mind-of-his-own, is going to have a church edifice. Members of his congregation are busying themselves in the matter.

IF ninety per cent. of the inmates of our prisons are drinkers of ardent spirits, as estimated by those in positions that give weight to their judgment, the way in which taxation may be reduced is apparent.

PERSONS who write to Walt Whitman for his autograph receive in return a printed circular saying that his photograph, bearing his signature may be obtained by sending one dollar to the Orphans' Home at Camden.

THE climate of California holds the lingering Morton enchained. To speak prosaically, he says he won't return to the East, notwithstanding telegrams, until the Congressional Chinese Commission has finished its work.

COLOR is used as a remedy in an insane asylum in Alexandria, Italy. Dr. Ponza, the physician in charge, says that he puts melancholy lunatics into red rooms, and violent maniacs into blue rooms, the results being astonishingly satisfactory.

IN the industrial department of the Kansas State Agricultural College instruction is given in carpentry, cabinet and wagon-making, blacksmithing, turning, dress-making, printing, telegraphy, scroll-sawing, carving, engraving, and photography.

A DELICATE boy, fifteen years of age, attracted a great deal of attention from the passengers on the morning train from Boston to New York recently. He got on at Palmer, Mass., and was on his way to join some exhibition. He only weighed 475 pounds.

HER Majesty Queen Ranovalomanjaka of Madagascar has issued a proclamation to her subjects solemnly warning them not to have anything to do with the cup that inebriates; and she concludes with a caution addressed to those who sell the pestilent beverage.

Implements and Machinery.

Centennial Year of American Independence.

SWITZERLAND to AMERICA, Greeting:

We will call and see you next July and assist at your CENTENNIAL CELEBRATION. By the same opportunity bring you examples of the Celebrated Watches, manufactured by our country-men, the MESSRS. BOREL & COURVOISIER of Neuchatel, for INSPECTION and EXHIBITION. Those Watches are favorably known throughout the U. S., having been sold by our local agents in almost every City, Town and Village the past ten years. Their reputation for accurate performance is universally acknowledged. They are manufactured in Gold and Silver Cases, Stem and Key Winders. These Watches have superior quality of Nickel Movements, Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. use, fine Ruby Jeweled, set in Chaton, and warranted to perform with the regularity and accuracy of a chronometer. Ask your Watchmaker to see them before purchasing those of other makers, as we have been authorized to sell them at a reduction from former prices.

Traveler's Guide.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oskosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO
via Cleveland.
Leaves Erie Railway Depot, foot of Chambers St. New York.

9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only line running Hote Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

ANSWERS TO CORRESPONDENTS.

NOTE.—*All letters of inquiry* MUST BE *accompanied with the name and address of the writer. It is seldom we can name plants from leaves or twigs alone. The flower is generally indispensable.*

E. D. Spaulding, Jamestown, N. Y.—Will the Botanical Editor of the RURAL give the proper name of the vine a slip of which I inclose? This vine grew from an earth bed in a greenhouse, without having been planted, to my knowledge. ANS. It is *Momordica*. The specific name is either *balsamina* or *Charantia*. Without the fruit, we cannot determine which. Had we no knowledge of the plant, it would have been impossible to have traced it from the pressed specimen forwarded. The first is the Balsam Apple from the East Indies; the second, also from the East Indies, is the Balsam Pear. It is a half-hardy annual. [The above was mislaid or it would have appeared some time since.

Querist.—The book of which you inquire, viz., "Garden Flowers, by E. Sprague Rand, Jr.," is merely a reprint of the "Cottage Gardeners' Dictionary," an old English work published about a quarter of a century since. Some American authors have a queer way of appropriating the labors of others without credit and for their own individual benefit, and the author of "Garden Flowers" is one of them.

Vinegarist.—You will find a note on "Grafting Grapes in the Fall" in last week's RURAL. See Vineyard. Any time before the ground freezes will do, but soon after the frosts have killed the leaves is the best time.

J. A. B.—It is claimed that lime sprinkled in among grain at the time of putting it in the bins will keep out the Black and other kinds of weevils. It would probably be a good plan to put lime in the stacks or mow among the grain before it is threshed, as well; but never having had occasion to fight these pests, we can only repeat information gained from other sources in regard to these insects. You and other farmers who have the opportunity should experiment with various preparations for destroying such vermin, and when a good one is discovered, publish it for the benefit of your co-laborers in the same field. We believe that salt would also destroy these weevils if freely scattered about the barn or among the infested grain.

P. R. D.—We have not as yet been able to find any one having Comfrey roots either for sale or exchange. The old beds and clumps which were known to us when a boy have disappeared, but there must be plenty of this old plant about the country somewhere, and we hope some of our readers will look them up and propagate a stock of Comfroy for the benefit of those who would be pleased to purchase a few roots, more or less.

W.—Here is a correspondent who says that he has a few barrels of old cider which he would like to turn into vinegar. Who among our readers will give the desired information? The Vinegar question is quite an important one in many localities and practical information in regard to its manufacture out of various materials is needed very much, although "recipes for making vinegar" are abundant.

E. S.—The caterpillars known as "Woolly Bears in our entomological works belong to the family of ARCTIADÆ, or Arctians, the name coming from the Greek word for bear. The more common name of the imagos or perfect insects is Tiger moths. They fly at night, and the caterpillars, some of the species, are very destructive to vegetables. The common red, hairy caterpillars which are so plentiful in our gardens and fields in the fall, and to which you doubtless refer under the name of "Woolly Bear," produces the Isabella Tiger-moth (*Arctia Isabella*), a very pretty insect, of a grayish tawny-yellow, with a few black dots on the wings, the hinder pair frequently tinged with orange-red.

Emma.—The Abutilon plants which we are now sending out to subscribers are strong blooming plants, growing in four and six-inch pots. They are full of buds as well as flowers, and if kept in a moderately warm room will bloom all winter. The *Abutilon de Neige*, or Snowball Abutilon, is really a grand plant for window culture, and we are quite certain that those of our subscribers who avail themselves of our offer of it will think that in obtaining this novelty they are well paid for their trouble.

Harvey Vandyke.—Thomas Moore was the author of "The Last Rose of Summer." See "Irish Melodies," or "Moore's Complete Poetical Works."

Californian.—The India-rubber Tree (*Ficus elastica*) is as readily grown from cuttings as Willows. Every bud on the stem can be made to produce a plant the same as frequently practiced in propagating grape-vines. Branches of two or three years old may be used for cuttings, or any part upon which buds can be found. We have used pulverized brick in which to strike the cuttings of the India-rubber tree, with excellent success. Take soft, half-burnt bricks and break them up into pieces as small as the grains of buckwheat, and then fill boxes or pots with this material and set the cuttings the same as they usually are in sand. They are less likely to damp off in the brick than in any other material we have ever used for the purpose of striking large and soft-wooded plants.

M. B. Cisco.—Why is the Clematis called Virgin's Bower? ANS.—It was called Ladies' Bower for the reason that the vine is suitable for covering bowers or low trellises. The first Clematis was introduced into England in 1569. It was *C. Viticella*. This was during Queen Elizabeth's reign, who delighted in the name of Virgin Queen. Probably the name of Virgin's Bower was given to this Clematis as a compliment to her and was afterward generally adopted as the familiar name of the genus.

Hazard.—The numberless varieties and diverse forms of the Dahlia are said to have been derived since 1802 from the one yellow *Dahlia variabilis*.

C. L. C.—Yes. The Turf, Field and Farm records that forty thousand six hundred dollars were paid for a cow—the 8th Duchess of Geneva—at sale of New York Mills herd, Sept. 10, 1873.

New Publications.

1850 Twenty-Eighth Year 1877

OF THE

RURAL NEW-YORKER.

THE GREAT ILLUSTRATED AGRICULTURAL AND FAMILY WEEKLY has

REDUCED ITS SUBSCRIPTION PRICE

For 1877.

It is the Standard Authority on AGRICULTURE, HORTICULTURE and DOMESTIC AFFAIRS, and is replete with news and improvements of value to

The Farmer,	The Dairyman,
The Horticulturist,	The Housewife,
The Stock Grower,	The Girls and Boys.

In addition to these Practical Subjects and its Market Reports, several pages are devoted to Household Recipes, pleasant Stories, Reading for the Young, Sabbath Reading, Fashions, News, and all topics of interest to the family. Thus it comprises

TWO PAPERS IN ONE,

and cuts like a two-edged sword into the affections of the ladies and children, as well as the members of the family who seek instruction in their daily avocations.

A. S. FULLER, the celebrated Horticulturist, is Editor-in-Chief, assisted by E. S. CARMAN, the well-known Floriculturist and writer on Rural Topics, and X. A. WILLARD, the great practical Dairyman, who call to their aid as special contributors, S. B. PARSONS, Horticulturist and collector of rare exotics; WILLIAM ROBINSON, Editor London Garden; Col. F. G. SKINNER, Editor Turf, Field and Farm; Prof. CHAS. V. RILEY, Missouri State Entomologist; HERMAN STRECKER, Lepidopterist; WM. J. FOWLER, writer on Farm Economy; THOS. MEEHAN, Editor Gardeners' Monthly; JAMES VICK, the great Rochester Florist; GEO. SUCH, Floriculturist; JOSIAH HOOPES, noted Botanist; S. B. PECK, M. D., writer on Hygiene; HENRY HALES, the practical Poultry Breeder; L. A. ROBERTS, writer on Historical Subjects; and a host of other gentlemen equally celebrated and learned, as well as an efficient corps of Special Reporters, to keep the readers informed upon all subjects of interest to the Rural population.

From the pens of such celebrated writers the Practical and Scientific Departments receive life, while the Literary and Family Departments are under the careful supervision of a corps of experienced Editors and Contributors, who successfully devote their energies to making this Journal the superior of any in the land.

It contains each week sixteen pages of instructive and interesting reading, embellished with fine engravings upon all interesting subjects.

The Reduced Price is only $2.50 a year, postage prepaid by Publishers, and in clubs of ten or more only $2 a year.

The RURAL is so well known that little difficulty is experienced in forming a club in any locality, and every one is invited to form a club—thus securing their paper cheaper and benefiting their neighbors.

Every one can have a specimen copy FREE, and, if they desire to form a club, a list of Premiums to Club Agents, by addressing

RURAL PUBLISHING CO.,
78 Duane St., New York.

PATRON'S POCKET COMPANION.

INDISPENSABLE MANUAL OF THE ORANGE

Complete Manual of the Order, including Parliamentary Laws for the Grange. Price, post-paid, $1.00 in Morocco, or 60 cts. in Cloth. Circulars free. R. W. Carroll & Co., Publishers, Cincinnati.

"Choicest Literature of the Day."—*N. Y. Tribune.*

THE MOST EMINENT living authors, such as Prof. Max Muller, Prof. Tyndall, Rt. Hon. W. E. Gladstone, Dr. W. B. Carpenter, Prof. Huxley, R. A. Proctor, Frances Power Cobbe, The Duke of Argyll, James A. Froude, Mrs. Mulock, Mrs. Oliphant, Mrs. Alexander, Miss Thackeray, Jean Ingelow, Geo. MacDonald, Wm. Black, Anthony Trollope, Matthew Arnold, Henry Kingsley, Francis Galton, W. W. Story, Auerbach, Ruskin, Carlyle, Browning, Tennyson, and many others, are represented in the pages of

Littell's Living Age.

Jan. 1, 1877, THE LIVING AGE enters upon its **132d** volume, with the continued commendation of the best men and journals of the country, and with constantly increasing success.

In **1877**, it will furnish to its readers the productions of the foremost authors **above named and many others**; embracing the choicest Serial and Short Stories by the **Leading Foreign Novelists**, and an amount

Unapproached by any other Periodical

in the world, of the most valuable literary and scientific matter of the day, from the pens of the **leading Essayists, Scientists, Critics, Discoverers, and Editors**, representing every department of Knowledge and Progress.

THE LIVING AGE (in which its only competitor, "EVERY SATURDAY," has been merged) is a *weekly magazine* of sixty-four pages, giving more than

THREE AND A QUARTER THOUSAND

double column octavo pages of reading matter yearly. It presents in an inexpensive form, considering its amount of matter, with freshness, owing to its weekly issue, and with a **satisfactory completeness** attempted by no other publication, the best Essays, Reviews, Criticisms, Tales, Sketches of Travel and Discovery, Poetry, Scientific, Biographical, Historical and Political Information, from the entire body of Foreign Periodical Literature.

It is therefore invaluable to every American reader as the only fresh and *thorough* compilation of an indispensable current literature,—*indispensable* because it embraces the productions of

THE ABLEST LIVING WRITERS,

in all branches of Literature, Science, Art and Politics.

Opinions.

"Simply indispensable to any one who desires to keep abreast of the thought of the age in any department of science or literature."—*Boston Journal.*

"A pure and perpetual reservoir and fountain of entertainment and instruction."—*Hon. Robert C. Winthrop.*

"The best periodical in America."—*Theo. L. Cuyler, D. D.*

"It has an equal in any country."—*Phila. Press.*

"It reproduces the best thoughts of the best minds of the civilized world, upon all topics of living interest."—*Philadelphia Inquirer.*

"The best of all our eclectic publications."—*The Nation, New York.*

"And *the cheapest*. A monthly that *comes every week*."—*The Advance, Chicago.*

"*With it* alone a reader may fairly keep up with all that is important in the literature, history, politics and science of the day."—*The Methodist, New York.*

"The ablest essays, the most entertaining stories, the finest poetry of the English language, are here gathered together."—*Illinois State Journal.*

"*Indispensable to every one who desires a thorough compendium of all that is admirable and noteworthy in the literary world.*"—*Boston Post.*

"Ought to find a place in every American home."—*New York Times.*

Address LITTELL & GAY, Boston.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

"The 'Saturday Journal' is now the Leading Literary Paper."—*Examiner.*

Every farmer who loves a good horse and fair dealing should have it.

The Cheapest of its Class in the World.

Three Dollars a Year, in Advance.

WALLACE'S MONTHLY,
170 Fulton St., New York.

Wit and Humor.

THAT IS MY PLASTER.

He called Sunday night, as had been his custom for several weeks. After they got together alone in the parlor he plucked up courage to the proper point and proposed to her, telling her of the days when every thought was of her, and only her. Then he said:

"Dearest, will you be mine?"

And she said:

"I will."

Then he caught her in his arms, and pressed her drooping face close to his yearning breast.

Tighter still he drew his arm around her.

"My darling," he started to whisper, bending his face close to hers, when her head flew up so suddenly as to catch him under the chin with sufficient force to almost amputate his tongue.

"Oh!" he gasped.

"Phew!" she ejaculated, "why, how you smell!"

"Smell!" he repeated, while his smarting tongue forced the tears to his eyes.

"Yes," she replied, bending her face again to his breast and sniffing expectantly. "Oh, my! it is awful!" she added, as she drew back her head.

He dropped his own nose into the infected neighborhood, took a sniff, and then as his face lighted up, he cheerfully explained:

"Oh, that is my plaster. I put it on for a cold."

"Oh!" said she, in a tone of relief. And again she dropped her head on his yearning breast, only a little higher up, and a little more to one side, while he ran out his tongue and tenderly caressed the wound with his handkerchief. —*Danbury News.*

SPARKS AND SPLINTERS.

Fast living—Hasty-pudding.

Capital wanted: Constantinople for the Russians.

Long-range practice—twenty years experience as a cook.

Four men in England were indicted for stealing beans. "What have they been doing?" asked the judge. "Been stealing," said the clerk.

It was Senator Maxey, of Texas, who, engaged in a brown study in a street car, walked up to the conductor's box and asked for a quarter's worth of chips.
